Economists usually perceive collusion as ‘a situation where firms’ prices are higher than some competitive benchmark. A slightly different definition would label collusion as a situation where firms set prices which are close enough to monopoly prices. In any case, in economics collusion coincides with an outcome (high- enough price), and not with the specific form through which that outcome is attained [. . .] collusion can occur both when firms act through an organised cartel (explicit collusion), or when they act in a purely non- cooperative way (tacit collusion)’²⁰⁹³. For economists, collusion entails a suppression of inter- firm rivalry that leads to an outcome/ equilibrium (higher prices, lower output, lower innovation levels) that would be inferior to the outcome of ‘some competitive benchmark’. The latter concept is broad enough to cover perfect competition, workable competition or the outcome that would have existed, had the examined conduct not taken place. Hence, one may notice that the definition of collusion as a non- competitive market outcome may easily overlap with the question of defining the existence, or not, of a restriction of competition. This does not mean that the two questions are merged into one: the existence, or not, of a non- competitive outcome. It matters, of course, if this outcome is produced by unilateral effects or by coordinated effects, as economic theory distinguishes between the two types of effects. Yet, the definition of what is unilateral or coordinated/ collusive in economics and in law may not be the same, in view of the emphasis put by economics on *effects* or *outcomes* and the relatively cautious approach of the legal system with regard to the requirement of some *form* of conduct. As we will explain in 7.3. the legal approach to collusion usually requires some evidence of communication between the colluding parties, which constitutes the conduct element instigating competition law scrutiny. Communication between competitors, in particular on future their future strategy for pricing and output, is most likely to lead to negative welfare effects, while communication between non-competitors on their future strategy, for instance in a vertical context, may be justified on efficiency considerations. Usually, the welfare effects of such communication are assessed when exploring the existence of a restriction of competition, but the simple evidence of communication may be considered as a sufficient factor to trigger antitrust scrutiny.

Pricing algorithms present some interesting challenges as to the way their effects may be conceptualised according to the existing conceptual categories in both economics and in law. A pricing algorithm is a software program for determining the price of a product or service. It takes data on the market environment, such as cost, sales, inventories, or rival firms’ prices, and assigns own price.²⁰⁹⁴ The use of pricing algorithms obviously brings economic benefits to market participants. On the supply side, algorithms are used to optimize prices and quantities. Pricing algorithms can adjust prices to respond better to changing market conditions. Online retailers use software programs to moni-

²⁰⁹³

²⁰⁹⁴ For a more detailed discussion of the definition and effects of pricing algorithms see e.g. Harrington, J. E. (2019). Developing Competition Law for Collusion by Autonomous Price-Setting Agents., *Journal of Competition Law and Economics*, 14(3), pp. 331-363.

tor prices of their competitors and adjust their own prices in response to the rivals. In addition, algorithms are used to improve the quality of search results or to personalize product recommendations. Consumers also can benefit from the use of algorithms, for example through reduced search and transaction costs as possible information asymmetries between companies and customers can be reduced.²⁰⁹⁵

However, recent economic literature also raises concerns about the potential for algorithms to lead to consumer harm.²⁰⁹⁶ Consumer harm can be related to increased ability of suppliers to extract larger fraction of consumer surplus through excessive pricing or to exploit certain consumer groups through personalized pricing.²⁰⁹⁷ Pricing algorithms that are using personal information of consumers can also bring the prices very close to consumers' maximal willingness to pay effectively approaching monopoly outcome with perfect price discrimination. However, one of the main concerns in the recent economic literature relates to the possibility that pricing algorithms can create new opportunities for collusion. The OECD report published in 2017 stresses that "algorithms are changing the competitive landscape by offering opportunities to firms to achieve collusive outcomes in novel ways that do not necessarily require the reaching of an agreement in the traditional antitrust sense, or may not even require any human interaction." Economic theory suggests that there is a considerable risk that algorithms, by improving market transparency and enabling high-frequency interactions, increase the likelihood of collusion even in markets that would traditionally be characterised by fierce competition. This covers a number of potential issues including both tacit and explicit agreements.

It is also important to distinguish between the use of algorithms to monitor and enforce an existing coordinated strategy and the situations under which pricing algorithms can lead to coordinated outcomes even when each firm is using own pricing algorithms without communication with the rivals. In particular, Joseph Harrington in the article presented at the BCCELE conference in April 2019 identifies three possibilities.²⁰⁹⁸ First possibility is conventional collusion facilitated by coordination on using pricing algorithms that can be pre-programmed to use strategies that facilitate collusion. Second is collusion through third party pricing, e.g. software companies providing competing firms with similar algorithms. Third is algorithmic collusion which is facilitated solely through coordination by sophisticated pricing algorithms without explicit communica-

2095 More detailed discussion of consumer benefits and other effects of algorithms can be found in e.g. OECD (2017) report: "Algorithms and Collusion: Competition Policy in the Digital Age", Paris.

2096 Examples of economic contributions that analyse potential for consumer harm can be found in e.g. Ezrachi, A. (2015), *The Competitive Effects of Parity Clauses on Online Commerce*, Oxford Legal Studies Research Paper No. 55/2015; Ezrachi, A. and M. E. Stucke (2016), *Virtual Competition: The Promise and Perils of the Algorithm-Driven Economy*, Harvard University Press, United States; Ezrachi, A. and M. E. Stucke (2017), *Two Artificial Neural Networks Meet in an Online Hub and Change the Future (of Competition, Market Dynamics and Society)*, SSRN paper, https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2949434; Calvano, E., Calzolari, G., Denicolò, V. and Pastorello, S. (2019). *Algorithmic Pricing and Collusion: What Implications for Competition Policy?*, Review of Industrial Organization, forthcoming.

2097 See for example Competition & Markets Authority (2018): "Pricing algorithms: Economic working paper on the use of algorithms to facilitate collusion and personalized pricing", CMA94, 8th October.

2098 See article entitled "Competition Law and Pricing Algorithms" presented by Joe Harrington at the Bergen Competition Policy conference (BCCELE conference) in April 2019.

tion by humans. The first two relate to explicit collusion and can be considered illegal according to the current antitrust legislation. So the enforcement can rely on the already existing instruments. The last possibility identified by Joe Harrington is a form of tacit collusion among pricing algorithms and under current antitrust law cannot be viewed as illegal.

Moreover, both the use of algorithms to monitor and enforce existing agreements and coordination by pricing algorithms themselves not only facilitates tacit and explicit collusion but also make it more difficult to detect the violations. Detection would become more difficult as there would be fewer opportunities to obtain hard evidence. At the same time the range of detection tools available to competition authorities will have to be expanded including new software screening tools and new regulatory agencies with experience in IT and AI. These agencies should have a capacity and expertise to be able to detect, document and verify the use of prohibited algorithms or algorithms that can be potentially harmful for consumer welfare.

8.2.1. Can Algorithms Collude or Facilitate and Maintain Collusion?

8.2.1.1. Can Algorithms Facilitate Explicit Agreements?

Algorithms may be used as a tool to implement explicit collusion.²⁰⁹⁹ In this respect it is important to discuss the circumstances in which pricing algorithms could increase the stability of a collusive agreement. From an economic perspective, algorithms may make collusive agreements more stable for a number of reasons. Firstly, it can be easier to detect deviations and to respond to them in the presence of pricing algorithms. Secondly, it reduces the chance of errors or accidental deviations. Finally, it reduces agency slack in organizations.

Collusive agreements are only stable if the firms are able to detect when their partners have deviated from the collusive price.²¹⁰⁰ Without detection, one of the firms would be able to lower its price, increase its sales and therefore increase its profits without any negative consequences. This would result in a breakdown of the collusive agreement. Pricing algorithms make the detection of deviations quicker and less costly also due to the greater availability of pricing data, both in terms of speed at which it is communicated and the volume of available data. This makes it easier for competitors to detect and respond to deviations, which stabilizes collusion.

Cartel stability can also be reduced due to 'noisy price information'. This possibility has been discussed in a seminal theoretical work by Edward Green and Robert Porter pub-

2099 See for example the CMA's *Trod Ltd/GB eye Ltd* case or Competition & Markets Authority (2018): "Pricing algorithms: Economic working paper on the use of algorithms to facilitate collusion and personalized pricing", CMA94, 8th October.

2100 For detailed discussion of cartel stability and detection of deviations from collusive agreements see J. Tirole (1988), *The Theory of Industrial Organisation*, Cambridge, MIT Press or to chapter 4 in the book by Massimo Motta (2004), *Competition Policy: Theory and Practice*, Cambridge University Press

lished in 1984.²¹⁰¹ This occurs when firms in the agreement do not receive perfect information about what their co-conspirators are charging due to for example volatile demand or some other market conditions, which can reduce observability of rivals' actions. This might lead to a seller confusing a period of unusually low demand with an attempt to cheat by its cartel partner. Algorithms could make explicit collusion more stable by reducing or eliminating the possibility of such errors. The increased ease and availability of mass data collection makes it easier for firms to identify more precisely the true state of demand and to better understand their competitors pricing behaviour.

Another feature that might reduce the stability of cartels in traditional economic models is "agency slack". It is extensively discussed in the report published by the UK competition authority (CMA) in 2018.²¹⁰² The CMA report states: "This occurs when, although a collusive agreement has been agreed on between senior managers within a firm, salespeople and other non-management employees may have incentives to undermine the cartel. They may do this if they favour immediate payoffs rather than the long-term benefits of maintaining a cartel. For these reasons, they may choose to undercut the collusive price." The CMA report concludes that using algorithmic pricing reduces the possibility that agency slack will lead to the cartel breaking down, because in such an environment, where algorithms and not individual managers take pricing decisions, there is less scope for individuals within an organisation to take pricing decisions, which would contradict long term strategy developed by the higher level management.

8.2.1.2. Can algorithms result in tacit coordination?

In addition to the above described issues with explicit collusion algorithms could lead to tacit collusion, i.e. "coordinated" outcomes with higher prices even when each firm is using the pricing algorithm to make unilateral pricing decisions. In the article published in 2017 in the University of Illinois Law Review Ariel Ezrachi and Maurice Stucke describe several ways in which algorithms could result in the outcome with tacit collusion. Those are "hub-and-spoke", "predictable agent", "the computer as messenger" or "autonomous machine" models.²¹⁰³

One way in which algorithms may lead to a tacitly-collusive outcome is when sellers use the same algorithm or data pool to determine price. Effectively, the same algorithm is used to determine the market price charged by several seemingly independent market players. This is termed "hub-and-spoke" situation in the article by Ariel Ezrachi and Maurice Stucke. If multiple competitors use the same pricing algorithm, they will react in a similar way to external events, such as changes in entry, input costs or demand. Firms would be better able to predict their competitors' responses to price changes. This

would help firms to better interpret the logic behind competitors' strategies and their price setting behaviour, which reduces uncertainty and may help sustain tacit collusion.

Another category is termed "predictable agent" in the article by Ariel Ezrachi and Maurice Stucke. Here, humans unilaterally design pricing algorithms which react to external factors in a predictable way: for example, by pre-programming algorithms to follow "tit-for-tat" strategies. Similar to before this would have the effect of reducing strategic uncertainty, which may help sustain tacit collusion. The algorithms can be programmed to monitor the market prices, rationally follow price leadership, and punish deviations from a tacit agreement. In such an environment even in the absence of explicit communication, tacit coordination appears to be more likely as the price-setting algorithms lead firms to adopt very simple, transparent, and predictable pricing behaviour (like price matching, or price cycles), which can be recognised and followed by other firms.²¹⁰⁴

The third category is often termed "the autonomous machine". In this situation competitors unilaterally design an algorithm to reach a pre-set target, such as the maximisation of profit.²¹⁰⁵ If the algorithm is sufficiently complex, it can learn by itself and experiment with the optimal pricing strategy. There is the possibility that the algorithms may find the optimal strategy to enhance market transparency and tacitly collude. The important difference with the Predictable Agent model is that the algorithm is not explicitly designed to tacitly collude, but does so itself through self-learning. It is similar to the Predictable Agent model in that it would appear difficult to categorise this as a violation of Article 101. The algorithms are not just sustaining existing coordination but generating this coordination themselves. We will come back to this issue in Section 3, where we review theoretical and experimental work on algorithmic collusion.

8.2.1.3. Can algorithms facilitate tacit collusion?

Tacit coordination (or tacit collusion) refers to an anti-competitive market outcome which is achieved without the need for explicit communication between competitors. Below, we consider the reasons why algorithmic pricing may make tacit coordination more likely. The economic literature has identified a number of factors that can influence the likelihood of collusion.²¹⁰⁶ These factors can be roughly divided into three categories (i) market structure, (ii) characteristics of the demand side and (iii) characteristics of the supply side. Examples of the market structure characteristics are number of competitors, barriers to market entry, frequency of interactions and market transpar-

²¹⁰⁴ More detailed discussion of such strategies can be found in e.g. Maskin Eric and Jean Tirole (1988), *A Theory of Dynamic Oligopoly II: Price Competition, Kinked Demand Curves and Edgeworth Cycles.*, *Econometrica*, 56(3), pp.571-599; or Klein, Timo (2018), *Assessing Autonomous Algorithmic Collusion: Q-Learning under Sequential Pricing*, Amsterdam Law School Legal Studies Research Paper No. 2018-15, June.

²¹⁰⁵ Examples of such algorithms can be found in the articles by Calvano, E., Calzolari, G., Denicolò, V. and Pastorello, S. (2018), *Artificial Intelligence, Algorithmic Pricing and Collusion.*, CEPR discussion paper 13405; and Klein, Timo (2018), *Assessing Autonomous Algorithmic Collusion: Q-Learning under Sequential Pricing*, Amsterdam Law School Legal Studies Research Paper No. 2018-15, June.

²¹⁰⁶ The extensive overview of facilitating factors can be found in chapter 6 of Jean Tirole (1988), *The Theory of Industrial Organisation*, Cambridge, MIT Press.

ency. Examples of characteristics of the demand side are developments of demand and demand fluctuations. Examples of characteristics of the supply side are degree of product differentiation, cost symmetry between the companies and intensity of innovation activities.

The OECD report published in 2017 details how the wide adoption of algorithmic pricing by the companies can result in enhanced scope for tacit collusion through greater market transparency, higher frequency of interactions and other facilitating factors. It argues that the incentive of gaining an ‘algorithmic competitive advantage’ result in an industry where all firms collect real-time data on each other and on market characteristics. This “race to the top” in term of data collection increases *market transparency*, which is the one of the main facilitating factors capable of enhancing the likelihood of collusion as well as stability of the collusive agreements that are already formed.²¹⁰⁷

Frequency of interactions is another important facilitating factor. In the past in the absence of algorithms price adjustments and their detection required a significant amount of time and resources. With the use of algorithmic pricing, firms can change the prices of their products much more frequently. As a result, when firms are tacitly colluding using algorithmic pricing, they will be able to detect and respond to deviations from collusive agreements almost immediately. In the limiting case if there is no delay before punishment is implemented, there is also no benefit to deviation and coordination can be established regardless of the market conditions and firms’ characteristics.

A further reason why algorithms may make tacit coordination more likely is that they may be more efficient at *calculating the profit-maximising collusive price* in the absence of an explicit agreement. As Salil Mehra notes in the article published in 2016,²¹⁰⁸ there may be “instances in which humans would be cognitively incapable of assessing their competitors’ responses.” In such cases algorithms may be better able to calculate the profit-maximising price and, hence, avoid undesirable deviations, which should stabilize collusion.

In addition, other factors, such as the *number of market participants*, influence the possibility of collusion. Collusion is typically easier to sustain in more concentrated markets,²¹⁰⁹ because in such markets it is easier to make agreements and monitor compliance.²¹¹⁰ The ability to quickly analyse large amounts of data using algorithms makes it easier to coordinate and monitor the behaviour of a large number of companies. Therefore algorithms can also make collusion in less concentrated markets possible.

2108 Mehra, Salil K. (2016), *Antitrust and the Robo-Seller Competition in the Time of Algorithms*, *Minnesota Law Review*, 100, pp. 1323-1375.

2109 See chapter 4 in Motta (2004) for detailed analysis of the degree of concentration of sustainability of collusion..

2110 In practice and in the experiments with human participants collusion with higher number of players and in the absence of communication is often hard to achieve. See e.g. Fonseca, Miguel A. and Hans-Theo Normann (2012), *Explicit vs. Tacit Collusion – The Impact of Communication in Oligopoly Experiments*, DICE Discussion Paper, 2012. See also Huck, S., Normann, H.T. and Oechssler, J. (2004), *Two Are Few and Four Are Many: Number Effects in Experimental Oligopolies*, *Journal of Economic Behavior & Organization*, 53, 435-446.

8.2.2. Models of Algorithmic Collusion – Can algorithms collude?

This section gives a survey of the literature on the interaction and learning of algorithms in strategic, multi-agent environments. This is important in the context of analysis of collusion or coordination, where several firms are present and interact with each other in a market. There are different strands in the economic literature that have investigated the problem of coordination in oligopolistic markets or in similar strategic situations, such as prisoner's dilemma games. We start by reviewing relevant theoretical contributions and then move to experimental studies that analyse the behaviour of pricing algorithms powered by Artificial Intelligence and Computer Simulations.

The theoretical contributions usually analyse collusion in oligopolies in the framework of repeated games since interaction between the players in markets usually occurs repeatedly over time. In such environments, however, the problem of tractability arises. Since in complex games with many players and various strategies, it is hard to compute equilibria and, moreover, convergence to an equilibrium can take a very long time. Furthermore, even in the simplest two-player, two-strategy repeated prisoner's dilemma, the Folk Theorem shows that there are infinitely many equilibria, that cover the whole spectrum of possible types of behaviour between full cooperation on the one hand and perfect competition on the other extreme.²¹¹¹ The problem is further aggravated in a multi-agent setting.

It has been attempted in game theoretical literature to solve the problem of equilibrium selection in games by relaxing the assumption of perfect rationality. The behaviour characterized by bounded rationality was considered and complemented by the possibility of learning. There are several contributions by Ariel Rubinstein, Itzhak Gilboa or Ehud Kalai that use finite automata, which can be considered as very simple types of algorithms, to model bounded rationality.²¹¹² They study interactive situations in which players are boundedly rational. Each player, instead of optimizing uses the following choice procedure. He first associates one consequence with each of his actions by sampling (literally or virtually) each of his actions once. Then he chooses the action that has the best consequence. The authors define a notion of equilibrium for such situations and study its properties. Those contributions can be viewed at the first attempts to analyse the play of non-cooperative games and their equilibria with the help of simple algorithms playing the game as models of rational players with limited memory and reasoning capacity.

Another theoretical approach proposed in the article by Eric Maskin and Jean Tirole published in 1988 uses sequential (repeated) pricing environment, in which firms set prices

2111 See Fudenberg, Drew and Tirole, Jean (1991), *Game Theory*. MIT Press.

2112 Rubinstein, Ariel (1986), *Finite Automata Play the Repeated Prisoner's Dilemma*, *Journal of Economic Theory*, Vol. 39, pp. 83-96; Rubinstein, Ariel (1998): *Modeling Bounded Rationality*. MIT Press; Gilboa, Itzhak (1988), *The Complexity of Computing Best-Response Automata in Repeated Games*, *Journal of Economic Theory*, Vol. 45, pp. 342-352; Kalai, Ehud (1990), *Bounded Rationality and Strategic Complexity in Repeated Games*, in Tatsuro Ichiishi, Abraham Neyman & Yari Tauman (Eds.), *Game Theory and Applications*, pp. 131-157, Academic Press.

in turns and profits are realized after each turn.²¹¹³ Maskin and Tirole (1988) impose that the strategies of the firms follow the Markov assumption, where prices can only be conditioned on rivals' current prices and not on the past history. They show that in such an environment firms may charge equilibrium prices above static Nash provided they value future profits sufficiently high, which is interpreted as tacit collusion. Type of strategies analysed in Maskin and Tirole (1988) can be viewed as a simple algorithm that both players adopt and follow. More recent work described in the following paragraphs extends this approach and focuses on analysis of algorithms as collusive devices.

In a recent theoretical paper, Bruno Salcedo explores a symmetric dynamic model of price competition with two firms, where firms choose pricing algorithms simultaneously and independently at the beginning of the repeated game.²¹¹⁴ He shows that when four conditions are met simultaneously, namely, firms set prices through algorithms that can respond to market conditions, these algorithms are fixed in the short run, can be decoded by the rival, and can be revised over time, then every equilibrium of the game leads in the long run to monopolistic, or collusive, profits. These findings provide theoretical support for the idea that the optimal use of pricing algorithms is an effective tool for tacit collusion.

Experimental work also attempted to analyse sustainability of collusive strategies and speed of convergence to above-competitive prices by running experiments with pricing agents or pricing algorithms in controlled environments using computer simulations. These contributions normally look at the collusive capacity of algorithms equipped with certain strategies such as 'win-continue lose-reverse' algorithm or 'match low price' (tit-for-tat) algorithm or more advanced type of strategies. More recently, the so-called reinforcement learning received substantial attention in economics literature. Reinforcement learning is the type of machine learning in which agents learn from interacting autonomously with their environment. Q-learning is a popular example of a simple but well-established reinforcement learning algorithm. Q-learning aims to maximize the present value of future rewards for unknown environments with repeated choice. After choosing a price based on current competitor price, algorithm observes own realized profits and competitor response and updates recursively the expected sum of future discounted profits from choosing the price it did. In setting its price, Q-learning makes a continuous trade-off between the perceived optimal price and experimenting with different prices.²¹¹⁵

Among experimental contributions using computer simulations Gerald Tesauro and Jeffrey Kephart in sequential price competition environment show how Q-learning can converge to profitable asymmetric price cycles.²¹¹⁶ They also show that cycles become

shorter and profits increasing if products are more differentiated or consumers are less informed. They require full knowledge of the environment and rival learning. In the quantity competition environment other experimental studies find that a “win-continue-lose-reverse” rule provides joint-profit maximizing convergence.²¹¹⁷ Ludo Waltman and Uzey Kaymak show that Q-learning algorithms may collude on lower quantities, implying higher consumer prices and higher profits.²¹¹⁸ The average profit gain in their experiment is around 60%. Nevertheless, it should be mentioned that Timo Klein (2018) points out that many of these results are either not robust to small fluctuations in the payoff function or do not seem to be based on equilibrium behaviour.

Another recent paper by Timo Klein performs computer simulations in an environment similar to that analysed in Maskin and Tirole (1989).²¹¹⁹ He demonstrates that pricing ‘Q-learning’ algorithms are able to learn to collude on prices. The experiment is performed in a stylized duopoly environment with a homogeneous good, unrestricted production capacity, and with repeated sequential price competition. The results show that independent ‘Q-learning algorithms’ are able to achieve higher-than static prices and profits.²¹²⁰ In his baseline case the levels of profits are roughly midway between the static Bertrand-Nash level and the collusive level. The average profit gain is around 50%. Enlarging the set of actions (possible prices) increases the average profit gain.

In a similar experimental work Emilio Calvano and others analyse whether pricing algorithms can learn to collude and whether pricing algorithms can sustain collusion more often than humans.²¹²¹ They study experimentally the behaviour of algorithms powered by Artificial Intelligence (Q-learning) in a workhorse oligopoly model of repeated price competition. They find that the algorithms consistently learn to charge supra-competitive prices, without communicating with one another. The high prices are sustained by classical collusive strategies with a finite phase of punishment followed by a gradual return to cooperation. The algorithms learn these strategies purely by trial and error, without such strategies being pre-programmed in the design of the algorithm. This finding is robust to asymmetries in cost or demand, changes in the number of players, and various forms of uncertainty. Analysis in Calvano et al. (2018) also suggests that not only pricing algorithms are able to learn to collude, but that they may be better than humans at colluding tacitly. The experimental literature with human participants has consistently found that human subjects are hardly able to coordinate without explicit communication or in a setting with more than two players (see e.g. Huck et al. (2004)).²¹²²

While analysis in this paper shows that some degree of algorithmic (tacit) collusion can still be sustainable in these less favourable setting.

Calvano et al. (2018) also distinguish between ‘adaptive algorithms’ and ‘learning algorithms’. They stress that the biggest challenges to current competition legislation and policy come from the latter. They stress that learning (pricing) algorithms are ‘active learners’, as they are ‘willing’ to adopt strategies that may be suboptimal so as to learn from experience. A learning algorithm “*learns to play optimally from experience*”, which gives such algorithms an advantage over adaptive algorithms in more complex environments. This also allows them to reach a collusive equilibrium without being designed to do so.

To summarise the above discussion we can conclude that existing theoretical models and experimental studies of algorithmic collusion reveal that it is possible for firms using pricing algorithms to reach and sustain collusive outcomes. The algorithms do not even have to be highly complex. Simple ‘win-continue lose-reverse’ algorithms and ‘match low price’ (tit-for-tat) algorithms have been shown to be capable of sustaining collusion. This result has been articulated in Huck et al. (2003).²¹²³ Contributions by Timo Klein (2019) and Emilio Calvano and others (2018) analyse more advanced algorithms using Q-learning techniques. They also show that such algorithms are capable to sustain near collusive (but not fully collusive) outcomes.

8.2.3. Conditions in which Algorithmic (tacit/explicit) Collusion may successfully happen

We can conclude that in markets, which have features that are already viewed as favourable for coordination, algorithmic pricing is more likely to facilitate collusion. These market features, which are also referred to as standard facilitating factors, have been discussed in the book by Massimo Motta published in 2004. Those are high market transparency, high frequency of interactions, low number of competitors, homogeneous products, high observability and high entry barriers. For these markets, the increase in the use of data and algorithmic pricing may be the trigger that could allow suppliers to move to a coordinated equilibrium.

The use of algorithms could also have an impact on the nature of collusion. Especially tacit collusion could occur more frequently in the future because algorithms reduce the need for explicit agreements between companies. In markets, where it is harder to sustain explicit collusion, such as less concentrated markets, markets with differentiated products or more volatile demand, explicit collusion would be replaced by algorithm-based tacit collusion. Moreover, since explicit collusion can also be facilitated by algorithms the overall effect would be an increase in both explicit and tacit collusion.

²¹²³ Huck, S., Normann, H. T. and Oechssler, J. (2003), Zero-Knowledge Cooperation in Dilemma Games, *Journal of Theoretical Biology*, 220, pp.47-54.

In particular in data-intensive sectors such as the digital economy, the use of algorithms can facilitate collusion by automating collusive behaviour and effectively accelerating it. As indicated in the report of the German Monopolkommission published in 2018:²¹²⁴ “algorithms can be designed to give signals to competitors to increase prices. Algorithms can also help to stabilize collusion by collecting information on competitors’ prices and sanctioning deviations from collusive market outcomes more quickly.”

The type and the nature of algorithms used by the companies also can play a significant role. As identified in the work by Emilio Calvano and others (2018) ‘learning algorithms’ pose the biggest challenges to current competition legislation and policy as these algorithms can adopt strategies that may be suboptimal so as to learn from experience. This also allows them to identify the right collusive strategies and following those strategies reach a collusive equilibrium without being designed to do so.

8.3. A Legal Perspective: is the current antitrust law fit for purpose?

Competition law provisions regarding collusive practices, such as Section 1 of the Sherman Act or Article 101 TFEU, traditionally require for a specific conduct to fall under the conceptual category of collusion, or the operational concepts used in the specific legal system to represent different forms of collusion, such as in EU competition law, agreement, concerted practice, or decision of association of undertakings, that there has been some communication between the parties, or that the undertaking(s) involved was at least aware of the conduct planned or put into effect by other undertaking(s) in pursuit of the same objectives or that it could reasonably have foreseen it and that it was prepared to take the risk²¹²⁵. The requirement of some form of conduct from the undertakings involved, and most often some communication between them, may be explained by the tort-law nature of competition law, which requires the identification for the purposes of determining and ascribing liability some fault (including negligence). One may not extend competition law liability too broadly so as to curtail the ability of an undertaking to unilaterally determine the prices it wishes to charge on the market, or its capacity to respond to the pricing strategies of its competitors. This emphasis on some form communication, direct or indirect, has led to a virulent debate on the merits of a communications-based versus an effects-based approach in defining collusion. To the extent that the requirement of communication may limit the possibilities of expanding the scope of the competition law to situations of algorithmic collusion, we need to look closely to this discussion.

2124 See Report of the German Monopolkommission: Algorithms and collusion. Excerpt from Chapter I of the XXII. Biennial Report of the Monopolies Commission (“Competition 2018”) in accordance with Section 44 Paragraph 1 Sentence 1 of the German Act against Restraints of Competition. 8.3.1. Communications-based v. effects-based approaches in defining collusion

In some scholarly work dating from the 1960s, US judge and professor at the University of Chicago Law School Richard Posner has famously argued that oligopolistic price coordination should be considered as an agreement and fall under the scope of Section 1 of the Sherman Act²¹²⁶. Posner lamented “the process by which the rule against price fixing was virtually emptied of any economic content, to become in effect a branch of the criminal law of conspiracies and attempts”, as “it rendered antitrust enforcers virtually helpless to deal with any case of collusive pricing in which the conspirators did not leave behind them a visible trail of communications or acts of concealment”²¹²⁷.

Posner criticized the position of economist Donald Turner, later an Assistant Attorney General in charge of the Antitrust Division of the US Department of Justice, who argued that oligopolistic pricing was inherent in the structure of highly concentrated markets and could not be prevented without changing market structure²¹²⁸. Turner was influenced by Edward Chamberlin’s insights on the existence of oligopolistic interdependence²¹²⁹, who had put forward that conscious parallelism between competitors and identical prices were to be expected in an oligopoly situation, without “overt communication or agreement, but solely through a rational calculation by each seller of what the consequences of his price decision would be, taking into account the probable or virtually certain reactions of his competitors”²¹³⁰. Turner explains that

“(i)n a significant sense, the behavior of the rational oligopolist in setting his price is precisely the same as that of the rational seller in an industry consisting of a very large number of competitors. Both are pricing their products and determining their output so as to make the highest profit, or suffer the least loss, that can be obtained in the market conditions facing them. The rational oligopolist simply takes one more factor into account- the reactions of his competitors to any price change that he makes. He must take them into account because his competitors will inevitably react [...] [I]t can fairly be said that the rational oligopolist is behav-

2126 R.A. Posner, *Oligopoly and the Antitrust Laws: A Suggested Approach*, (1969) 21 *Stanford Law Review* 1562. It is reminded that Section 1 of the Sherman Act forbids contracts, combinations, and conspiracies in restraint of trade.

2127 R.A. Posner, *Oligopolistic Pricing Suits, the Sherman Act, and Economic Welfare: A Reply to Professor Markovits*, (1975) 28 *Stanford Law Review* 903, 904. According to Posner, “whether a case involves oligopolistic pricing without explicit collusion, or overt conspiracy under such favorable conditions as to generate no evidence of conspiracy, is a distinction without a policy difference”.

2128 D.F. Turner, *The Definition of Agreement Under the Sherman Act: Conscious Parallelism and Refusals to Deal*, (1962) 75 (4) *Harvard Law Review* 655.

2129 E.H. Chamberlin, *The Theory of Monopolistic Competition* (Harvard University press, 1933, 1948), 48, defined this situation as following: “(i)f each [seller] seeks his maximum profit rationally and intelligently, he will realize that when there are only two or a few sellers his own move has a considerable effect upon his competitors, and that this makes it idle to suppose that they will accept without retaliation the losses he forces upon them. Since the result of a cut by any one is inevitably to decrease his own profits, no one will cut, and although the sellers are entirely independent, the equilibrium result is the same as though there were a monopolistic agreement among them”.

2130 D.F. Turner, *The Definition of Agreement Under the Sherman Act: Conscious Parallelism and Refusals to Deal*, (1962) 75 (4) *Harvard Law Review* 655, 661.

ing in exactly the same way as is the rational seller in a competitively structured industry; he is simply taking another factor into account, which he has to take into account because the situation in which he finds himself put in there"²¹³¹.

Similar reasons pushed Turner to agree with Carl Kaysen's view that there should not be agreement in the situation of price leadership, where each seller decides that it will be better for him to follow the single judgment of a price leader, or a succession of price leaders, which are usually the dominant and the low-cost firms, even if he disagrees with it²¹³².

Turner considers that such behavior may theoretically be qualified as either individual behavior (although interdependent) or as an "agreement". Yet, he chooses the first option, mainly for the following reasons. First, he thinks it is questionable to call the behavior of oligopolists in setting their prices unlawful when the behavior in essence is identical to that of sellers in a competitive industry"²¹³³. Second, in view of the fact that monopoly and monopoly pricing are not unlawful per se under US antitrust law, "neither should oligopoly and oligopoly pricing, absent agreement of the usual sort" as "(i) t would make no sense to deprive lawful oligopolists – those who have achieved their position by accidental events or estimable endeavor – of the natural consequence of their position if the lawful monopolist is left with his"²¹³⁴. Third, "to hold unlawful the charging of a monopoly price by a monopolist, or the maintaining of noncompetitive prices by oligopolists, would be to invoke a purely public-utility interpretation of the Sherman Act", which Turner finds objectionable, as it is implausible to conclude that Congress intended the courts, under the Sherman Act, to act as price regulators for all businesses possessing substantial monopoly power"²¹³⁵. Finally, for Turner, it was futile to expect an injunction against oligopolistic pricing to be effective, as such an injunction would command the oligopolists to behave irrationally by ignoring the effect of a price cut by one seller on the price and output of the others, would transform courts to public utility commissions and would impose "immense" practical problems, as the courts would have to enjoin undertakings to produce at marginal costs, which are either "theoretically indeterminate", in particular in cases of joint products²¹³⁶, or "practically indeterminate"²¹³⁷.

One may also note the criticisms of Rahl who argued for a requirement of proving an actual agreement for Section 1 to apply, in view of the fact that the Sherman Act is a penal statute²¹³⁸.

2136 These are products that are produced from the same process or operation (i.e., beef meat and leather) and therefore share a common marginal cost curve.

2137 D.F. Turner, *The Definition of Agreement Under the Sherman Act: Conscious Parallelism and Refusals to Deal*, (1962) 75 (4) *Harvard Law Review* 655, 670.

2138 J. Rahl, *Price Competition and the Price Fixing Rule-Preface and Perspective*, (1962) 57 *Northwestern University Law*

Turner was conscious of the fact that market power created by jointly acting oligopolists may escape the scope of Section 1 of the Sherman Act²¹³⁹. However, he objected to the application of Section 1 of the Sherman Act, in view of the difficulty to devise a limiting principle to the prohibition rule. According to Turner,

“(c)hanging conditions and a growing economic sophistication have put heavy pressures on a statute drafted with different circumstances and simpler conceptions in mind; and there have been the usual counter-pressures to keep a statute, particularly a statute that is criminal as well as civil, within at least some traditional bounds. Inevitably the courts have had to struggle with the unhappy dilemma of either drawing lines between different forms of conduct having virtually identical results, or treating different forms of conduct as being the same despite the differences”²¹⁴⁰.

Yet, he considered that other institutional alternatives may offer a solution to this “oligopoly problem”, in particular by attacking such conduct with an unlawful “attempt to monopolize” under Section 2 of the Sherman Act, or with a violation of Section 5 of the FTC Act, which proscribes unfair methods of competition²¹⁴¹. An active merger policy could also provide some prophylactic remedies to the emergence of oligopolies and oligopolistic interdependence²¹⁴². By rejecting inter-dependence as a criterion for the definition of the concept of “agreement” (collusion) under Section 1 of the Sherman Act, Turner indirectly favored the view that would find “agreement” only if there has been some form of communication between the undertakings in question²¹⁴³.

Turner’s view was compatible with the Structure-Conduct-Performance School dominant at the time in US antitrust, which favored structural remedies, the break-up of monopolies and a more expansive enforcement of Section 5 of the FTC Act and Section 2 of the Sherman Act, also to situations of “shared monopoly”. On the basis of this declaration of the inability of Section 1 of the Sherman Act to deal with the “oligopoly problem” and the difficulties of expanding the scope of both Sections 5 of the FTC Act and 2 of the Sherman Act, the White House Task Force on Antitrust Policy (The Neal report in 1968)²¹⁴⁴, and Industrial Re-organization Act proposed by Senator Philip Hart

Review 137, 147.

2139 In his seminal work with Carl Kaysen, in 1959, he concluded as following: “(t)he principal defect of present antitrust law is its inability to cope with market power created by jointly acting oligopolists [...] [W]e believe it is safe to say that a considerable number of industrial markets exist in which oligopolists, acting jointly, possess substantial degrees of market power, which they exercise without engaging in conduct violating the Sherman Act”: C. Kaysen & D.F. Turner, *Antitrust Policy: An Economic and Legal Analysis* (Harvard University press, 1959), 110.

2140 D.F. Turner, *The Definition of Agreement Under the Sherman Act: Conscious Parallelism and Refusals to Deal*, (1962) 75 (4) *Harvard Law Review* 655, 656.

2141 *Ibid.*, 682. Turner, however, accepts the application of Section 1 of the Sherman Act to “agreements or understandings designed to convert an imperfect oligopoly pricing pattern into a perfect one by eliminating uncertainties”. *Ibid.*, p. 673.

2142 C. Kaysen & D.F. Turner, *Antitrust Policy: An Economic and Legal Analysis* (Harvard University press, 1959), 132-133.

2143 In his article, Turner distinguished the situation of horizontal and vertical agreements, his criticism over a theory based on inter-dependence only applying to horizontal collusion.

2144 Phil C. Neal, William F. Baxter, Robert H. Bork & Carl H. Fulda, ‘Report of the White House Task Force on Antitrust Policy’, (1968) 2 *Antitrust Law and Economics Review* 11.

in 1972²¹⁴⁵ suggested the targeted breakup of tightly oligopolistic industries, a prospect that was heavily opposed by antitrust conservatives, influenced by the Chicago school of antitrust economics, whose intellectual influence began to rise in the 1970s²¹⁴⁶.

Richard Posner, as the rest of the Chicago school, were largely opposing the more regulatory approach of breaking up oligopolies followed by the Neal report and Senator Hart, and advanced the view that the oligopoly problem should be dealt under Section 1 of the Sherman Act with behavioral remedies, which was thought of as a more acceptable, because more limited, form of State intervention, in comparison to the structural break-up favored by Turner and the antitrust hawks. Drawing on the work of Chicago economist George Stigler on oligopoly theory²¹⁴⁷, who showed that there are incentives to undercut any above-competitive price, as a rival may “cheat” by lowering prices so as to “steal” market share from its competitors before being detected, Posner argued that “voluntary actions by the sellers are necessary to translate the bare condition of an oligopoly market into a situation of noncompetitive pricing”²¹⁴⁸. According to Posner, “the attractiveness and feasibility of a price-fixing scheme to the sellers in a market are limited by the costs of bargaining to agreement and of enforcing the agreement to prevent cheating”²¹⁴⁹. Hence, contrary to what was thought by Turner, the oligopolist has a “real choice” as it is not irrational for him to decide to set a price that approximates marginal cost, this not being unprofitable in view of the lag between “cheating” (lowering the price to marginal costs) and detection by the other cartelists²¹⁵⁰.

Against the fatalism of the structuralist approach followed by Turner, as the action of the undertakings was pre-determined by the situation of the market, Posner espoused a behavioural approach that emphasised the role of individual agency, even in the context of oligopolistic markets²¹⁵¹. Posner concluded that “oligopolists cannot be presumed always or often to charge supracompetitive prices” but “(l)ike atomistic sellers they must [...] collude in one fashion or another” and that it seems “improbable that prices could long be maintained above cost in a market, even a highly oligopolistic one, without *some* explicit acts of communication and implementation”²¹⁵². Such acts do not only comprise explicit acts of collusion or enforcement, but also a tacit understanding or other forms of “tacit collusion”. For Posner, as “tacit collusion” is “voluntary behaviour”, it should be punished by “appropriate punishment”, like express collusion, as it is as a form of con-

2145 S. 3832, 92nd Congress, 2nd Session (1972).

2146 Turner was an antitrust moderate and did not necessarily adhere to the approach of the Neal Report and the proposed legislation by Senator Hart. Yet, because his article raised the issue of the “gap” in the enforcement of Section 1 of the Sherman Act that had initiated this process of reform of competition laws towards the sense of de-concentration through specific anti-oligopoly legislation, it was attacked by the antitrust conservatives of the Chicago school, such as Richard Posner.

2152 R.A. Posner, Oligopoly and the Antitrust Laws: A Suggested Approach, (1968) 21 Stanford Law Review 1562, 1574.

certed rather than unilateral activity²¹⁵³. Yet, for both forms of collusion, Section 1 of the Sherman Act emerges as *prima facie* the appropriate remedy.

The main difference between “explicit cartels” and “tacit collusion” is that the latter may be more easily concealed, that is a question of proof.²¹⁵⁴ Although he concedes that proving tacit collusion will be difficult, he provides a laundry list of factors that, according to him, may provide evidence of tacit collusion and non-competitive pricing. Posner nevertheless notes that courts will have to exercise extreme care in drawing inferences of tacit collusion from conduct and suggests to “limit inquiry by and large to conduct-how the firms behave-and more narrowly still to conduct from which an absence of effective competition can be inferred: cartel-like conduct”. Turner’s argument on the absence of an appropriate remedy under Section 1 of the Sherman Act is also rejected as not being fatal to a rule forbidding tacit collusion under section 1 of the Sherman Act, in view of the deterrence provided by private treble-damage actions and other Section 1 behavioral remedies. Posner criticised, however, structural remedies, such as the break-up of oligopolies, imposed either through specific legislation or through a more active merger policy against horizontal mergers²¹⁵⁵. In conclusion, for Posner, “if a firm raises price in the expectation that its competitors will do likewise, and they do, the firm’s behavior can be conceptualized as the offer of a unilateral contract that the offerees accept by raising their prices”²¹⁵⁶.

The interpretation of Section 1 of the Sherman Act by US courts has moved to a certain extent in the direction of Turner, although taking a more conservative approach as to the reach of US antitrust law in situations of “tacit collusion”. Although in its seminal case *American Tobacco* in 1946 the US Supreme Court took a broad perspective on the concept of collusion, establishing the basis for an unlawful conspiracy to be inferred circumstantially from the conduct of the relevant oligopolists without direct evidence of formal agreements²¹⁵⁷, the Court refused so far to expand the scope of Section 1 of the Sherman Act in order to cover “mere interdependence” or “tacit collusion”²¹⁵⁸. US anti-

2153 Posner was thus able to infer a “meeting of the minds”, referring to game theory Through the element of conflict, mutual dependence, kind of collaboration and mutual accommodation the oligopoly “game” leads undertakings to communicate by hint and by suggestive behaviour. R.A. Posner, *Oligopoly and the Antitrust Laws: A Suggested Approach*, (1968) 21 *Stanford Law Review* 1562, 1576, footnote 39.

2154 R.A. Posner, *Oligopoly and the Antitrust Laws: A Suggested Approach*, (1968) 21 *Stanford Law Review* 1562, 1575.

2155 It is interesting to note Posner’s assumptions justifying his preference for behavioural remedies: the fact that “behavioral and prophylactic antitrust remedies such as penalties and injunction are swift and relatively costless compared to dissolution proceedings” and the idea that that market processes will usually eliminate an unmeritorious (single or joint) monopoly position: R.A. Posner, *Oligopoly and the Antitrust Laws: A Suggested Approach*, (1968) 21 *Stanford Law Review* 1562, 1597-1598.

2156 *In Re High Fructose Corn Syrup Antitrust Litigation Appeal of A & W Bottling Inc et al*, U.S. Court of Appeals, 295 F3d 652, (7th Cir., 2002).

2157 *American Tobacco Co. v. United States*, 328 U.S. 781, 810 (1946), noting that conspiracy requires only “a unity of purpose or a common design and understanding, or a meeting of minds in an unlawful arrangement”. See also *Interstate Circuit v. United States*, 306 U.S. 208, 226-227 (1939).

2158 See, for instance, *Theatre Enterprises v. Paramount Film Distribution Corp.*, 346 U.S. 537 (1954); *Bell Atlantic Corp. v. Twombly*, 550 U.S. 544 (2007), 554, the Supreme Court noting that “the inadequacy of showing parallel conduct or interdependence, without more, mirrors the ambiguity of the behaviour, consistent with conspiracy, but just as much in line

trust law has not also taken the complementary steps suggested by Turner in order to fill this perceived “gap”, as some efforts to use Section 5 of the FTC Act against “shared monopoly” failed²¹⁵⁹. Yet, it is possible to bring in a Section 5 FTC case against “facilitating practices” even in the absence of proof of conspiracy or, more generally communication, if conscious parallelism produces anticompetitive effects, under certain specific circumstances²¹⁶⁰.

As something more than parallel pricing is required in order to establish the existence of a concerted practice, courts and competition authorities focus on the features of the specific market and other ‘plus factors’. The approach followed consists in attacking indirectly the occurrence of supra-competitive pricing, by focusing on the plus factors that contribute to its occurrence, in general. Hence, these plus factors may constitute competition law infringements. This is possible for certain categories of the plus factors (in particular those that can be characterised as endogenous) but not for all. For instance, it would be difficult to establish liability for a supracompetitive price in an oligopolistic market that results from independent individual reactions to an exogenous change in market supply or demand conditions. Furthermore, elaboration of a list of plus-factors may incur two series of problems as Kovacic et al. indicate:

‘One problem involves the absence of a methodology for ranking plus factors according to their likely probative value. The second problem arises from the suggestion in the economics literature regarding repeated games that market outcomes associated with collusive schemes can result from interdependent, consciously parallel conduct in some industries. [...]

First, courts have failed to present a hierarchy of such factors and to establish an analytical framework that explains why specific plus factors have stronger or weaker evidentiary value. Antitrust agreement decisions rarely rank plus factors according to their probative merit or specify the minimum critical mass of plus factors that must be established to sustain an inference that conduct resulted from concerted acts rather than from conscious parallelism. A relatively small number of judicial opinions have extensively and skillfully evaluated the economic significance of each factor. These opinions stand in contrast to decisions that either fore-

with a wide swath of rational and competitive business strategy unilaterally prompted by common perceptions of the market”. Furthermore, the Court has created a number of procedural hurdles to “hedge against false inferences from identical behaviour at a number of points in the trial sequence”.

2159 See, for instance, the Breakfast cereal case brought by the FTC in 1972 against the breakfast cereal oligopoly, alleging that the undertakings in question enjoyed a “structural shared monopoly” position, maintained through the erection of barriers to entry by a number of marketing strategies employed by all the undertakings, such as the proliferation of brands or the promotion of trademarks through intensive advertising. The case was finally dismissed in 1981, following political opposition in Congress and by the Reagan administration.

2160 See, for instance, *E.I. Du Pont de Nemours & Co. v. FTC*, 729 F.2d 128 (2nd Cir. 1984) where although the court of appeal dismissed the case, it acknowledged that Section 5 of the FTC Act can be violated by “non-collusive, non-predatory and independent conduct of a non-artificial nature, at least when it results in a substantial lessening of competition if “some indicial of oppressiveness” exist, such as evidence of anticompetitive intent, or the absence of an independent legitimate business reason for the conduct.

go a careful discussion of the economic meaning of individual plus factors or attempt such an inquiry without a sure grasp of the economic concepts in question. Such tendencies make judgments about the resolution of future cases problematic and give an impressionistic quality to judicial decision making on agreement related issues. [...]

The second problem results from the development of new arguments, rooted in the modern economics literature dealing with repeated games that market performance associated with collusive schemes can result from interdependent, consciously parallel conduct in some industry settings. Firms in a number of industry settings may be able to achieve collusive outcomes without resorting to conduct that might be characterised as an agreement [or concerted practice]²¹⁶¹.

Commenting on the case law of the US courts, the authors find that '[t]he variation in judicial analyses of plus factors also suggests that the outcome in many agreement cases depends on the Court's unarticulated intuition about the likely cause of observed parallel behavior'.²¹⁶² The authors proceed by putting forward a taxonomy of 'super plus factors', that is, market conditions and conduct that create a 'strong inference of explicit collusion'²¹⁶³, and indicate their respective evidential weight in a finding of concerted practice/agreement. From this perspective, algorithms may be considered as coordination facilitators that may be qualified as 'plus factors', when 'their use must constitute an intended and avoidable act that facilitates coordination by creating conscious commitments to a common scheme, which is not justified on procompetitive grounds'²¹⁶⁴. Of course, caution should be exercised to 'separate any facilitating effects of using a given algorithm from facilitating effects that arise from the conditions of the digital world—e.g., increased connectivity' and 'to differentiate between algorithms that facilitate coordination among competitors, and those that might facilitate coordination among other market players'²¹⁶⁵. The difficulty with treating certain algorithms as plus factors facilitating collusion may nevertheless run the risk of casting 'the net too widely', thus 'creating a chilling effect on welfare-enhancing conduct'²¹⁶⁶. Michal Gal argues for not including algorithms facilitating collusion in the scope of the *per se* prohibition of cartels, but in assessing them separately according to a rule of reason, balancing their negative effects on facilitating coordination with their pro-competitive effects, applying a balance of harm approach, according to the following scheme.

It cannot, however, be excluded that a rule of reason approach will have a chilling effect to the development of algorithms, even if this is certainly lower than if certain algorithms facilitating collusion were prohibited per se. Hence, a structured rule of reason approach relying on rebuttable presumptions might offer a better option, while staying within the traditional communications-based conception of agreement. These presumptions may be designed so as to cover the cases in which there is a higher likelihood that the algorithm forms part of a collusive design. Without suggesting the development of presumptions, Michal Gal lists the following five scenarios that *prima facie* raise may raise concerns and should be the focus of competition authorities²¹⁶⁷:

- ‘Suppliers consciously use similar algorithms even when better algorithms are available to them. The algorithms need not be identical, but their operative part—which calculates the trade conditions—should generate relatively similar outcomes’.
- ‘Firms make conscious use of similar data on relevant market conditions even when better data sources exist. Data is an essential input in the decision-making process, which affects the decision. Using similar data is especially important when prices are based on consumers’ digital profiles. Note that the data sources themselves need not be identical so long as the information gleaned from them is relatively similar’.
- ‘Programmers or users of learning algorithms give them similar case studies from which to learn despite those not being the best-case studies readily available. Learning algorithms change their decision trees based on learning from

²¹⁶⁷ Ibid., 114.

past experience. If fed similar cases, the algorithms may learn similar things and make decisions accordingly’.

- ‘Users take actions that make it easier for their competitors to observe their algorithms and/or their databases, and their competitors take actions to observe them. The algorithm can signal to other market players how its user is likely to react to market conditions, thereby communicating intent and possibly a credible commitment’.
- ‘The user technologically ‘locks’ the algorithm so that it is difficult to change it. This creates a long-term commitment, or a credible threat that can strengthen coordination, generally without a procompetitive justification’.

These scenarios are certainly interesting but developing presumptions out of them may be a step too far, in particular as economists have recently focused their attention on the ‘mechanism of coordination’ which involves a precise description of the means by which coordination would be implemented and sustained as well as the identification of the conditions that would enable the coordination mechanism to be effective and as such these scenarios describe instances of problematic behaviour without however entering into details as to the ‘mechanisms of coordination’ at play in the specific circumstances. But such scenarios may feed into the discussion of the development of ‘super plus factors’ linked to certain uses of algorithms, such as the ones suggested by Gal.

This debate over the scope of Section 1 of the Sherman Act was also relevant for EU competition law. It is reminded that there were no other institutional alternatives in EU competition law to deal with the issue of “conscious” parallel pricing, in the absence of a provision, such as Section 5 of the FTC Act, although the concept of collective dominant position has the potential to cover some of these instances. The CJEU moved to a position closer to that defended by Turner. In the *Sugar* case, although the CJEU rejected the idea that the concept of concerted practices presupposes “a plan and the aim of removing in advance any doubt as to the future conduct of competitors” and found that collusion does not cover “independent” behaviour, it also noted that “this requirement of independence does not deprive economic operators of the right to adapt themselves intelligently to the existing and anticipated conduct of their competitors”, thus raising some doubts as to the inclusion of conscious parallelism resulting from oligopolistic interdependence to the scope of the collusion element under Article 101(1) TFEU²¹⁶⁸. The Court drew the line between collusion and independent behaviour at “direct or indirect contact [...] the object whereof is either to influence the conduct on the market of an actual or potential competitor or to disclose to such a competitor the course which they themselves have decided to adopt or contemplate adopting in the market”²¹⁶⁹. The Court seemed therefore open to attack oligopolistic interdependence, but only in the

2168 Joined Cases 40–48, 50, 54–56, 111 & 113–114/73 *Re the European Sugar Cartel: Cooperatieve Vereniging ‘Suiker Unie’ UA v Commission* [1975] ECR 1663, paras 173–174.

2169 Joined Cases 40–48, 50, 54–56, 111 & 113–114/73 *Re the European Sugar Cartel: Cooperatieve Vereniging ‘Suiker Unie’ UA v Commission* [1975] ECR 1663, para. 174.

presence of some “facilitating device”, if we borrow from the U.S. antitrust jargon, for instance the existence of direct or indirect contacts between competitors²¹⁷⁰.

In *Wood Pulp*, the CJEU moved even further towards the direction of *Turner*, by introducing a sort of oligopoly defence to the finding of collusion. Notwithstanding the presence of advance price announcements and the universal adoption of a basing point system, which could have facilitated the uniform price increases among the main producers supplying the Community pulp market, the CJEU annulled the Commission’s findings, finding that concertation between competitors was not the only plausible explanation for the parallel conduct, which was explained by the high degree of market transparency and by the oligopolistic tendencies of the market as well as by the specific circumstances prevailing in certain periods²¹⁷¹. ‘Unnatural’ parallel conduct therefore plays an evidential role as a ‘form of economic evidence that substitutes for direct documentation of overt communication²¹⁷²’, although it does not substitute for the requirement of conscious parallelism.

Since the *Wood Pulp* case, it has become more difficult to attack tacit collusion with Article 101 TFEU, even indirectly through facilitating practices, although the Court’s approach towards some type of facilitating practices of collusion, such as information exchange between competitors or Resale Price Maintenance clauses between suppliers and distributors, is rather strict, these practices being found anticompetitive by object. One should distinguish nevertheless between the cases where facilitating practices are assessed as a restriction of competition, and the cases where facilitating practices are considered as evidence of collusion.

The communications-based perspective remains a constant for the provisions on anti-trust collusion in all competition law regimes, possibly influenced by the tort-law nature of competition law, what Harrington refers to as ‘the judicial approach’:

Given that mutual understanding is not something that is directly observed, the judicial approach is to focus on communications among firms and to infer a level of mutual understanding from those communications (while possibly supplementing it with market outcomes in drawing those inferences). From this assessment, the courts seek to determine whether the level of mutual understanding among firm is sufficient to produce (or have the capability to produce) coordinated behavior and thereby to be deemed an unlawful agreement. Express communication among firms involving an exchange of assurances (for example, one firm proposes to raise price and the other firm affirms) is clearly viewed as sufficient to conclude that firms have a “meeting of minds” intended to produce a supracompetitive outcome. The real challenge is evaluating situations in which firms do not engage

in such egregious and straightforward means for delivering the requisite mutual understanding²¹⁷³.

Professor Louis Kaplow from Harvard University, criticised the “communication-based” approach in defining collusion/agreement²¹⁷⁴. Kaplow advanced a different approach relying on game theory in order to infer a meeting of minds from oligopolistic interdependence, under certain circumstances²¹⁷⁵. He notes that in an infinitely repeated game, firms may develop strategic thinking allowing them to sustain a non-competitive price by predicting the equilibrium price, not by communicating with their competitors, but by simply relying on a general knowledge of the market and engaging in strategic estimation of their competitors’ choice among a range of possible equilibria, their rivals’ actions being also largely determined by their own strategic predictions as to the actions of their rivals, and so on. The selection of this non-competitive equilibrium is considered as an intersubjective process of mutual understanding among firms that price increases will be at least matched, which may give rise to a meeting of the minds and, consequently, collusion. Kaplow goes as far as denying that communication should be part of the definition of agreement or required for proof of collusion, focusing instead on the following question: are rivals behaving noncompetitively because they have achieved a meeting of minds about their course of action, or are they doing so because they are unilaterally pursuing the same profit-maximising strategies?²¹⁷⁶. Kaplow thus takes an effects-based approach in defining the scope of the collusion concept and links it to the issue of determining the pro or anti-competitive level of prices, which is an issue usually examined when determining the existence of a restriction of competition. By doing so, Kaplow emphasises the need for a nexus between the requirement of collusion, which is a condition for the application of the prohibition rule, and the social harm that motivates the prohibition, for instance the social harm resulting from the elevation of prices as a result of the collusion. He questions the link between the communications-based approach and the social harm of collusion, by raising the “paradox of proof”.

2173 J.E. Harrington, Jr., Exploring the Boundaries of Unlawful Collusion: Price Coordination when Firms Lack Full Mutual Understanding (Working paper, 2012), p. 2

2174 L. Kaplow, Competition Policy and Price Fixing (Harvard University press, 2013).

2175 L. Kaplow, Competition Policy and Price Fixing (Harvard University press, 2013), 38-39, noting that “interdependent behaviour [...] is taken to refer to behaviour that involves coordination with others [...] [T]he thought process involved in such cases is iterative. One party is thinking about what the other is thinking: the second is thinking about what it is thinking, ad infinitum. This subjective state is commonly termed a meeting of the minds [...] In game-theoretic parlance, the situation constitutes an equilibrium”.

2176 Yet, Kaplow excludes mutual understanding over several equilibria from his suggested definition of collusion, even if there are achieved through a meeting of minds between oligopolists, in view of the possibility of errors. For instance, competitive equilibria should not be caught by Section 1, even in the presence of a meeting of minds as enforcement should be limited to instances in which an undertaking has significantly elevated prices. This is also the case for certain non-competitive equilibria, such as monopoly pricing, which is tolerated in US antitrust law, Cournot oligopolies, which are one-shot games and thus cannot be classified as involving interdependent conduct, and Bertrand oligopolies, where firms sell differentiated products at prices above marginal cost, as this sort of pricing is independent, because each seller takes the actions of its rivals as given.

Under the current communications-based approach adopted by both EU and US anti-trust law, if the parallel behaviour of the undertakings in the market may be explained by the oligopolistic nature of the market, there is no collusion, as the behaviour of the undertakings is deemed a natural consequence of the competitive interplay in tight and transparent oligopoly markets. Kaplow finds that the communications-based prohibition is paradoxical, “in the sense that it assigns liability to cases of moderate danger while exonerating defendants in cases posing the highest threat: where the expected likelihood, magnitude, and longevity of price elevation are the greatest”²¹⁷⁷. In contrast, an approach that will focus on the effects of the interaction between firms in an oligopolistic setting, when determining the existence of collusion, will escape the paradox as it will put the social objective motivating the legal prohibition at the centre of the analysis. Such an approach will certainly be incompatible with the “jurisdictional” view of the concepts of agreement, concerted practice and decision of association of undertakings, as it will link the interpretation of the element of collusion to that of restriction of competition. This is not the way most competition law regimes have defined the antitrust concept of collusion.

While the idea of ‘agreement’ as a basis for collusion has been and will continue to be relevant to antitrust, Brazil is a jurisdiction in which there is no need to find an ‘agreement’ for a collusive violation to be configured.²¹⁷⁸ According to art. 36 of Law 12,529/2012, any act which may have the effect of limiting free competition, controlling a relevant market and others may constitute a violation, even if it is unilateral and its effects are not achieved. Having said that, Brazil has no cases tackling algorithmic collusion directly. However, CADE has identified and sanctioned collusion through computer automation as a possible way of coordinating behaviour. One recent case involved three Brazilian airlines (VARIG, TAM, Transbrasil, and VASP) that made use of an automated system to coordinate price fixing agreements²¹⁷⁹. CADE has also investigated two other cases involving the use of software in order to implement price fixing agreements. One of them involved competitors that hired an IT company to develop a software tool that would facilitate the cartel coordination related to driving schools²¹⁸⁰. CADE considered that there was a clear intention of developing an algorithm and a computer program to coordinate

anticompetitive behaviour. In another case, two companies were investigated for being part of a cartel related to vehicle registration plates. The companies used an electronic system to fix the prices of the plates and to prevent companies that were not part of the agreement from receiving orders, thus restricting customers' choice²¹⁸¹.

Article 11.1. of the Russian Federal Law 'On Protection of Competition' prohibits cartels, i.e. agreements between competitors that lead or might lead to one of the anticompetitive effects listed in that Article. As the Russian case law demonstrates, the concept of agreement is central for establishing existence of a cartel, because the competition authority should prove the fact of conclusion of an agreement, in the first place, or participation in it, without the need to prove anticompetitive effects of such agreements on the market.²¹⁸² Therefore, the concept of the classic "cartel" is firmly grounded in the communication-based theory of collusion.

Article 11.1 of the Russian Federal Law 'On Protection of Competition' also sets forth prohibition of concerted practices, for which no agreement is needed, but the actual occurrence of anti-competitive effects must be proven. According to Article 8 of the said law, concerted practices should meet each of the following criteria:

- the result of such actions corresponds to the interests of all participants;
- the actions are known in advance to each of the participants following the public announcement of one of the participants of its intent to perform such actions;
- the actions of each of participants are caused by the actions of other participants (inter-dependency), and not by circumstances that equally affect all competitors in the relevant product market.

Therefore, even for concerted actions, which are mostly in line with the notion of 'tacit collusion', communication between participants (see the condition (ii) – public announcement of intent to perform the concerted action) is essential for the anticompetitive conduct to exist. The parallel behaviour that can be explained by the nature of the market (i.e. circumstances that equally affect all competitors in the relevant product market) falls outside the scope of the prohibited concerted practices.

In India, proof of an agreement is a pre-condition in determining whether a conduct between competitors amounts to a cartel.²¹⁸³ As per Section 3 (3) of the Indian Competition Act, 2002, 'any agreement entered into between enterprises or associations of enterprises or persons or associations of persons or between any person and enterprise or practice carried on, or decision taken by, any association of enterprises or association of persons, including cartels, engaged in identical or similar trade of goods or provi-

2182 See J. Polyakova and K. Podgusova, 'Standard of proof for cartels in judicial practice. When antitrust authorities do not find support from the courts' (2014) N 9 General Counsel.

2183 Vaibhav Choukse, Financial Express, August 2018, available at: <https://www.financialexpress.com/opinion/why-digital-cartelisation-will-be-a-new-challenge-for-the-anti-trust-regime/1278723/>

sion of services (commonly known as horizontal agreements) are presumed to have appreciable adverse effect on competition (AAEC) and, therefore, are anti-competitive and void'.²¹⁸⁴ However, efficiency enhancing joint ventures are exempt from such presumption. Section 2 (c) of the Act defines cartels as 'an association of producers, sellers, distributors, traders or service providers who, by agreement amongst themselves, limit, control or attempt to control the production, distribution, sale or price of, or, trade in goods or provision of services'.²¹⁸⁵ Section 2 (b) of the Act defines agreements to include any arrangement or understanding or action in concert *whether or not it is formal or in writing* or intended to be enforceable by legal proceedings.²¹⁸⁶ The commission has held this definition to not be exhaustive but inclusive to the extent of including a 'nod or a wink'.²¹⁸⁷

Further, the Commission has held that mere exchange of information or presence of an agreement is not sufficient evidence for cartelization but it needs to be followed up with an act done in furtherance to it.²¹⁸⁸ Once that is established, there is a presumption in law that the cartelizing conduct has an AAEC, which is open to rebuttal by the charged parties. In doing so, the applicable standard of proof applied under Indian Competition Law is 'preponderance of probability'.²¹⁸⁹ Thus, the Indian competition law seems to be premised on a communications-based theory of collusion.

For instance, in a recent decision on allegations of algorithmic price fixing ('hub and spoke' type) against the taxi aggregators Ola and Uber (not between Ola and Uber, but individually *qua* their drivers), the Commission observed that 'existence of an agreement, understanding or arrangement, demonstrating the meeting of minds is a *sine qua non* for establishing contravention under Section 3 of Competition Act, 2002'.²¹⁹⁰

It may be noted that "meeting of the minds" observed by the Commission does not seem to be in the same sense as Kaplow has suggested. The "existence of agreement, understanding or arrangement" or in other words, some form of communication still seems to be necessary to establish "meeting of minds".

However, one leeway, where deviation can be made from communication-based theory under the present provisions of the Competition Act, is the construction of the words 'understanding' and/or 'action in concert' featuring in the definition of 'agreement' in Section 2(b) of Act. It may be possible in future that 'understanding' and/or 'action in concert' is construed to include what Kaplow suggests i.e. '[o]ne party is thinking about what the other is thinking: the second is thinking about what it is thinking, ad infinitum. This subjective state is commonly termed a meeting of the minds'. Since the competition law jurisprudence with respect to digital technologies, in general, and algorithmic collusion, in particular, is at a nascent stage in India, time will be a more appropriate teller of India's concrete position on the same.

8.3.2. Conceptual and technological limits of the communications-based approach

Without abandoning the normative core of the communications-based approach, competition law regimes have broadened the concept of collusion to also bring within the prohibition principle not only direct forms of collusion, but also indirect. A classic example is the approaches followed in EU competition law with regard to facilitators of collusive activity. In *Treuhand*, the Commission, confirmed by the CJEU considered Treuhand, a consultancy firm based in Switzerland and offering business management and administrations services, liable, under Article 101(1) TFEU, for a cartel consisting in fixing prices, allocation of markets, customers and exchange of commercially sensitive information between undertakings active in the heat stabilisers sector²¹⁹¹. Although AC-Treuhand did not trade on the relevant markets or on related markets, the Commission found that it played an essential role in the infringement, by organizing meetings for the cartel participants which it attended and in which it actively participated, collecting and supplying to the participants data on sales on the relevant markets, offering to act as moderator in case of tensions between the cartel participants and encouraging the parties to find compromises. The presence of a human agent may indeed orchestrate collusion, making it possible. The literature on cartels has noted the operation in some horizontal price fixing conspiracies of an undertaking/agent, situated at a different relevant market than the one covered by the cartel, whose function is to serve as "an intermediary that speaks individually to each of the competitors and then relays each competitor's agreement [...] to the other competitors in a series of one-to-one conversations"²¹⁹². The main concern of the participants to these conspiracies is to facilitate the implementation of the cartel even if they do not benefit from its effects directly (although they might receive some other form of compensation from the cartel members). The presence of these intermediaries on vertically related upstream or downstream markets or on markets that are simply not related to the one the cartel operates may introduce some non-horizontal/triangular element in the collusion, thus making its qualification more complex, the concerted practice being indirect rather than direct. A common characteristic of these

2191 See, Case C-194/14 P, AC-Treuhand AG v. Commission, [2015], ECLI:EU:C:2015:717.

2192 George Hay, "Horizontal agreements: concept and proof" (2006) Antitrust Bulletin 877, 882

situations of indirect collusion is that the undertakings in this triangular relation are all concerned with the implementation of the horizontal collusion scheme. According to well-established case law, this intermediary may be found to infringe competition law, for instance Article 101 TFEU strictly precludes “any direct *or indirect* contact” between competitors²¹⁹³. This is particularly the case if, for instance, information on future prices is exchanged between competitors through this intermediary. Indeed, even when information is disclosed “indirectly through a common agency (for example, a trade association) or a third party such as a market research organization or through the companies’ suppliers or retailers’ such conduct may well infringe competition law”²¹⁹⁴. There are various examples in the case law where a cartel was structured so as to rely on a third party in an upstream or downstream market, which has been outsourced some typical cartel function (ensuring the logistics of the meetings, monitoring the implementation of a cartel)²¹⁹⁵.

Advances in communication technologies may also change the dynamics of collusion. Information on prices, but also future pricing trends may be posted on web sites, making price signalling easier. Firm representatives may communicate through “facially anonymous” blogs and chat-rooms or web-casts, enabling instant and less traceable communication, than “old-fashioned” press conferences, conference meetings in “smoke-filled rooms” etc²¹⁹⁶. Price fixing through algorithms may replace more classic forms of collusion. This may render detection more difficult for competition authorities which are, at the same time, subject to more extensive due process requirements, as a result of the extension of human/fundamental rights protection for corporate defendants. Other advances in communications, such as e-mails or digitilisation, which facilitate record-keeping may assist competition authorities in the detection of collusive practices.

Indirect collusion may occur with various, even less common, ways of reciprocal contact. This may be accomplished for instance through an IT platform and a pricing algorithm. In E-turas collusion was implemented through the use of a common online travel booking system (called E-turas), used by most travel agents in Lithuania²¹⁹⁷. The director of E-turas had sent an email to the travel agencies having an electronic account in the E-turas system asking them to ‘vote’ on the appropriateness of reducing the discounts offered on booking made through that system. A few days after sending this message, the administrator of E-turas sent through the internal messaging system of E-turas an additional message indicating that a capping of the discount rate will be introduced ‘following the appraisal of the statements, proposals and wishes expressed by the travel agencies’. Travel agents were not prevented from granting their customers greater

2197 *ibid.*, [61].

discounts but in order to do so they were required to take additional technical steps. The Lithuanian Competition Council considered that the travel agents using the E-turas booking system during the period in question had participated, along with E-turas, in an anticompetitive concerted practice, the E-turas system being used as a tool for coordinating the travel agents' actions and eliminating the need for meetings. In a preliminary ruling, the CJEU held that a finding of a concertation between the travel agencies was justified, as they were aware of the content of the message at issue and therefore had tacitly assented to a common anticompetitive practice.²¹⁹⁸ However, it also noted that 'if it cannot be established that a travel agency was aware of that message, its participation in a concertation cannot be inferred from the mere existence of a technical restriction implemented in the system at issue', unless there are 'other objective and consistent indicia that it tacitly assented to an anticompetitive action'.²¹⁹⁹

Collusion may also be achieved, directly or indirectly, through the use of a pricing algorithm. A recent case of price-fixing brought by the U.S. Department of Justice's San Francisco division against an e-commerce executive, Mr Topkins, alleged that the defendant and his co-conspirators adopted specific pricing algorithms for the sale of certain posters at the Amazon Marketplace with the goal of coordinating changes to their respective prices and wrote computer code that instructed algorithm-based software to set prices in conformity with this agreement²²⁰⁰. Uber's surge pricing also constitutes another example in which an algorithm pushes up prices or, as Uber would argue, balances supply and demand when many cars are needed simultaneously²²⁰¹.

Some competition authorities have also cracked down on price signaling using the remedial discretion that they enjoy with regard to facilitating practices, such as public announcements. The European Commission's recent decisions against container liner shipping companies for making regular public announcements of their (intended) future increases of prices through press releases on their websites and in the specialized trade press, provide some further illustrations on the expansion of the concept of anti-trust collusion, although in each of these cases there were identifiable competitors that proceeded to some form of communication (public announcements)²²⁰².

In the Indian Competition Law jurisprudence, the allegations of algorithmic price fixing featured in the case of *Samir Agrawal vs. ANI Technologies Pvt. Ltd. & Uber*.²²⁰³ The informant raised three primary allegations against taxi aggregators Ola and Uber operating in India²²⁰⁴:

2203 *Supra* Note 11.

2204 *Ibid.*

- Cab Aggregators use their respective algorithms to fix prices for every ride and do not allow the drivers to compete on prices. They operate as a Hub and Spoke Cartel where the aggregators act as a Hub for the collusion between the spokes i.e. the drivers.
- Price fixing acts as an imposition of minimum resale price maintenance agreement between the Cab Aggregators and their drivers.
- Owing to information asymmetry, Cab Aggregators possessing considerable personalized information about every rider have been able to price discriminate to the disadvantage of the riders.

On finding no *prima facie* contravention by Ola and Uber, the Commission dismissed the information and made the following observations²²⁰⁵. A traditional understanding of a hub and spoke cartel refers to exchange of sensitive information between competitors through a third party that facilitates the cartelistic behaviour of such competitors. In the present case, a hub-and-spoke cartel would require an agreement between all drivers to set prices through the platform, or an agreement for the platform to coordinate prices between them. The Cab aggregators provide a centralized aggregation function that relies on algorithmic determination of prices and have sole control over prices. Since there is no minimum floor price set by the aggregators, prices are sometimes even lower than the market price and thus, there is no resale of services in the first instance. As regards price discrimination, that was dealt with under Section 4 of the Competition Act which comes into play once dominance is established. Since the two players are not dominant in the market and collective dominance is not recognized under the law, the commission did not delve into the same.

In May 2018, the then Chairperson of the Competition Commission of India ('CCI') informed in conference that the CCI plans to assess algorithms used by domestic airlines for ticket pricing to check for possible cartelisation.²²⁰⁶ However, no report has been released by the CCI in this regard.

Some competition law regimes have gone further than expanding the antitrust concept of collusion, and have developed specific tools to deal with practices facilitating collusion. One may give the example of Section 5 of the FTC Act in the US which prohibits "unfair or deceptive acts or practices in or affecting commerce" and does not require prior to its application evidence of collusive conduct. The Federal Trade Commission has entered into consent agreements in several cases alleging that an invitation to collude through a private or public announcement, although unaccepted by the competitor, violated Section 5 of the FTC Act²²⁰⁷. The FTC explained this case law by the fact that it may

be difficult to determine whether a particular solicitation has or has not been accepted, that even an unaccepted solicitation may facilitate coordinated interaction by disclosing the solicitor's intentions or preferences, and finally the deterrence effect against conduct that is potentially harmful and that serves no legitimate business purpose. If a specific jurisdiction would like to adopt a prophylactic approach, they can develop specific prohibitions and rules concerning facilitating practices, by also extending the scope of the competition scrutiny of oligopolistic structures to also cover unilateral+ conduct, such as invitations to collude or more generally facilitating practices for tacit collusion. However, not all competition law regimes offer the possibility to gauge "attempts" to collude or unilateral information disclosure conduct that may produce anticompetitive effects. This may appear problematic as the increasing levels of economic concentration leave only a few large players in a number of markets, making collusion easier to implement and to sustain. However, one may also argue that there should be a distinction between facilitating practices (e.g. MFN, RPM, information exchange etc.), which even on their own may raise some competition concerns, and the *risk* of conduct facilitating tacit collusion, but cannot be considered on its own as raising anticompetitive concerns.

The important technological progress in artificial intelligence, the development of algorithms and deep machine learning in modern digital economy has brought to the fore new challenges for competition law enforcement in oligopolistic industries²²⁰⁸. Businesses become 'algorithmic' by using algorithms to automatize processes relating to their relations with their customers, suppliers, with the aim to gain an 'algorithmic' competitive advantage against their competitors. Firms' pricing decisions have also been increasingly delegated to software programs that incorporate the latest developments of artificial intelligence. It is the most recent second generation 'learning' pricing algorithms that may pose concerns. Although the use of algorithms to facilitate both collusion and personalized pricing is conceivable in principle, it has been alleged that it is very unlikely to occur in practice²²⁰⁹. This is particularly so with respect to tacit collusion, as the absence of posted prices under personalized pricing would make it very difficult for allegedly colluding firms to observe rivals' prices in order to detect cheating.

McWane, Inc., Docket No. 9351, Opinion of the Commission on Motions for Summary Decision at 20-21 (F.T.C. Aug. 9, 2012) ("an invitation to collude is 'the quintessential example of the kind of conduct that should be . . . challenged as a violation of Section 5'"); In the Matter of Mr. Jacob J. Alifraghis, Also Doing Business As InstantUPCCodes.com, and In the Matter of 680 Digital, Inc., Also Doing Business As Nationwide Barcode, and Philip B. It is clear that the use of pricing algorithms can increase the efficiency of markets as the way firms set prices can be more responsive to changes in demand so that markets clear faster, which is particularly valuable for perishable goods, and, more in general, with respect to how firms manage their inventory. However, they may also increase the risks of collusion, which may escape the scrutiny of competition authorities.

Indeed, 'algorithms make collusive outcomes easier to sustain and more likely to be observed in digital markets'²²¹⁰. This is achieved, first by the capabilities of algorithms 'to identify any market threats very fast, for instance through a phenomenon known as now-casting, allowing incumbents to pre-emptively acquire any potential competitors or to react aggressively to market entry',²²¹¹ thus increasing strategic barriers to entry. Second, they increase market transparency and the frequency of interaction, making the industries 'more prone to collusion'²²¹². Prices can be updated in real-time, 'allowing for an immediate retaliation to deviations from collusion', as well as accurately predicting rivals' actions and anticipating any deviations before these actually take place.²²¹³ Third, they can act as facilitators of collusion in monitoring competitors' actions in order to enforce a collusive agreement, enabling a quick identification of cartel price deviations and retaliation strategies²²¹⁴. Fourth, they may facilitate 'hub and spoke' strategies, the firms in an industry instance outsourcing the creation of algorithms to the same IT companies and programmers²²¹⁵. Fifth, 'signalling algorithms' may enable companies to automatically set very fast iterative actions, such as snapshot price changes during the middle of the night, that cannot be exploited by consumers, but which can facilitate collusion with rivals possessing good analytical algorithms²²¹⁶. Finally, 'self-learning' algorithms may eliminate the need for human intermediation, as using deep machine learning technologies, the algorithms may assist firms in actually reaching a collusive outcome without them being aware of it²²¹⁷. This raises some quite interesting issues with regard to the scope of the concept of antitrust collusion in this situation, to the extent that a firm may make an invitation to collude through this self-learning algorithms, while competitors would accept the offer by using similar algorithms. For some, '[t]his raises the concern of whether the need to address algorithmic collusion should require a new definition of what is an agreement for antitrust purposes',²²¹⁸ and eventually strict liability for the companies designing such algorithms, and/ or those using such algorithms (although this option may considerably increase type I errors, as deep learning algorithms do not provide information about the decision-making process that led to conversion of data inputs into decision outputs). This also raises questions as to the availability of competition law remedies in this case, or the need to move beyond

competition law and regulate more pervasively, through the action of competition authorities and/ or digital regulators, the design and use of algorithms so as to prevent algorithmic collusion.

Another interesting aspect to consider is whether the adoption of pricing algorithms must be common to all competing firms in order to facilitate tacit collusion, or whether the fact that only some of the firms have adopted them would mitigate the risk of anti-competitive effects. In the former case, it could be argued that common adoption would in and of itself suffice to establish the existence of a mutual understanding (ie, a 'meeting of the minds') between rival firms²²¹⁹.

Finally, to the extent that the use of pricing algorithms to facilitate collusion takes place on an electronic marketplace, it is worth asking whether e- marketplace platforms should also face antitrust scrutiny. In other words, should the operator of the e- marketplace have a duty to police whether sellers are coordinating prices through the use of algorithms? This may be so to the extent that the platform operator benefits by being able to charge higher fees to colluding sellers.

For such pricing algorithms, the traditional communications-based approach adopted in competition law may not work. Various regulatory options may be put forward: (i) take a wait and see approach collecting evidence about the real occurrence of algorithmic pricing and the risks for collusion, (ii) prohibit algorithmic pricing (a quite extreme option as pricing algorithms may also improve pricing decisions to the benefit of consumers), (iii) regulate price algorithms *ex ante* with some form of notification requirement and prior analysis by the Commission or national competition authorities, eventually using the procedure of regulatory sandbox²²²⁰, and (iv) we may want to regulate them *ex post* through the application of competition law²²²¹. The following Section examines if the antitrust concept of collusion and its emphasis on communication may take, or not, into account all forms of algorithmic collusion.

8.3.3. Is the antitrust concept of collusion and its emphasis on communication sufficient to take into account all forms of algorithmic collusion?

As previous discussed Joseph Harrington distinguishes between the use of algorithms to monitor and enforce an existing coordinated strategy and the situations under which pricing algorithms can lead to coordinated outcomes even when each firm is using own

2219 For a detailed discussion, see P Siciliani, 'Tackling Algorithmic- Facilitated Tacit Collusion in a Proportionate Way' (9 August 2018) J European Competition L & Practice, available at <https://doi.org/10.1093/jeclap/lpy051>.

2220 See, A Ezrachi & M Stucke, *Virtual Competition: The Promise and Perils of the Algorithm-Driven Economy* (Harvard UP, 2016).

2221 See JE Harrington, *Developing Competition Law for Collusion by Autonomous Artificial Agents* (April 17, 2018) (mimeo) (the author defines collusion as 'collusion is the situation when firms use strategies that embody a reward-punishment scheme which rewards a firm for abiding by the supracompetitive outcome and punishes it for departing from it'. The study defines liability and evidentiary standards for the application of competition law to collusion by autonomous agents).

pricing algorithms without communication with the rivals²²²². In particular, he identifies three possibilities:

- a. The first possibility is conventional collusion facilitated by coordination on pricing algorithms. These practices fall under existing competition law. Hence, they should be considered as illegal and should be enforced in a way similar to current practice of cartel (explicit collusion) enforcement.
- b. The second possibility identified in Harrington (2019) is collusion through third party pricing. It can take various forms. Firstly, the platform can set prices at which the two sides of platform transact. Secondly, pricing can be outsourced to a third party or a software developer, which can appear to be a facilitator of collusive pricing. But then the following questions arise: Is it illegal for platform to control the prices at which the two sides transact? Is it illegal for competing firms to allocate pricing authority to a common third party? Is it illegal to outsource pricing to digital marketing agencies, which set the prices for competitors and maximize a collective objective such as aggregate profits without explicit communication between these competitors? Current law does not provide clear answers to these questions. Nevertheless, it can be argued that these pricing schemes can imply harm to consumers if third parties or software developers deliberately choose to coordinate on prices in order to reduce competition. In this case the third party could be liable for customer damages.
- c. The third possibility is algorithmic collusion which is facilitated solely through coordination by pricing algorithms without explicit communication by humans. When competing firms independently adopt complex pricing algorithms, due to their complexity the behaviour of algorithms is unpredictable from the perspective of the managers. So the manager cannot be made responsible for the collusive strategies developed by algorithms. However, each manager observes the results and can evaluate whether pricing algorithm results in higher profits or not and whether the algorithm has been able to develop collusive pricing strategy or not. Supposedly, manager should be able to at least roughly estimate what are the monopoly prices and profits in a particular industry and compare those to the performance of the algorithm.

The important question arises: Whether collusion by autonomous artificial agents illegal? Harrington (2019) concludes that taking into account current legal rules collusion through the use of artificial algorithms is legal. The reasons are that, firstly, there is no overt act of communication and, secondly, managers acted independently and did not foresee collusion, hence, there is no agreement. On the other hand, he also poses the question: “Why is communicating to collude illegal but colluding is legal?”. Then Harrington (2019) discusses how it can be made illegal. For example, one could introduce a

2222 JE Harrington, Developing Competition Law for Collusion by Autonomous Price-Setting Agents. (2019) 14(3) Journal of Competition Law and Economics 331-363. See also article entitled “Competition Law and Pricing Algorithms” presented by Joe Harrington at the Bergen Competition Policy conference (BCCELE conference) in April 2019.

per se prohibition on certain pricing algorithms that support supra-competitive prices (such as algorithms that use price matching or asymmetric responses). Another possibility that liability would be determined by dynamic testing: entering data into the pricing algorithm and monitoring the output in terms of prices to determine whether the algorithm is prohibited.

Joseph Harrington concludes by summarizing the general competition policy goals in the area of dealing with pricing algorithms. Firstly, it is important to evaluate how coordinating on pricing algorithms affects the efficacy and profitability of collusion. Secondly, he identifies the need to develop rules for how a third party can price when it has competitors as clients. Finally, one of the most challenging tasks is developing competition law for collusion that occurs without human intervention. To answer the question posed in the title of this section we can conclude that the antitrust concept of collusion is not sufficient to take into account all forms of algorithmic collusion. It is probably sufficient for the situations of coordination on pricing algorithms and third-party-pricing. But it is not sufficient for the situation of autonomous tacit collusion by learning algorithms themselves.

8.3.4. Reforming the antitrust concept of collusion

Although there have been suggestions for reforms in the way antitrust collusion is defined, neither the EU, nor the US have so far proceeded in revising the current communications-based approach in defining collusion. However, there have been some reforms introduced in other jurisdictions, and in particular the BRICS.

Although not specifically pertaining to cartels and collusion, in view of the changing business environment, on August 30, 2018 the Indian government formed a Competition Law review Committee²²²³ to review the Competition Act, 2002. Recommendations have been made to the Committee to incorporate provisions for anti-competitive agreements arising due to algorithms, such as artificial intelligence led cartels and machine to machine collusion etc.²²²⁴ The report is yet to be released by the Committee.

FAS of Russia in its recent decisions found Russian subsidiaries of LG²²²⁵ and Samsung²²²⁶ liable for price fixing using pricing algorithms. Since those algorithms allowed companies to monitor whether resellers deviated from recommended retail prices, Russian competition authority considered pricing algorithms to be the tools which facilitated price fixing. In 2019 FAS of Russia issued recommendations titled 'On practices in the field of using information technologies in commerce, particularly, related to use of price algorithms' in order to clarify its views on the use of pricing algorithms.²²²⁷ Although

the LG case was an important precedent for FAS of Russia enforcement practice, this case together with the recent FAS of Russia recommendations is grounded in current legislative framework. FAS of Russia advocated for amending the legislation, but it is unclear whether such amendments will be implemented.²²²⁸ In particular, the Fifth antimonopoly package covered the issue of pricing algorithms: according to the proposal, pricing algorithm is a software to monitor, calculate or control prices, and the use of pricing algorithms, though not per se illegal, aggravates liability when used to restrict competition.²²²⁹ The final draft of the Fifth antimonopoly package submitted to the Government of the Russian Federation does not contain provisions on pricing algorithms. Nevertheless, provisions on pricing algorithms as aggravating circumstances in case of competition law violations are now part of another legislative proposal currently undergoing public discussion.²²³⁰

8.3.5. Concluding remarks: Policy options

So far no one has brought an antitrust case against autonomous colluding algorithms, where autonomous agents could have coordinated their price setting behaviour to maximize their joint profits, i.e. to tacitly collude.²²³¹ One reason is that under current legislation this cannot be considered as a violation of competition law. But even if algorithmic collusion would be considered as a violation of competition law, the problem arises how to verify whether algorithms have in fact colluded and whether the algorithms have converged to collusive prices. Furthermore, even after CA is able to verify that the algorithms have indeed converged to a collusive equilibrium and that it is a potential violation of competition law, the question of liability arises. Who is going to be liable: the programmer of the algorithm or the owners of the firm?

Given the special features of self-learning algorithms described above, in order to avoid the problem of algorithmic collusion altogether, one could prohibit the use of self-learning price-setting algorithms in the first place. This, however, does not seem an acceptable solution because this would also block many efficiencies that these algorithms generate. On the other hand, Ariel Ezrachi and Maurice Stucke suggest condemning or at least challenging the creation of market conditions which lead to sustaining tacit collusion. This relates to the creation of a transparent market in which monitoring and punishment mechanisms are present. This suggestion also does not seem to be feasible as it is not clear what competition authorities could do to reduce market transparency.

Moreover, one should not forget that market transparency may be advantageous for consumers because they can easily compare prices and find the best offer.

Several authors have addressed the possibilities for achieving tacit collusion equilibrium outcomes by algorithms interacting autonomously (i.e. without any instructions from human agents). They have also opened the possibility for some form of ex-ante as well as ex-post assessment and regulation over the type of algorithms being used by firms.²²³²

Emilio Calvano and others (2018) distinguish three possible policy approaches in face of the threat of algorithmic collusion. The first proposal is 'business-as-usual' approach, where algorithmic pricing is regarded as not posing any new problem that cannot be dealt with by current antitrust legislation. In particular, the legal distinction between tacit and explicit collusion is maintained, as attempting to sanction tacit collusion would remain subject to unreasonably high type I and II errors.

The second approach focuses on *ex-ante* regulation, or supervision, of pricing algorithms, which will have to be carried out by a regulatory agency. This agency would have the power to prohibit certain pricing algorithms that have a 'tendency to collude'. This characteristic still needs to be defined. This second approach is also favoured by Joseph Harrington (2019). The third approach calls for an *ex-post* regulation, or control in the way similar to how competition authorities currently deal with antitrust practices. However, the legal standards will have to be somewhat different from the current ones. Perhaps, these standards will have to take a more assertive view towards 'tacit collusion'. Emilio Calvano and others (2018) seem to favour this third approach, where the legal distinction between tacit and explicit collusion would have to be reassessed.

Joseph Harrington (2019) suggests dealing with the problem of liability by restricting the class of allowable algorithms or by prohibiting algorithms with certain features that support prices above the competitive level. He suggests a three-step procedure, to analyse which types or properties of algorithms should be prohibited. This approach is based on a simulated market, where, under a variety of market conditions, the properties of algorithms that lead to a collusive outcome are determined. This simulation would have to be carried out by the competition authorities or a specialized agency. Such an auditing of algorithms, however, is a challenging task as there are so many different algorithms in use which are constantly either modified by the programmers or by self-learning and which might develop new, not yet prohibited properties that could lead to a collusive outcome. The examination of algorithms will have to be carried out regularly and most likely will result in substantial increase in enforcement costs.

This last concern has also been articulated by Joao Gata in the work published in 2019.²²³³ By using results in the theory of computation, Joao Gata shows that ex-ante assessment

2232 Detailed discussion of the pros and cons of this approach can be found in Joao E. Gata (2019), Controlling Algorithmic Collusion: short review of the literature, undecidability, and alternative approaches, REM Working Paper 077-2019, Lisboa, Portugal.

2233 See Joao E. Gata (2019) in footnote 33 or Gata, Joao E. (1995), Infinite Regression in Strategic Decision Making: An Application of Rice's Theorem, Discussion Paper No. 95/38, DERS/University of York, UK..

and regulation of use of algorithms faces serious challenges to its effectiveness due to undecidability results. He stresses that possibility of “an ever-increasing complexity of algorithms employed by firms would pose a serious challenge to the regulatory agency. Prohibited algorithms could be replaced by new ones that could either escape an ex-ante assessment altogether or ... burden again the regulatory agency.” Joao Gata also stresses that ex-post assessment may be constrained as well, since when a specific ex-post investigation by a competition authority is opened, the investigation will involve simulating the behavior of the set of algorithms employed by the different firms as well as determining the counterfactual level of prices (i.e. prices in the absence of any co-operation in the market prior to collusion). The problem is that market data, at least in part, are produced by the algorithms themselves, and may not reflect the true competitive benchmark.

Further Ulrich Schwalbe in his work published in 2018 proposes that “one could consider the option of incorporating legal provisions and constraints at a fundamental level of each algorithm, similar to the three laws of robotics.”²²³⁴ He also stresses that only algorithms that are unable to communicate should be accepted. Otherwise, smart algorithms, which can observe the pricing behaviour of their competitors, could learn to communicate by sending messages encoded in the prices charged, similar to the code bidding observed in procurement auctions. Also additional problem can arise if sufficiently sophisticated algorithms are able to overcome these provisions.

At a more general level, the options for competition law and competition policy to deal with the increasing threat of algorithmic collusion at the moment seem to be rather limited. Algorithmic collusion could be considered as a violation of competition law only if the concept of an agreement is extended to cover also this new type of collusive behaviour. But even then, serious difficulties remain with respect to the detection as well as the verification of algorithmic collusion.

8.4. Blockchain and Collusion

The most obvious concern, raised by both permissioned and permissionless blockchains, is the possible facilitation of collusion. This may result from the public character of the blockchain and the enhanced data visibility that it offers. Indeed, a key characteristic of the most well-known blockchain technologies, those supporting cryptocurrencies, is that all transactions are visible to all users. This increasing sharing of data may accommodate broader public policy to make data more open and less proprietary (e.g. Open Banking), but data transparency may also facilitate collusion between competitors.

If one takes the example of Bitcoin, it could be argued that miners who validate the blocks of the blockchain and maintain its operation may be considered, to the extent that they form independent undertakings, as possibly entering into a collusive arrangement, when they collectively implement the ‘consensus’ reached by the specific Block-

²²³⁴ See Schwalbe, Ulrich (2018), *Algorithms, Machine Learning, and Collusion*, WP Institute of Economics, University of Hohenheim, Germany.

chain protocol, as long as this lead to an output restricting or price setting. Østbye presents the hypothetical of the currency cap used by the Bitcoin protocol, which limits the number of bitcoins to be released to 21 million.²²³⁵ Could this amount to an illegal output restriction? It certainly consists in an output restriction, but it cannot be illegal unless the restriction results from collusive, not unilateral, conduct. The Bitcoin miners contribute to the operation of the Bitcoin blockchain by validating the blocks, thus, exercising an economic activity, to the extent they may receive compensation for this activity. In performing this activity, they abide by the 'consensus' process put in place by the blockchain protocol: can their activity be qualified as unilateral, or can this be considered as coordination amounting to an antitrust agreement/concerted practice?

A second hypothetical raising similar questions would occur in the context of a decentralized blockchain-based marketplace, where data is exchanged by various industry actors, some being competitors, and where value-added services are provided, such as access to the data pool for training better algorithms. An algorithm based on machine learning may set the prices for data via the blockchain protocol, choosing from multiple pricing models.²²³⁶ Would the fact of sharing and pricing this data through this decentralized blockchain-based marketplace constitute a unilateral conduct? Or should we consider the data providers as entering into some form of collusive information exchange-related conduct?

For an antitrust agreement to be formed, it is required, under EU competition law, but also under all other competition law regimes, that there is evidence of the 'concurrence of wills between at least two parties, the form in which it is manifested being unimportant so long as it constitutes the faithful expression of the parties' intention'.²²³⁷ The case law explains that this 'concurrence of wills' materializes through the existence of an offer and an acceptance. However, the interpretation of these conditions has been quite flexible, and even tacit acquiescence has often been found sufficient.²²³⁸

In the EU, it is also possible that the conduct may fit into the category of concerted practice. In this case, it is not necessary to prove the existence of an offer and acceptance, but one should, at least, bring evidence that the concerted action is 'the result of a consensus', which equally encompasses 'tacit approval'.²²³⁹ Returning to our first hypothetical, although the miners have not explicitly acquiesced to the Bitcoin protocol that imposed this output restriction, the fact that they are continuously contributing to its operation may amount to acquiescence, to the extent that their apparently unilateral activity (e.g. validating a block) requires a mutual reliance that other miners will accept the new block, generated by the miner who has been the first to solve the mathemati-

cal puzzle (in Proof of Work –PoW- systems)²²⁴⁰. By authenticating the transaction, they make sure that the proof string really solves the encryption puzzle, these being considered as equivalent to ‘voting’ in favour of the integration of the transaction in the blockchain. Returning to our second hypothetical, it will all depend on the consideration of the practice of sharing data in the decentralized blockchain-based platform as a form of communication between competitors that may be qualified as a concerted practice, to the extent that it is followed by price parallelism implemented through the use of a common learning algorithm.

In view of the subjective element of collusion that requires some evidence that the colluders are at least aware of the collusive scheme or collusive potential they participating to, it becomes important to examine whether the miners (in our first hypothetical) or the service providers (in our second hypothetical) are aware of the anticompetitive nature of the arrangement. This may be inferred by the fact that in both cases, the blockchain protocol is well known in advance, as it is usually published when the blockchain developers release their white paper and further documentation, and its anticompetitive potential may be, more or less easily, assessed. The Bitcoin cap is explicitly mentioned in the Bitcoin protocol. The situation is not as straightforward with the second hypothetical; it will all depend on the design of the pricing algorithm and how much autonomy it is afforded, to the extent that the service providers may not be able to understand how pricing decisions are made. This issue has raised important questions in recent literature focusing on algorithmic collusion.²²⁴¹ If the collusive outcome is just the result of the use of the system (i.e. the ‘learning algorithm’), without any other objective and consistent indicia of collusion, it is unclear how the practice may fall under the scope of the prohibition of collusive practices, at least as evidence of direct collusion.

An additional possibility to bring this under the scope of competition law is to consider it as a form of indirect collusion orchestrated or maintained by a cartel facilitator. A common characteristic of these situations of indirect concerted practice is that the undertakings in this triangular relation are all concerned with the implementation of the horizontal collusion scheme. This is the case if, for instance, information on future prices is exchanged between competitors through this intermediary, which can be found directly liable for the commission of the infringement, to the extent that the subjective element of the offence is satisfied if the conduct of this intermediary is directly linked to the efforts of the cartellists.²²⁴² This broad interpretation of the direct nature of liability leaves open the possibility of broadly interpreting the concept of ‘indirect’ contact. Could this be expanded to impose a fiduciary duty not to infringe competition law to all blockchain intermediaries if they are involved in, or are in contact, with a DLT system that has led to an infringement of competition? Could one compare this situation to that of the parent-

2240 Each node in the blockchain network must solve a complex, resource-intensive cryptographic problem (‘proof of work’) in order for the transaction to be ‘validated’.

2241 Harrington, J. E. (2019). Developing Competition Law for Collusion by Autonomous Price-Setting Agents., *Journal of Competition Law and Economics*, 14(3), pp. 331-363.

2242 See, for instance, the approach followed by the EU Court of Justice in Case C-194/14 P, *AC-Treuhand AG v. Commission*, [2015], ECLI:EU:C:2015:717, notably para. 38.

company vis-à-vis the conduct of its subsidiaries? This is an important issue, that does not only relate to competition law but more broadly raises the issue of the 'distributed liability' concerning the legal risks emerging from the use of blockchain systems.²²⁴³

Returning to our first hypothetical, it is possible that, in view of their contribution to the day-to-day operation of the Bitcoin blockchain, the miners could argue that, despite not having any employment contract, they are, in reality, operating as employees of the blockchain. If they are qualified as employees, under EU competition law, they cannot then be qualified as an undertaking exercising an autonomous economic activity, in the sense of offering goods or services on a market and bearing the financial risk attached to the performance of such activity.²²⁴⁴ Hence, their activity could not be considered as constituting anticompetitive collusion.

One may nevertheless envisage the possibility where a cartel (i.e. explicit collusion) is enforced, not through law as this would be illegal and would constitute a restriction of competition by nature, but through code, by devising a smart contract that will enforce collusion, in particular, if this is coupled with pricing algorithms that are adjusted automatically when the conditions of the smart contract are satisfied. For instance, it is possible to envisage a smart contract between members of a cartel, which could condition the release of a 'guarantee', paid in cryptocurrency by each of the members of the cartel and kept in an 'escrow account' at one of the digital wallets, automatically if certain conditions with regard to the deviation of prices from the cartelised price are identified by one of the parties to this cartel arrangement. The implementation of this smart agreement could be ensured by algorithms relying on off-blockchain data harvested by oracles. Firms may also constitute a federated blockchain (a 'consortium') where they will exchange data on their prices, output in real time and other sensitive, or non-sensitive information. In this case, the arrangement to establish this federated blockchain will constitute an information exchange agreement/concerted practice, that could be qualified as a restriction of competition if certain additional conditions are satisfied.

The context and the nature of the information exchanged will be particularly important in this context. For instance, strategic information, which relates to prices (for example, actual prices, discounts, increases, reductions or rebates), customer lists, production costs, quantities, turnovers, sales, capacities, qualities, marketing plans, risks, investments, technologies and R&D programs and their results, is more likely to produce restrictive effects to competition than exchanges of other types of information. Historic data is unlikely to lead to a collusive outcome as it is unlikely to be indicative of the competitors' future conduct or to provide a common understanding on the market. However, there is no predetermined threshold when data becomes historic, that is to say, old enough not to pose risks to competition. Whether data is genuinely historic depends on the data's nature, aggregation, frequency of the exchange and the characteristics of

2243 For a thorough discussion, see Dirk Zetzshe, Ross Buckley, and Douglas Arner, 'The Distributed Liability of Distributed Ledgers: Legal Risks of Blockchain' (2018) 4 University of Illinois Law Review 1361.

2244 Case C-22/98, Criminal Proceedings against Jean Claude Becu, Annie Verweire, Smeg NV and Adia Interim NV [1999] ECR I-5665.

the relevant market. Finally, exchanges of genuinely public information are unlikely to cause competition law concerns. If the parties form a consortium, this may be analyzed as a cooperative joint venture agreement, under more flexible rules than the prohibition of cartel activity.

One could also think of an additional theory of harm for blockchain-based collusive activity, as a public ledger, visible to all, on which industry data may be published in real time and which could be easily accessible, may *facilitate* collusion. Information exchange may occur at the initial steps of forming a cartel, as the cartelists will need to identify the parameters of their cooperation and the selection of the cooperative equilibrium, for instance, by determining the price or output level of the cartel or of its individual members but may also facilitate the maintenance of the stability of a cartel by supporting the monitoring of any possible deviations from the cartel equilibrium reached by the parties. Would the fact of making data publicly available to a public blockchain constitute, in this case, anticompetitive collusion or would it consist in a unilateral practice that may escape scrutiny?

The issue here would be that the transparency created by the public communication of information between actual or potential competitors in real time may soften competition because it can reduce strategic uncertainty in the market. Again, one may here distinguish between private and public blockchains, the former raising more concerns, from a competition law perspective, than the latter. However, even genuinely public unilateral communication of information between competitors may have the potential to dampen competition, for instance by constituting price signaling capable of facilitating collusion. Again, here the qualification of the practice as collusion will depend on the way the specific competition law regimes deals with price signaling facilitating collusion.

Shifting away from the hypothetical cases and tackling cases currently under investigation, the best available example of possible collusion regarding blockchain and cryptocurrencies is the *UnitedCorp* case, which is pending before the District Court for the Southern District of Florida²²⁴⁵. According to the information available on the case, the plaintiff UnitedCorp sued Bitmain and several high-profile stakeholders on basis of an alleged collusion claim. The facts of the case address that UnitedCorp is a company that offers many blockchain solutions, including cryptocurrency mining systems, which relies on a cryptocurrency known as Bitcoin Cash. By its turn, Bitcoin Cash was a publicly available cryptocurrency that underwent significant changes in 2018, due to a disagreement between its protocol developers. Thus, the cryptocurrency was split in two, known as forks: Bitcoin ABC and Bitcoin SV. At the end, Bitcoin ABC was able to gather larger support and succeeded Bitcoin Cash.

Konstantinos Stylianou reports that UnitedCorp alleges that several players in the blockchain value chain (investors, mining pools, crypto-exchanges and protocol developers) engaged in collusive conducts in order to get miners to support the Bitcoin ABC fork

2245 The Plaintiff's submission to the District Court for the Southern District of Florida can be found here: https://www.morisoncohen.com/siteFiles/files/2018_12_06%20-%20United%20American%20v_%20Bitmain.pdf

rather than the Bitcoin SV fork²²⁴⁶. UnitedCorp submits that the alleged collusion centralized the transactional system and “enabled corruption of the democratic and neutral principles of the Bitcoin Cash network”. In this sense, an alleged consequence of the collusion was that the prices of both forks went below those of the previously unified Bitcoin Cash, resulting in financial harm due to an upsetting of normal market conditions.

There are still many questions opened regarding the case and what its implications will be to antitrust practice and its interface with crypto-economy. The first debate to be cleared is whether or not the plaintiff UnitedCorp has standing under Section 4 of the Clayton Act. Stylianou writes that in order to assess whether there is or not standing, a detailed look into where the Plaintiff fits and its role in the value chain is necessary²²⁴⁷. Questions related to the binding status of Bitcoin’s whitepaper are also raised, due to the allegations that the alleged collusion deviated the mining process from its decentralized and democratic principles. Moreover, the possibility of an exchange to steer transactions from one cryptocurrency to another is also present in the case, considering that UnitedCorp decided to include Kraken, a popular exchange, among the defendants.

The outcome of the UnitedCorp case will certainly have important implications to the analysis of crypto-economy players and how courts assess the structure of the cryptoasset value chain.

8.5. Algorithms: impact on cartel detection, leniency and competition law enforcement against cartels

To detect cartels, competition authorities use retroactive methods, such as signals from whistleblowers, leniency programs, as well as proactive methods like screenings, industry monitoring or combination of both methods.²²⁴⁸ Algorithms may not only affect the way collusion occurs but may also raise interesting questions as to the evolution of competition law enforcement in the digital era. First, they may affect the existing instruments of cartel detection, in particular leniency policy. Second, they may give rise to new tools of cartel detection. Finally, blockchain technology may offer new opportunities to competition authorities for improving their action against cartels.

2246 K. Stylianou, What can the first blockchain antitrust case teach us about the crypto-economy? JOLT Digest. April 26, 2019. Available at: < <https://jolt.law.harvard.edu/digest/what-can-the-first-blockchain-antitrust-case-teach-us-about-the-crypto-economy>>

2247 Stylianou argues that there are at least three possibilities to define the role of UnitedCorp in the value chain: as investor, as miner or as spender. Nonetheless, the author argues that all three possibilities would not satisfy the direct harm requirement.

2248 See OECD. Roundtable on Ex Officio Cartel Investigations and the Use of Screens to Detect Cartels. P. 7. [https://one.oecd.org/document/DAF/COMP\(2013\)14/en/pdf](https://one.oecd.org/document/DAF/COMP(2013)14/en/pdf) For example, FAS Russia and Brazil Administrative Council for Economic Defense use both retroactive and proactive methods for cartel detection.

8.5.1. Implications for leniency policies and detection tools for cartel activity

Both the use of algorithms to monitor and enforce existing agreements and coordination by pricing algorithms themselves not only facilitates tacit and explicit collusion but also makes it more difficult to detect the violations. Detection would become more difficult as there would be fewer opportunities to obtain hard evidence. At the same time, the range of detection tools will have to be expanded including new software screening tools and new regulatory agencies with experience in IT and AI. These agencies should have a capacity and expertise to be able to detect, document and verify the use of prohibited algorithms or algorithms that can be potentially harmful for consumer welfare. Per se prohibition of certain types of algorithms can also be an option.

The implications of autonomous algorithmic collusion by learning algorithms themselves for the design of leniency programs are not very straightforward. Algorithmic collusion does not seem to have a potential to interact with leniency programs as there is no agent who could have reported, since supposedly managers are not aware of near collusive outcomes that algorithms sustain through learning over time. Nevertheless, even if managers notice that this happens and report this to a competition authority, the question arises: would they be able to provide the authority with sufficient evidence to ensure conviction of other cartel members, who supposedly also noticed the collusive outcome sustained by algorithms, but did not report and also did not try to stop the unlawful conduct. Most likely, managers and competition authorities and even new regulatory agencies would already have difficulties to identify which other companies / algorithms are involved.

For other types of practices aided by algorithms the interaction with leniency programs is more straightforward. For collusion facilitated by the use of algorithms (the first possibility identified in Harrington (2019)²²⁴⁹ the current design of leniency programs seems sufficient as in this situation managers are aware of the coordination through the use of similar algorithms. Hence, they can report and obtain leniency or be made liable in case of no reporting. For situations covered by the second possibility identified in Harrington (2019) the design of leniency programs should be revised by extending liability to third party facilitator (such as platform or software developer) and then also allowing facilitator to apply for leniency.

8.5.2. Algorithmic cartel detection

8.5.2.1. Cartel screening: old style

Competition authorities usually rely on 'market-based' evidence focusing on the detection of coordinated oligopolistic price elevation, including 'price patterns' in the industry,

²²⁴⁹ Joseph Harrington, Developing Competition Law for Collusion by Autonomous Price-Setting Agents. (2019) 14(3) Journal of Competition Law and Economics 331-363. See also article entitled "Competition Law and Pricing Algorithms" presented by Joe Harrington at the Bergen Competition Policy conference (BCCELE conference) in April 2019.

evidence of price elevation and facilitating practice.²²⁵⁰ Econometric techniques using a structural approach (focusing on markets with traits thought to be conducive to collusion) have been used to help provide information as to where cartels may be located, as well as logit models or OLS predicting the probability or the number of cartels likely to exist in a specific industry²²⁵¹. Some authors have also emphasised behavioural approaches to detecting cartels, which also require the use of econometric techniques.²²⁵²

Quantitative economic analysis includes, as a first step, an industry analysis with a scoring approach (looking to different variables, such as indicators of price, transparency, concentration and entry) in order to exclude from the sample cases where cartel activity is relatively improbable and, as a second step, a critical event analysis (with a focus on exogenous shocks or structural breaks) testing the collusive against the competitive scenario. The OECD has reported a number of EU member States where cartel investigations were triggered based exclusively on economic indicators.²²⁵³ Most recent research has focused on the role of 'empirical', as opposed to 'structural' screening techniques in uncovering collusive oligopolistic interdependence²²⁵⁴. As it is explained by Abrantes-Metz, '(t)he purpose of screening is not to deliver the final evidence based on which colluders will be convicted, but instead to identify markets where empirical red flags are raised and which are worth further investigations'²²⁵⁵.

8.5.2.2. Cartel screening: existing software tools

Algorithms offer additional opportunities for detecting collusion more accurately on the basis of Big Data evidence. They complement existing digital technologies used for competition law enforcement, such as online whistleblowers tools. Whistleblowers tools are online web forms to inform authorities about competition law violations. Although there have been some earlier examples²²⁵⁶ the EU Commission has introduced this tool

2256 In 2012 an anonymous online whistleblower tool was implemented by the Bundeskartellamt in Germany. See https://www.bundeskartellamt.de/EN/Banoncartels/Whistle-blower/whistle-blower_node.html Since 2017 anonymous whistleblowers tools exist in EU and UK <https://cma-553899.workflowcloud.com/forms/c35b9608-b73d-464c-bbfa-0b3ccd->

as recently as in 2017.²²⁵⁷ As previously discussed screening relies on an econometric analysis of data. However, by-hand econometrics analysis has limitations, as it solely depends on human resources. The Korean Fair Trade Commission (hereinafter KFTC) observes that investigation of possible collusive bidding solely by humans is difficult, as the information 'was usually sent in written form which made it physically impossible for the KFTC to thoroughly review and analyze it'.²²⁵⁸ Digital technology developments shift manual analysis of data to automatic cartel detection. Software screening tools for cartel detection are applied by competition authorities in Russia, Korea, Brazil and the UK. They are currently under development in Spain²²⁵⁹ and Canada²²⁶⁰.

One of the first software screening tool was implemented in Korea in 2006. This software screening tool called Bid Rigging Indicator Analysis System (BRIAS) automatically analyses bid information obtained from 332 Korean public procurement agencies.²²⁶¹ Amongst the successful BRIAS cases is the detection of collusion in the Seoul Subway Line 7 construction.²²⁶² In 2017 two more software tools for cartel screening were introduced: FAS Russia announced the successful implementation of their software screening tool in mid-2017, and the UK Competition and Markets Authority (CMA) shared an open Screening for Cartels tool at the end of 2017.²²⁶³

To date, the software screening tool developed by FAS Russia detected eighty cartels in e-procurement, including the most serious bid rigging in construction and medical supply e-procurements, which amounted to 197 billion rubles (circa \$2 billion dollars).²²⁶⁴

2264 https://fas.gov.ru/news/1690/export_to_file.pdf (in Russian). Moreover, in addition to eighty cartels detected by FAS Russia software screening tool, this tool has detected one more serious cartel: as accentuated by Andrei Tsarikovsky, Deputy Head of the FAS of Russia, Russian software screening tool called 'Big Digital Cat' detected a cartel at the procurement of road repair in Penza. Penza Office of the Federal Antimonopoly Service of Russia (hereinafter Penza OFAS Russia) charged companies which colluded at the procurement of road repair with a fine amounted to 21 billion rubles (282,511.72 EUR at the official exchange rate of the Central Bank of Russia on 25 February 2019). In 2019 Court of appeal upheld the decision of Penza OFAS Russia. See 'Penza OFAS of Russia Charged Companies with Fine Amounted to 21 Billion Rubles' <<https://fas.gov.ru/news/27230>> accessed 30 July 2019.

The success of the FAS Russia screening resulted in a number of institutional changes with the establishment of a new department specializing in the use of the software screening tool.²²⁶⁵ This software tool was named “Big Digital Cat”, as it detects “mouse”, that is cartels, in the digital age.

The Administrative Council for Economic Defense (CADE) in Brazil also developed the screening tool Projeto Cérebro, which was integrated into the federal electronic procurement system Comprasnet in 2018.²²⁶⁶ Projeto Cérebro helped CADE to effectively detect bid rigging in the supply of implantable cardiac pacemakers.²²⁶⁷

Each jurisdiction takes a different approach in designing and implementing their software screening tools. First, screening tools may address different stakeholders. The CMA developed screening tool not only for CMA related work, but also for public and private procurers.²²⁶⁸ This tool should help procurers to flag suspicious procurement exercises in their tenders and notify CMA for further investigation. However, both the decision to use this tool and CMA notification are at the discretion of procurers. In contrast, in Korea, Russia and Brazil, the software tools for cartel detection aim competition authorities. Only competition authorities have direct access to the software tools implemented into the electronic public bidding systems. These software tools automatically transfer bidding information to the competition authorities. Procurers do not have access to the software screening tools.

Second, most competition authorities keep their screening tools private and share neither its source code nor binary executable. However, unlike most countries, the UK screening software is an open source software available for download by interested persons upon request. The black-box approach chosen by most competition authorities aims to avoid disclosure of implementation details to possible colluders. This secrecy makes it difficult for would be colluders to game the screening tool.

Third, software tools developed by competition authorities have different designs, as they differ in both set of collected bidding information and indicators they analyze.

To the best of our knowledge,²²⁶⁹ all parameters analyzed by screening tools might be grouped into four categories:

2265 <https://fas.gov.ru/news/26154> (in Russian).

2268 CMA launches digital tool to fight bid-rigging. Press release. <https://www.gov.uk/government/news/cma-launches-digital-tool-to-fight-bid-rigging>

2269 The CMA provided us access to the software screening tool source code, as the CMA screening tool is an open software available for download upon request. Thus, we analyzed the CMA screening tool source code in detail. Other software screening tools are not publicly available, and we revised them based on the information publicly disclosed by FAS Russia, KFTC and CADE in the conference proceedings and other publications.

- Number and pattern of bidders;
- Suspicious pricing patterns;
- Low endeavor and similar submissions;
- Tenders' history data.

To find suspicious tenders, the CMA screening tool analyses eight criteria and performs four combination tests. The category *Number and pattern of bidders* carries out the following tests: low number of bidders, which is triggered when the number of bidders is less than three; and single bid test. The category *Suspicious pricing patterns* includes: 1. the "winning price is outlier" test, which is triggered when winning price is more than in one standard deviation away from mean price of all bids; 2. The "similar pricing across bids" test is triggered when ratio of prices mean to standard deviation is less than fifteen; 3. the last criterion analyzed in this category is made up costs. This test verifies that all prices in the bid conform to Benford's law. This criterion is unique across software tools developed by other countries. By analyzing frequency of the first digit, it allows one to find out that the distribution of costs listed in the bid consists of made up numbers rather than real prices. The next category analyzed by CMA software tool is the *Low endeavor and similar submissions*. This category includes the following criteria: 1. The fact that there are same authors in more than one bid, which analyses author name according to the metadata of files submitted by the bidders. 2. The "low endeavor losing bids" test, which evaluates the ratio of submitted documents revision count to time spent editing the document. Both values are extracted from submitted documents metadata. 3. The "similar text in losing bids" test, which compares words frequency of two losing bids weighted by the inverse of overall word frequency in all bids.

Since the CMA tool analyses data of a single tender only, it does not carry out any tests from the *Tenders' history data* category. Each criterion is associated with its weight, which is added to the tender's "suspicious score".

Due to the limitations of such a simple linear score computation model, tool developers enriched the list of criteria by four combination tests. Each combination test relies on two basic tests and is triggered when both basic tests are triggered. The CMA combination tests are the following: similar text and word count in losing bids; low number of bidders and made up prices; winning price is outlier and made up prices; made up prices and low effort. While the linear "suspicious score" model appears to be used in all screening tools under review, only the CMA tool employs combination tests to overcome the limitations of the linear model. This makes the CMA tool more flexible.

The FAS Russia tool's developers declared that it relies on the analysis of fifty criteria.²²⁷⁰ Unfortunately, only few criteria have been disclosed. Unlike the CMA tool, the FAS software analyses tenders' history data in addition to the data of the current tender. This feature enables FAS Russia to detect bid rigging techniques that cannot be discovered

2270 Andrey Tsarikovskii, Alexey Ivanov, Elena Voinikanis, Ekaterina Semenova, Andrey Tenishev, Mukhammed Khamukov. Antitrust Regulation in the Digital Age. Competition Enforcement in the Context of Globalization and the Fourth Industrial Revolution. P. 153. doi: 10.17323/978-5-7598-1750-5 (in Russian).

by analysis of a single tender, for example, bid rotation and bid suppression. In the *number and pattern of bidders* category, the FAS tool executes only the “low number of bidders” test. In the “suspicious pricing patterns” category, the FAS tool analyses the difference between the winning bid price and market price. The FAS tool compares bidders’ IP addresses, sets of fonts used in submission, number of characters in submitted documents, and performs a rich analysis of metadata (comparing authors’ name, time of creation, and software version). There is no evidence that the FAS Russia tool analyzes text similarities (unlike the CMA tool), but it appears to perform a deep analysis of implicit similarities (e.g. IP address, fonts, metadata). This approach turns out to be fruitful, as it helped to detect dangerous collusion in the supply of medical expendables’ procurement, which amounted to 197 billion rubles (circa \$ 2 billion).²²⁷¹ Thanks to analysis of historical data, FAS tool can perform tests from the *Tenders history data* category and detect bid rotation and companies which often win tenders.

The Korean BRIAS is a non-public software tool used internally by the KFTC. The tool automatically collects information from the Korean e-procurement system KONEPS, used by multiple Korean procurers. To detect suspicious behavior, BRIAS checks a small number of bidders’ criteria, and the winning price as the outlier criterion. More specifically, the winning price computes the gap between the winning price and the prices of the second and the third bidders. In the *Suspicious pricing patterns* category, similarly to FAS tool it also analyses the number of bids above the market price. The tool also carries out the test from tender’s history data category and detects companies with a high winning rate. A strong point of the BRIAS is its integration with the national e-procurement system, enabling a completely automated screening pipeline.

Projeto Cerebro developed by CADE Brazil collects data for the analysis from 40 databases including prices and public procurement databases.²²⁷² The collected data is used to perform tests from the suspicious pricing patterns category, such as cover bidding and superfluous losing bidders. It also detects low endeavor and similar submissions by searching for text and metadata (author, IP address) similarities. The tool is also advertised to analyze historical data and detect bid rotation, bid suppression and stable market share.²²⁷³ CADE may use the intelligence gathered in this project as a prioritization tool or to enhance formal cases, such as opening *ex officio* investigations to give basis to a dawn raid.

Table 7.1 summarizes the main features of the discussed software screenings.

2271 FAS Russia Deputy Head Andrey Tsarikovskii emphasized the role of FAS Russia software screening in the detection of collusion behavior in the “VALIRIA” and “Egamed” bid rigging case.

Table 7.1.: Comparative table of software screening tools

Analyzed criteria \ Screening tool	UK CMA	Russia FAS	Korea BRIAS	Brazil CADE Projecto Cerebro
Number and pattern of bidders	+	+	+	+
Low number of bidders	+	+	+	+
Single bid	+			
Suspicious pricing patterns	+	+	+	+
Winning price is outlier	+		+	
Non-market bids		+	+	+
Winning price is close to start price		+		
Similar pricing across bids	+			+
Made up costs	+			
Low endeavor and similar submissions	+	+		+
Text similarities	+			+
Similar word count	+	+		
Low endeavor losing bids	+			
Metadata similarities	+	+		+
Same fonts		+		
History of participation		+	+	+
Bid rotation		+		+
Bid suppression				+
Stable market share and/or constant winner		+	+	+
Combination tests	+			

We conclude that no screening tool outperforms other screening tools, since each tool has its strong and weak points. For example, the FAS Russia's tool main advantage is deep metadata analysis (e.g. fonts analysis). The Korea BRIAS' tool strong point is seamless integration with the e-procurement system, uniting administrative agencies, local governments and government companies.²²⁷⁴ The CMA tool uses combination tests, allowing it to overcome the limitations of linear model.

This observation highlights the need for collaboration between competition authorities to develop new generation software screening tools. Moreover, all the tools rely on a large amount of rather simple tests, that can be simply fooled by astute colluders. For example, metadata can be simply forged by bidders, thus rendering metadata-based tests useless. Colluders can also fool made up prices test by generating fake costs according to Benford's law. The wider use of screening tools inevitably leads to growth of

²²⁷⁴ P. 62. OECD 2013.

colluders' awareness and the number of attempts to game these tools. This once again emphasizes the need for a collaborative development of new smarter tools by competition authorities, although one may also see some value in the existence of different systems that may be a source of experimentation.

8.5.2.3. Avenues for future development of software screening

Existing software screenings rely on a linear model and use simple tests, mostly easy to deceive by astute colluders. Big data and advanced machine learning techniques might offer a possible solution to this problem, as they provide the possibility to find nontrivial collusive patterns that econometrics could not foresee and they may build non-trivial tests on these patterns. As we mentioned above, the main advantage of current screening tools is the analysis of large amounts of procurement data, which is infeasible if this was done by humans. Advanced machine learning techniques should enable the employment of effective cartel detection criteria on the basis of Big Data which were previously unknown to econometrics.

However, the transition from a linear model with hand-crafted weights to advanced machine learning techniques (such as neural networks or random forests) requires big training data sets containing examples of collusive and competitive behaviour.

The creation of such data sets demands a huge number of man-hours to analyze procurement data and annotate whether it is competitive or not, and thus requires some collaboration between competition authorities. Rosa Abrantes-Metz analyses the possibilities of machine learning aid in cartel detection asking whether "such a data set exist today – with a sufficient number of cases of both collusion and not-collusion, with the necessary data on price, cost, and drivers of supply and demand – or will we have to wait for it?".²²⁷⁵

To our mind, in order to create a training data set containing collusive examples for neural networks and other machine learning methods, competition authorities should share data on cartels gained by the operation of existing software screenings, such as the Korea BRIAS, Brazil Projeto Cérebro, and FAS Russia software screening tools. Moreover, new suspicious behaviour criteria found during analysis of such a data set should also be shared across borders to improve the screening tools of all countries.

Notably, improvement and wider usage of the software screening tools will make colluders polish bid-rigging techniques to make them invisible to these tools. In its turn, the improvement of bid-rigging methods will require the development of better screening tools. Therefore, we are at the beginning of yet another sword and shield competition between competition authorities and colluders. Finally, to discourage over optimistic expectations from screening tools, we want to emphasize that disregarding any progress made in their improvement, screening tools enable to find only *suspicious* behavior.

2275 Rosa M. Abrantes-Metz & Albert D. Metz. Can Machine Learning Aid in Cartel detection? CPI Antitrust Chronicle July 2018. P. 3. <https://www.competitionpolicyinternational.com/wp-content/uploads/2018/07/CPI-A-M-Metz.pdf>

The final decision whether this is *collusive* behavior, should remain with the competition authority.²²⁷⁶

8.5.2.4. The rise of Auction Robots in Electronic Procurement

Electronic procurement provides an illustration of the way information technologies can be used to promote competition, taking a pro-active rather than a re-active approach.²²⁷⁷ Furthermore, electronic procurement platforms are catalysts for the development of cartel detection software screening tools, since these platforms accumulate historical bidding data in a machine-readable format. Electronic procurement systems improve bidding transparency and availability of information for competitors. As the World Bank explains, '(a)utomation of the procurement transactions reduces human error, enhances the integrity of the data, brings in transparency to the Government procurements and facilitates standardization of processes'.²²⁷⁸

Russia launched its electronic procurement system in 2012. This currently concerns a volume of 9 trillion rubles (circa USD 133 billion) worth *electronic* public procurements, whilst the annual public procurement volume is 25 trillion rubles (circa USD 369 billion, 30% Russian GDP).²²⁷⁹ Thus, the e-procurement volume reaches 10% of the Russian GDP. Despite some undeniable successes, e-procurement systems have so far failed to completely eliminate bid rigging from the procurement process. In Russia bid rigging is still up to 85% of cartel offences.²²⁸⁰ According to FAS Russia, cartel damages amounted to 1.5 – 2% of Russian GDP in 2017. Thus, bid rigging damages still amount to 1.3 – 1.7 % of the Russian GDP.

Colluders are in a close technological race with competition authorities to develop software and algorithm-based tools that would enable them to escape competition law scrutiny. An example of such new approaches to collusion is the rise of auction robots used in e-procurement platforms. Auction robots (auction dynamic pricing agent or dynamic bidding software) are software typically built in the e-procurement system so that auction participants can program for a minimum price and reduction step. The pre-configured auction robot automatically submits bids on behalf of the participant, eliminating the need to observe the evolution of the price during the whole auction process and to submit bids manually. Thus, it saves a lot of manpower for companies that participate at multiple auctions at once.

2276 Lianos, Ioannis and Genakos, Christos, *Econometric Evidence in EU Competition Law: An Empirical and Theoretical Analysis* (October 1, 2012). CLES Research Paper series 06/12. Available at SSRN: <https://ssrn.com/abstract=2184563> or <http://dx.doi.org/10.2139/ssrn.2184563>.

2278 World Bank Group. Case Study on eProcurement in GoAP, <http://siteresources.worldbank.org/INTEGOVERNMENT/Resources/APeProcurement.doc>

2279 Head of FAS Russia Cartel Office Andrei Tenishev Shared an Experience on Fighting Digital Cartels, <https://fas.gov.ru/news/24373> (in Russian)

2280 Federal Antimonopoly Service of Russia. Twelfth Annual Report on Competition In Russian Federation. August 2018, http://d-russia.ru/wp-content/uploads/2018/09/12_Doklad_o_razvitii_konkurentcii_FAS.pdf (In Russian).

Auction robots might be either built-in software (like auction robots built in the Russian e-procurement systems Sberbank-AST and RTS-Tender, which automate bid submission), or standalone third-party software agents, which run on users' premises and automate bid submission by communicating with procurement platforms. Such stand alone agents were described in a US patent application²²⁸¹ and are also widely used as eBay auction snipers (e.g. Auction Auto Bidder).²²⁸²

The use of auction robots is not in itself illegal. However, auction robots appear to be not only a tool to automate competitive behavior, but also a tool to automate collusive behavior. The Russian competition authorities (both FAS Russia and Offices of the Federal Antimonopoly Service) have recently dealt with four cases involving auction robots in reverse auctions, that is auctions in which suppliers compete for the buyer and decrease price.²²⁸³

The first case on collusion facilitated by the use of auction robots was decided by the Murmansk Office of the Federal Antimonopoly Service of Russia (hereinafter Murmansk OFAS Russia) in May 2016.²²⁸⁴ In this case two bidders ("ORKO-Invest" LLC and "TSOO" LLC) colluded at 25 e-procurement auctions on solid domestic and medical waste removal. At these auctions "ORKO-Invest" and "TSOO" agreed to maintain high uncompetitive prices by implementing bid rotation – a classic bid-rigging technique. This classic bid-rigging scenario might be performed without any specific software tools. What makes this case special is the auction robots that the companies used to facilitate bid rigging. "ORKO-Invest" and "TSOO" used auction robots built in the electronic procurement system Sberbank-AST.²²⁸⁵ This procurement system provides an opportunity for all bidders either to submit bids manually or to use auction robots to automate bids submission. In this case, colluders preferred to use auction robots in 22 out of 25 auctions. Under the Rules of the Sberbank-AST e-procurement system, any auction participant may use auction robots.²²⁸⁶ Intent to use such a robot and to be bound by the bids submitted by this robot is demonstrated by the electronic signature of the participant. To activate a robot, the participant should set the price decrement step and the minimal price. During the

auction, the robot submits bids once per two minutes. If more than one participant uses robots, these robots submit bids sequentially (i.e. one after another) in the order these robots were created. However, at any time during the auction the participant may switch from the automatic to the manual bids' submission. In 22 auctions "ORKO-Invest" and "TSOO" had created auction robots right after they submitted an application to participate in the auctions. Once the auction robots are set, colluders do not need to adopt any additional action. Hence, auction robots help colluders to automate bid submission and make the process of bid rigging much easier. However, "ORKO-Invest" and "TSOO" ignored the flip side of the bid rigging via auction robots, as these robots provide additional evidence of collusive behavior for competition authorities. In particular, Murmansk OFAS Russia concluded that these colluders used the bid rotation technique: in some auctions "ORKO-Invest" was the winner, as it programed robot for 1% decrease from the start price, while "TSOO" programed its robot for only 0.5% decrease, and vice versa. In each of the 22 auctions these companies used the same collusive technique preselecting the winner and contract price at the moment of the creation of the application. Murmansk OFAS Russia also found that robots configurations and bids for both companies were submitted from the same static IP address. In addition, the competition authority relied on suspicious behavior patterns from the companies, as they used bid rotation scenario via auction robots only when no other companies outside the cartel participated at the auction. However, if other independent bidders took part in the auction, "ORKO-Invest" and "TSOO" actively competed in manual mode decreasing starting price more than twice. This evidence in addition to qualitative evidence e.g. auction documents submitted by colluders that had text similarities made the Murmansk OFAS conclude that the companies had entered into a collusive agreement on price fixing.

In a more recent case decided by FAS Russia in April 2018²²⁸⁷ two companies ("VALIRIA" LLC and "Egamed" LLC) colluded at 14 auctions for the supply of medical expendables for the operations of stenting of coronary, carotid arteries and other operations in 2016.²²⁸⁸ These companies were awarded contracts for 197 billion rubles. "VALIRIA" and "Egamed" preferred to facilitate bid rigging via auction robots in 12 out of 14 auctions. As in the previous case, colluders used built-in auction robots of the electronic procurement platform Sberbank-AST. However, in this case colluders exposed various tactics in different auctions switching between manual bidding or automatic bidding and implementing either bid rotation or a bid suppression technique. First, in five auctions both companies set their robots for 0.5% decrease of the start price. According to the rules of the Sberbank-AST procurement platform, in case the bids are equal, the winning bid is the bid that has been submitted earlier. The rules clarify that auction robots submit bids sequentially depending on the robot's ID assigned at the moment of the robot's creation. In these 5 auctions "VALIRIA" was awarded the contracts, as its robots were

2287 FAS Russia Case № 1-11-166/00-22-17, <https://solutions.fas.gov.ru/ca/upravlenie-po-borbe-s-kartelyami/ats-30960-18> (in Russian). See also: THE RUSSIAN COMPETITION AUTHORITY OPENS A PROCEEDING AGAINST A CARTEL THAT USED AUCTION ROBOTS (EGAMED), <https://www.concurrences.com/en/bulletin/news-issues/november-2017/the-russian-competition-authority-opens-a-proceeding-against-a-cartel-that-used>

2288 Case against a cartel that used auction robots, <https://en.fas.gov.ru/press-center/news/detail.html?id=52369>

created earlier than “Egamed” robots, and “VALIRIA” robots were considered to have submitted bids earlier than the “Egamed” robots according to Sberbank-AST rules. Second, in four other auctions, “VALIRIA” and “Egamed” used the *bid rotation* technique by setting their robots either to 0.5% decrease for “VALIRIA” and 1% decrease for “Egamed” or 1% decrease for “VALIRIA” and 0.5% decrease for “Egamed”. Third, in yet another auction “VALIRIA” and “Egamed” used the *bid suppression* technique, since “Egamed” set the robot at 1% decrease whilst “VALIRIA” abstained to submit any bids. Fourth, in one auction “Egamed” set robot for 0.5% decrease of the start price, and “VALIRIA” set price at 1% decrease *manually*. Moreover, in one more auction “VALIRIA” set 0.5% price decrease and “Egamed” – 1% price decrease. However, independent parties which took part in this auction continued to compete and decrease price. This made “Egamed” manually set the price decrease at 11%.

In contrast to the previous case decided by Murmansk OFAS in 2016, when colluders used auction robots to automate only the bid rotation technique, in this case “VALIRIA” and “Egamed” used algorithms for more complicated tactics, including bid suppression automation. Likewise to the previous case decided by Murmansk OFAS in 2016, in case at hand the FAS Russia found that “VALIRIA” and “Egamed” robots submitted bids from the same IP address, and both companies used this IP address to sign awarded contracts. Furthermore, companies’ auction applications had text similarities (e.g., in most auctions both companies use the same account – Tanya – to create or modify applications). FAS Russia also proved that the Head of “Egamed” was cofounder of “VALIRIA”.

Significantly, this case provides further details on auction robots’ contribution to prove collusive intent of companies by competition authorities: in this case both companies set auction robots, however they preferred to disable robots and switch to manual mode to actively compete and decrease price when independent participants took part in the auction. The question is whether such a suspicious behavior is intentional or might be justified by market reasons: for example, for all intents and purposes companies could not decrease price in some auctions more than 1% due to costs and other expenses whilst in other auctions (which were auctions with independent participants only by random coincidence) companies could significantly decrease price, as contract costs were not very high for them. Disabling robots and switching to manual mode by colluders provided further evidence for FAS Russia, as robot’s pre-programmed settings demonstrated the colluders’ initial intent to fix price at certain level (at 1% decrease of the start price). Having robots pre-programmed, colluders could not justify their suspicious behavior (such as only 1% price decrease of the start price in the absence of other participants, and a significant price decrease when independent companies participated in the auctions) referring to market reasons, since robots settings programmed before the beginning of the auction showed that companies intended to fix prices as they used to do in previous auctions, and only independent participants which continued to compete made colluding companies to further decrease prices. Notably this case is one of the cases that was detected by the FAS Russia software screening tool.

In 2018, the Offices of the Russian Federal Antimonopoly Service faced two more cases

on auction robots automating bid rigging. Perm OFAS identified suspicious pricing patterns in 10 auctions on the supply of materials for medical laboratories: two companies set auction robots identically at 0.5% decrease of the starting price.²²⁸⁹ As bids were similar, the winner was a company which had created an auction robot earlier, because this robot submitted first a bid under the rules of the procurement system. In this case both colluders cooperated with Perm OFAS and confessed the infringement.

An additional auction robots case is under consideration by Yaroslavl OFAS. In April 2018, Yaroslavl OFAS opened a proceeding against a cartel involving two companies that allegedly colluded at 49 auctions on the supply of reagents and diagnostic preparations.²²⁹⁰ These companies implemented the bid rotation technique facilitated by auction robots set at 0.5% and 1% decrease of the starting price. Notably, in this case the companies colluded at two electronic procurement platforms (Sberbank AST and RTS-Tender) using auction robots built into these platforms.

The review of these auction robots cases shows the evolution of bid rigging in the digital age. It demonstrates that collusion in e-procurement might be facilitated by auction robots. In all cases examined the collusion was a classic “Smoke-Filled Room” bid rigging (overt collusion),²²⁹¹ as colluders entered into cartel agreement beforehand. Despite the traditional nature of the collusion, colluders used new tools – auction robots – to implement bid rigging.

However, the review shows that built-in auction robots may also facilitate the competition authority’s work, since in order to use auction robot the company must submit its settings to the e-procurement platform before the auction begins, thus creating additional evidence, which might assist the authority in proving the intent to collude. However, the use of third-party standalone auction robots (in contrast to built-in robots) does not create such evidence, since the robot runs on the colluders’ premises and its settings can be erased by colluder once the auction is finished.

Auction robots have been used in a number of jurisdictions. 18F (the office of United States General Services Administration aimed to build digital services for US Federal agencies) has experimented with enabling micro-purchase auction participants to bid via API (i.e. allowing bidders to use standalone auction robots).²²⁹² 18F noted that bidding activity in the very first auction opened to robots was much higher than in the previous auctions (7 unique participants submitted 70 bids vs. 5-7 bids submitted by 3-4 participants in previous auctions). However, the final price was higher than the price of the previous auctions. In 18F’s opinion the high final price might be explained by the

2290 Yaroslavl OFAS Order on Cartel Proceedings Initiation as of 29 March 2018, <http://solutions.fas.gov.ru/to/yaroslavlkoefufas-rossii/b-n-63c28800-094e-40f7-bc18-5424a43acaf1> (in Russian)

2291 See, for example, Ariel Ezrachi and Maurice Stucke. From Smoke-Filled Rooms to Computer Algorithms — The Evolution of Collusion, <http://clsbluesky.law.columbia.edu/2015/05/14/from-smoke-filled-rooms-to-computer-algorithms-the-evolution-of-collusion/>

2292 Michael Torres and Alan de Levie. The Role of Bot-Bidding in Micro-Purchase Auctions. 2016, <https://18f.gsa.gov/2016/08/09/the-role-of-bot-bidding-in-micro-purchase-auctions/>

change of auction type due to the robot's presence. Since most of the bids were submitted by robots (including the winning bid which was submitted just seconds before the auction end), the final price was effectively determined by robots' minimum prices which were set by the participants before the auction started. Hence, the open reverse auction collapsed to sealed bid auction. Nevertheless, 18F does not give up and aims to use the learnings from this auction to make electronic bidding platforms convenient for both manual and automatic bidding. In particular, 18F in its future experiments may push forward the auction deadline when the last seconds bid is submitted thus giving human-participants time to react to the new bid.

Whilst auction robots at the Russian e-procurement systems Sberbank-AST and RTS-Tender implement the simplest autonomous bidding strategy known as proxy bidding,²²⁹³ there exist a number of more advanced autonomous bidding strategies that might be employed by the companies in the future. For example, scholars have shown that machine learning methods can be employed to predict bids at government procurement auctions.²²⁹⁴ Such predictions can be used by companies to assess multiple auctions and take part only in the most profitable ones, thus effectively allocating business capacity. Nevertheless, the implications of such advanced techniques on competition enforcement is yet to be explored.

8.5.3. Blockchain and detection of collusion

Blockchain technology does not only set challenges to competition authorities; it also provides a lot of opportunities to assist them in their work. For instance, cartel enforcement may become more effective if DLT is used for the submission of leniency applications, but also in order to handle the sheer amount of evidence usually collected in a competition law case. Access to the file will also be more easily managed, thus, more effectively protecting the rights of defence. Competition authorities and courts may also have access to a data stream kept on blockchain with all the relevant transactions. This could be valuable information in order to provide evidence of a competition law infringement, but also in the context of actions for damages. The availability of this data will also facilitate the monitoring of markets by competition authorities and the early detection of cartels, as well as other anticompetitive activity.

8.6. Conclusion

We have reviewed the contributions indicating that the use of algorithms not only facilitates explicit agreements between firms, it can also result in tacit coordination and, moreover, facilitate tacit collusion. Analysis of the existing models of algorithmic collusion implies that it is possible for independent algorithms to coordinate and sustain

2293 Roth, Alvin E., and Axel Ockenfels. "Last-minute bidding and the rules for ending second-price auctions: Evidence from eBay and Amazon auctions on the Internet." *American economic review* 92.4 (2002): 1093-1103.

2294 J.-M. Kim and H. Jung (2018), "Predicting Bid Prices by Using Machine Learning", *Applied Economics*, http://faculty.morris.umn.edu/~jongmink/research/AE_bidding_2018.pdf

prices close to collusive level.

Both the use of algorithms to monitor and enforce existing agreements and coordination by pricing algorithms themselves not only facilitates tacit and explicit collusion but also makes it more difficult to detect the violations. Detection would become more difficult as there would be fewer opportunities to obtain hard evidence. At the same time, the range of detection tools will have to be expanded including new software screening tools and new regulatory agencies with experience in IT and AI. These agencies should have a capacity and expertise to be able to detect, document and verify the use of prohibited algorithms or algorithms that can be potentially harmful for consumer welfare. Per se prohibition of certain types of algorithms can also be an option. Also other policy instruments, such as e.g. leniency programs, will have to be redesigned.

From the legal perspective we conclude that the current antitrust concept of collusion and its emphasis on communication is not sufficient to take into account all forms of algorithmic collusion. It is probably sufficient for the situations of coordination on pricing algorithms and third-party-pricing. But it is not sufficient for the situation of autonomous tacit collusion by learning algorithms themselves.

The policy options for competition law and competition policy to deal with the increasing threat of algorithmic collusion at the moment seem to be rather limited. Algorithmic collusion could be considered as a violation of competition law only if the concept of an agreement is extended to cover also this new type of collusive behaviour. But even then, serious difficulties remain with respect to the detection as well as the verification of algorithmic collusion.

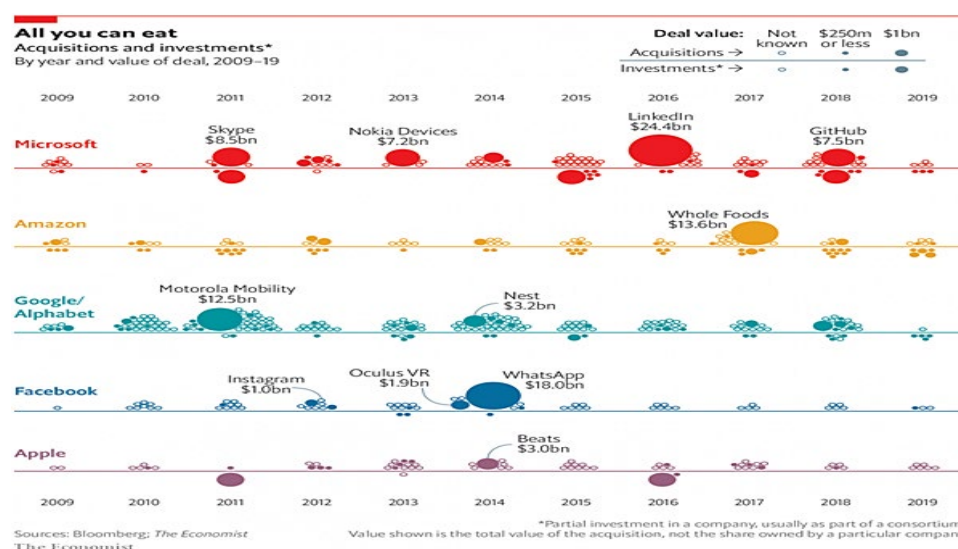

Chapter 9 : Digital Mergers : The Basics

Pierre Régibeau and Ioannis Lianos with the BRICS teams

9.1. Introduction

From Facebook acquiring WhatsApp and Instagram to Microsoft buying out LinkedIn, Skype and Github or Google swallowing Motorola Mobility, DoubleClick or Nest Labs, mergers and acquisitions in the digital economy have been controversial. Some of the concerns have been fairly traditional. For example, would the Skype transaction reinforce Microsoft's ecosystem in the business services area and lead to higher prices for corporate clients? Would Google's capture of Motorola Mobility lead to synergies and more innovation or would it lead to overly aggressive enforcement of standard essential patents? And what of the increased concentration in data ownership that some mergers appear to foster? Big Tech firms, in particular Microsoft, Amazon, Google/Alphabet and Apple have proceeded to a M&A spree and investment in potential rivals and other companies in recent years (see Figure 9.1.) Targets tend to be firms that are four-year-old or younger in nearly 60% of the cases, some recent research showing that 'the median age of Amazon's targets is 6.5 years, that of Facebook's targets is 2.5 years, and that of Google's targets is 4 years'²²⁹⁵.

Figure 9.1.: Acquisitions and investments of Big Tech

2295 Lear, Ex-post Assessment of Merger Control Decisions in Digital Markets (Final Report, May 9, 2019), available at http://www.learlab.com/wp-content/uploads/2019/06/CMA_past_digital_mergers_GOV.UK_version-1.pdf, ii.

Digital mergers have also brought new issues to light. What are, for example, the implications of some of the more common digital business models or increasingly concentrated data control for the privacy of citizens? How thorough are dominant firms likely to be in ensuring the safety of this data? Who owns the content displayed on digital platforms and who is responsible for ensuring that this content does not violate local Laws on diffamation or incitation to violence? While these “sexier” issues receive great attention in the rest of the report, they are completely ignored in this chapter.

We focus instead on a more prosaic question: does the explosion of the digital economy call for a rethink of how we review mergers or can we pretty much ignore this development and stay the course? Notice that we limit our attention to merger policy. Although the growth of digital technology also has implications for antitrust, we only broach such effects to the extent that they might affect merger control. For example, we do not dwell much on why a business’ reliance on complex algorithms might make it harder to detect and monitor anti-competitive conduct but we discuss what this implies for the standard of proof to be used when reviewing concentrations. In a similar vein, we try to limit ourselves to issues which are closely tied to digital technology. For example, much attention has been paid to the fact that many important digital platforms do not charge final customers for their services. While this “zero price” issue is interesting and has implications for the evaluation of merger effects, this is a phenomenon which arises because platforms must balance the demands and incentives of multiple constituencies. There is nothing intrinsically « digital » about the phenomenon.

We begin, by reviewing the basic principles of merger controls, distinguishing between the economic mechanisms through which mergers can lead to consumer harm and between the aspect of the firms’ behaviour that the transaction might adversely affect. In the following section we define more precisely what we mean by ‘digital’ and identify the specific features of the ‘digital world’ which are most relevant to the process of merger review. Then we provide a quick review of the main merger cases in the digital economy. The following Sections systematically analyse how the main features of digital technology might or might not require material changes in the manner in which Competition Authorities assess proposed concentrations in digital sectors. We begin with market definition and then review the main economic mechanisms and the aspects of the firms’ behaviour discussed. The final Section concludes.

9.2. The Basic Principles of Merger Control

Merger control regimes generally rely on a system of *notification*, where the merging parties must inform the relevant competition authorities of impending transactions if that transaction fulfills a number of criteria linked to the overall “size” of the transaction and its territorial footprint. As a result, mergers involving companies which are small compared to the sectors in which they operate are off the radar.

The vast majority of notified mergers are waved through with only the most cursory review, mostly on the basis of a lack of significant overlap between the merging parties

in terms of products and territories served. From a total of 7,289 merger transactions notified to the Commission between 1990 and 2019, only 29 of them were blocked following a Phase II assessment.²²⁹⁶ This represents less than 0.4% of notified cases.

There are broadly four types of mechanisms through which a merger could harm consumers. Each of these mechanisms can also apply to different aspects of the firms' behaviour, mostly price/output decisions and quality/innovation investments. Let us start with price or output choices.

Before we proceed, though, a warning is in order. The authors have no specialised knowledge of digital technology. While we have made a point of informing ourselves and have learned through our involvement in a number of "digital" cases, we cannot be certain that our assessment of the technology is always perfectly accurate. This in itself contains one an important policy conclusion if Competition Authorities are to monitor the new digital economy – including mergers – effectively they need to endow themselves with the necessary in-house technological expertise. Unfortunately, most competition authorities, including many of the leading ones, do not yet have access to such resources.

9.2.1. Horizontal Overlap and Unilateral Effects

In the absence of efficiencies, any merger between parties selling products which are substitutes and are sold in the same geographic area puts upward pressure on the prices charged by the parties. The rationale for this pervasive effect is now well known. When firm A and firm B are independent, A faces a simple trade-off: setting a higher price means fewer buyers but it also means a higher profit margin on each sale. The profit-maximising price is the price which balances these two effects at the margin. After A and B have merged, some of the sales lost if the price of product A is increased are recovered by product B. Hence, for the merged entity as a whole increasing the price of product A is more attractive than before the merger. The larger the proportion of sales lost by A which is recovered by B, i.e. the larger the *diversion ratio* between A and B the more the merger is likely to lead to a substantial increase in the price of product A. As diversion ratios are larger when the two products are closer substitutes in the eyes of consumers, mergers between firms producing substitutable products are of particular concern.

Anticipating a notable characteristic of the digital sector, the description of the horizontal overlap that we have just given depends on the assumption that a firm sets a uniform posted price for its product(s): every customer pays the same known unit price, irrespective of the number of units purchased. This is why setting a lower price involves a trade-off: the firm gets more sales but has to accept a lower profit margin on the sales that it would have made at a higher price. Once the firm is able to set charge different prices to different groups of customers, this traditional trade-off, which is the basis for our usual notion of "market power", is weakened. Indeed, in the extreme case where a

²²⁹⁶ See <http://ec.europa.eu/competition/mergers/statistics.pdf>.

firm is able to charge different prices (and conditions) for each sale to each individual, this trade-off breaks down completely and there is no market power in the traditional sense of the term.

Does this mean that “market power” is not an issue when market mechanisms other than “uniform posted prices” rule the market? Definitely not. Market power, understood as a supra-competitive margin over costs can emerge under almost all kinds of price-setting mechanisms. Moreover, and this is ultimately what we care about, the vast majority of market mechanisms allow rival firms to put competitive pressure on each other so that the removal of one such rival through merger still leads to upward pressure on prices and hence larger profit-margins and potentially poorer outcomes for consumers. For example, in “auction markets”, where rivals bid for the right to fill a pre-specified order, there is no direct link between the bids that a firm submits to different potential clients, but the level of the bids for each transaction is still constrained by the firm’s desire to undercut rival bidders²²⁹⁷. Similarly in a bargaining context, where each bilateral agreement is as individualised as the parties want it to be, competition from rivals – and thus the profit margins accruing to the seller, work through both “disagreement pay-offs” (what the parties if they keep disagreeing) and outside options (the best pay-off a party can get if it decides to walk away from the negotiations).

In order to assess the magnitude of horizontal overlap concerns, Competition Authorities typically look first at market shares and measures of upward pressure on prices (UPP) augmented by qualitative evidence. In the EU at least, the use of more involved models of industry behaviour, calibrated or estimated, is the exception, not the rule. UPP measures, such as GUPPI or IPR, are particularly well suited to obtain a quick estimate of the likely increase in prices²²⁹⁸ that would result from the internalisation of sales diversion between the merging parties when the parties compete in prices and the merger keeps the total number of products that they offer unchanged. While one can devise measures of UPP for quantity competition, auction markets or even bargaining, they are typically harder to apply as they involve « diversion ratios » which are harder to estimate in practice than those needed for the « price » UPP.

Measures of UPP do not allow us to compare a pre-merger equilibrium to a post-merger equilibrium. This is because measures of UPP only look at the incentives of the merging parties without considering the reaction of rivals. These reactions include both unilateral reactions within the confines of a price or quantity-setting oligopoly and potential entry. Potential entry can cut either ways. On the one hand, the existence of companies with the ability and desire to enter if the merger reduces the intensity of competition sufficiently means that measures of UPP would tend to exaggerate the harmful effects of the merger. On the other hand, the disciplining role of potential entry also means that a merger between two firms who do not currently offer overlapping product can

2297 Indeed, as Klemperer (2000) has shown (Klemperer, P, 2000, “Why Every Economist Should Learn Some Auction Theory”, SSRN Working Paper 241350. there is a formal equivalence between some auction models and models of posted price competition. Also see Bülow, J. and P. Klemperer, 1994, “Auctions Versus Negotiation” NBER Working Paper 4608.

2298 To be precise, we can only go from a measure of UPP to an estimate of likely price increases by making some assumption on the shape of the demand functions faced by the firms.

still raise concerns if one or both partners are seen as likely potential entrants into each others' markets.

Typical remedies when the transaction involves significant horizontal « overlap » are divestment of products and/or productive capacity.

9.2.2. Facilitation of Coordinated Effects

Merger review is a forward-looking exercise. It is therefore legitimate to ask whether the proposed concentration might affect the very nature of competition between the merged entity and rivals. In particular, it is prudent to consider whether the transaction might not make it easier for firms to coordinate (tacitly or not) their pricing/capacity/production decisions, reducing the intensity of competition and ensuring greater profit margins. The firms' ability and incentives to coordinate their actions depend on the possibility of identifying mutually agreed objectives, the ease with which the compliance of the firms with the agreement can be monitored and the parties' ability to discipline any firm straying from the agreed plan of action.

Typically, merger review focusses on three main factors, which are susceptible to facilitate coordination: market transparency, the number of independent firms in the market and the degree of symmetry between these firms. Market transparency is crucial to monitoring. A larger number of firms complicates monitoring and increases the unilateral incentives to deviate from the agreement. Finding a mutually profitable course of action is easier if all firms sell similar products, have similar goals and are of similar size. Greater symmetry also tends to decrease individual incentives to deviate from the agreement.

9.2.3. Facilitation of Abuse of Dominance

In a world where competition authorities have complete information about the behaviour of large companies and where antitrust enforcement is cheap, there would be no reason to consider potential abuses of dominance as actual abuses could be easily dealt with post-merger. However, if the merger is likely to create or enhance a dominant position and abuses of dominant position are difficult to detect and prove, then there is a rationale for blocking the merger even if the traditional effects of the transaction on prices could be remedied. Consider for example two merging companies A and B. Those companies both compete in a downstream market and supply an important input for firms operating in that market. A merger between A and B is therefore likely to increase their incentives and ability to foreclose (partially or completely) other downstream rivals. While one could simply wait and only intervene if the merged entity does pursue such strategies, competition authorities often use the merger review process to impose remedies aimed at preventing such abuses post-merger.

9.2.4. Innovation/Quality

Over the last few years, Competition Authorities have paid increasing attention to how mergers might affect innovation in the relevant markets.²²⁹⁹ The current view seems to be that, absent innovation-specific efficiencies, mergers between parties with overlapping product lines are just as likely to be harmful in innovation-intensive industries than in sectors with less innovation. However, there are two additional issues to consider. Firstly, the range of potential merger-specific innovations to consider is broader than for a traditional, static merger analysis. Not are there potential economies of scale in the conduct of R&D activities but one must also examine the effect of the merger on the diffusion of innovation, the internalisation of spillovers or the resolution of IPR disputes. Secondly, in the presence of significant innovation, mergers can be harmful even if there is no clear overlap between the product lines of the two parties. Such « innovation theories of harm » rely instead on similarities in the merging parties' *ability to innovate in similar scientific areas*. The companies' research "profiles" must therefore also be examined without direct reference to the relevant product markets where the two firms are active.

9.2.5. Efficiencies

Merger-specific efficiencies are decreases in costs and/or improvements in product quality, which are unlikely to occur without the merger. In most jurisdictions, efficiencies are only relevant if they are passed on to consumers. This requirement is automatically satisfied for quality changes but for cost-reducing innovation both the nature of the innovation and the degree of cost pass-through (itself a consequence of the shape of the demand function and the nature of competition) matter. In practice, *expected* changes in product quality are particularly difficult to assess so that competition authorities often focus on the cost side, giving particular attention to changes in variable costs. As we saw above, another set of possible efficiencies needs to be considered when the sector is characterised by significant innovation.

9.3. What does 'Digital' Mean and What does this Imply?

As the name indicates, "digital" relates to anything that relies on numerical coding. This includes all kinds of software and communication of information expressed numerically. Over the course of the last three decades, our technological ability to both process and transmit digital information has increased exponentially. Moore's Law predicts that the number of transistors in a dense integrated circuit doubles about every two years,

2299 On this topic see Federico, G., 2017, « Horizontal Mergers, Innovation and the Competitive Process », *Journal of European Competition Law and Practice*, 8 :10, pp. 668 – 677; Federico, G., G. Langus and T. Valletti, 2017, « A Simple Model of Mergers and Innovation », *Economics Letters*, 157, pp. 136 – 140; Motta, M. and E. Tarantino, 2017, « The Effect of Horizontal Mergers, When Firms Compete in Prices and Investments », Working Paper 17-01, Mannheim University; P. Régibeau & C. Rockett, *Mergers and Innovation*, (2019) 64(1) *Antitrust Bulletin* 31.

showing the rapid increase of computing power over the last few decades. Metcalfe's Law predicts that the value of a telecommunications network is proportional to the square of the number of connected users of the system, thus indicating the important network effects in the digital economy²³⁰⁰. This improved technological ability explains the rapid growth of what we refer to as the "digital sector", while the presence of network effects may explain the concentration observed in the various sectors of the digital economy.

A first salient feature of digital technology is that, for some types of transactions it makes it possible to span long distances at very low cost. This clearly has implications for defining the set of rivals likely to impose a competitive constraint on the merged entity, but it also matters when gauging the likelihood of post-merger coordinated effects. Moreover, when the distance-erasing quality of digital technology makes it possible to deliver the product or the service itself equally readily in many regions or countries, it also lead to an acceleration of industry dynamics. Companies which would otherwise have started on a regional basis before venturing further afield can now be present globally in the matter of a few years, if not months. This means that first mover advantages (e.g. Facebook's network effect) can balloon quickly into a dominance, which is difficult to challenge. The market may easily tipp. In this context, merger policy might want to pay especially close attention to market dynamics and thoroughly scrutinise the acquisition of potential rivals who might challenge such doinance, even if these transaction fall below the traditional thresholds for in-depth inquiry or even for notification.

The second important feature of digital technology is its reliance on algorithms. This has three main consequences. Firstly, algorithms tend to be complex and, as such, they are not very transparent to the non-expert, including Competition Authorities. This makes it harder to assess possibly abusive conducts, which might be facilitated by a merger, but also makes it more difficult to impose remedies which can be monitored effectively. Secondly, algorithms might be (ab)used in order to facilitate coordination between otherwise independent parties, which has implication for evaluating the likely coordinated effects of a merger. Finally, algorithms are data-hungry, for three main reasons : algorithms are good at handling large amounts of data, making data-intensive products and services more attractive ; one needs data to test and refine algorithm and, in the domain of artificial intelligence, data is essential both for the initial « training » of the algorithm and for its continued learning-based development. This naturally leads us to the third feature of digital tehcnology: data, in particular data from different sources that enable the data holders to make better predictions.

There is a close interactive relationship between the development of digital technologies and the increased competitive importance of data. Clearly data is only worth having if it can be used effectively to increase the firm's performance. This requires the ability to *process* data in a meaningful manner. This is where Moore's law matters. But, of course, processing capacity is only useful if sufficient data can be obtained, stored and easily

2300 See Baldwin, R.E., 2019, *The Globotics Upheaval*, Weidenfeld and Nicolson and Oxford University Press, for further analysis of the implications of these laws.

accessed...which itself is getting easier due to various digital technologies such as scanning, cookies, drastic drops in the price of digital storage and the “distance spanning” ability of digital technology which ensures that massive centralised databanks can be plugged into from anywhere on the planet. The implications of this tend for competition policy in general, and merger control in particular are quite varied and fundamental.

Most obviously, the increased importance of data raises the issue of who owns that data. If data become a main source of competitive advantage, then it becomes necessary to prevent rivals from accessing the data to make the competitive advantage sustainable. So the race is on to establish property rights or possession on information which was previously ignored and/or in the public domain. As data become valuable assets, it is natural to ask whether a proposed merger is likely to lead to an undesirable increase in data ownership. In turn, this leads us to contemplate how we should define “data-markets”. This might be a relatively simple task for narrowly “specialised” data (say data on vehicle emissions) but is far less obvious when a given data set (e.g. on consumers’ characteristics and behaviour) can potentially be used for many different purposes. A further complication comes from the fact that, depending on the type of property rights used to protect data, these rights might be national in scope even though, creating a tension between IPRs and the “distance spanning” feature of digital technology.

In order to properly conduct merger reviews in sectors where data are a crucial asset, we also need to better understand the basic economic characteristics of that asset. How large are economies of scale? How fast does data depreciate? What is data actually used for? Are there important synergies between data and some other assets like other IPRs or human capital? Unfortunately we are far from knowing all of the answers to these questions.

Finally, the abundance of usable data does not just affect the nature of the goods and services that can be sold and where they can be sold, it also affects *how* these products can be sold. In particular, an abundance of readily processable data on consumer preferences and behaviour make it possible to move from a business model where most customers faced the same offers to one where both the products made available and their price are tailored to a narrow group of consumers or even to each individual buyer. While we will not discuss the broader welfare consequences of this new marketing model, we must at least consider how the new pricing strategies affect the intensity and nature of competition between rivals. Crucially, does a switch to individualised pricing change our usual presumption that a merger between close rivals put upward pressure on prices and why?

It is also worth noting the “features” that we do *not* see as typical characteristics of the digital sectors. In particular we do not believe that either network effects or “multi-sid- edness” are essential characteristics of the digital world : they are found in a wide variety of non-digital businesses and are absent in a number of digital sectors. Accordingly, we ignore issues which have been a staple of the current debate on digital platforms/ag- gregators, such as “winner takes most” and the juggling of multiple constituencies. Such

issues are clearly important for the assessment of mergers in a number of digital sectors but they are not specific to the digital world.

While “digital” is a convenient headline, the sector includes a great variety of products, both goods and services. It will be useful to group these products into a few broad categories.

This first broad group are “telecom products”. The main function of these products, be it phone, mobile infrastructure or cable is to connect customers. Not surprisingly, these products draw mostly on the increased ability to send information (e.g. voice, data) quickly over significant distances made possible by digitalisation. Because communication requires compatibility between the products used by different consumers, telecom products can only flourish in the presence of widely accepted interoperability standards. If interoperability is less than perfect, then telecom products are also characterised by network effects. It is useful to draw a further distinction within this group between voice communication on one side and data communication and social networks on the other side, as voice communication has not (yet ?) been affected much by the digital revolution. The inclusion of social networks within the “telecom” group might surprise, but we believe that it makes sense since the ultimate function of these networks is to enable various types of internet-based communication between its users.

Our second group is made of “digital sales channels or digital sales platforms”, where customers place their orders remotely through the internet. We further distinguish between the sale of goods or services that can also be *delivered* in numerical format and those that require physical or even face to face delivery. So, for example, music, books, films or photographs can not only be ordered on the internet, they can also be delivered through the same route. This is also true of some services like computer trouble-shooting, banking services or power-point presentation services. By contrast, goods such as food, clothing, tools or furniture require physical delivery. Similarly, a large number of services, like massage, surgery or child minding still rely on the joint physical presence of customers and providers.

In our third group, we include “intermediaries”, i.e. platforms which allow different parties to transact with each other, usually in exchange for a fee. Examples include platforms facilitating commercial transactions, such as Amazon Marketplace and “matching” platforms such as dating sites.

Given its central role in linking the internet-based economy, we consider internet search (fixed or mobile) as a fourth category by itself.

Our fifth group includes “robotics” broadly construed as any technology which allows tasks to be performed with no or minimal human intervention. These products are increasingly controlled remotely and are called to work with an increasing number of complementary products and services. As such, they are directly affected by the distance-reducing feature of digital technology and their performance depends on interoperability. A subgroup of special importance comprises goods and services relying not just on automation but also on artificial intelligence. AI products are characterised by

a large need for data not only as “processing food” but as a necessary part of their creation and continuous development. Moreover, AI can also be used to set important elements of a firm’s strategy, such as pricing, with minimal human input so that our current understanding of these strategies and how they might be affected by a merger might need to be reviewed.

Finally we define a sixth group including the products which are not mostly used for communication or sales but rely themselves on digital technology. This category goes from digital clocks to computers to cars.

In Table 9.1., we combine these six categories with the three most salient features of digital technologies to try to grasp whether the impact of digitalisation is likely to be similar across different types of products and services or whether the importance of the merger’s “digital” dimension varies significantly depending on the type of products involved. The number of crosses in each cell indicates the importance of corresponding digital feature in the corresponding product group.

Table 9.1 : Importance of Digital Technology for Various Groups of Digital Products

	Telecom		Sales Channels / Platforms		Matching/ Intermediation Platforms	Robo- tics	Search
	Voice	Data	Digital goods, remote services	Physical goods, face to face services			
Spans distances		XXX	XXX	X	X/XXX	X	XXX
Data Intensive		XX	XX	XX	XX	XX	XX
Crucial Role of Complex AI-Algorithm			X	XX	XX	XXX	XXX

That digital technology does not affect competition across all types of “digital” activities in a similar manner should already be clear from the fact that the continuing success of the “big four”. Google, Facebook, Amazon and Microsoft each relies on a very different source of competitive advantage : an outstanding search algorithm compounded by data accumulation for Google, first-mover advantage with network effect for Facebook, logistics prowess and scale for Amazon, a core competency in programming/algorithms and a strong position in office products for Microsoft.

Let us go quickly through this table, row by row. The distance-reducing aspect of digitalisation is of little importance for traditional voice communication, where global reach was achieved without advanced digitalisation²³⁰¹ but it is important for the communication of data as well as for the supply of advanced services such as teleconferencing -including its « virtual presence » version- and social networks. The abolition of distance is

²³⁰¹ Of course facilitated by digital switches.

of course essential to search as well as to digital sales platforms, especially those which can also deliver the products for sale digitally. For “intermediaries”, the relevance of distance actually depends on the nature of the service provided : for Amazon Marketplace, the role of distance is the same as for sales platforms, but dating platforms, for example, are inevitably more local. Finally, robotics can benefit from the elimination of distance through two main channels: the ability for centralised remote control and the access to the amount of data and raw “experience” required to get peak performance from artificial intelligence.

Internet sales, social networks, search and robotics are all data-intensive although, as we will discuss below, they rely on somewhat different types of data with different consequences for merger review and remedies.

Finally, the most sophisticated algorithms are found in search, robotics (especially AI) and, to a lesser and varying extent, intermediation platforms. Three main types of algorithms are involved in internet-based sale : algorithms that help tailor customised offers, algorithms to match specific add displays to specific customers in order to maximise “clicks” and, when physical delivery is required, algorithms that handle the inventory and dispatch of the products.

9.4. Main ‘Digital’ Merger Cases: a panorama of the legal issues

We will explore the following issues: market definition, theories of harm and the challenges of employing a more dynamic assessment of mergers for the definition of the counterfactual, standard of proof and burden of proof.

9.4.1. Market definition

Data may play different roles in the digital economy. It may constitute the output of the production process, for instance, supermarket scanner data may be sold as such on the market. It can also be an important input for the production of another product, in which case the accumulation of data by one firm may prevent competitors from accessing a sufficient minimum scale of data, thus affecting the competitive structure and eventually also causing consumer harm. Data as an input may certainly affect the cost of the product, but the use of data may also constitute an element of the quality of a product, to the extent that data protection laws may mandate that the use of data in particular if these are personal data, should be minimised to what is adequate, relevant and limited to what is necessary in relation to the purposes for which they are processed, with the aim to protect privacy²³⁰². In view of the dynamic nature of digital competition, and the complexity of the technologies involved, competition authorities have taken a relatively flexible approach concerning market definition, occasionally not reaching a final conclusion as to the exact scope of the relevant market(s) affected by the merger.

2302 See, for instance, Article 5(1)c GDPR.

We will first explore the approach followed in more mature jurisdictions, in particular the EU and the US, before focusing on the way BRICS countries have assessed market definition in cases involving data or more broadly the digital sector.

9.4.1.1. The EU/US practice on market definition for digital mergers

Two-sided markets: The two-sided dimension of the various platforms involved has been taken into account, although not usually at the level of market definition, where competition authorities have usually assessed each side of the platform as constituting distinct relevant markets²³⁰³. For instance, in *Facebook/WhatsApp*, the Commission identified separate markets on each side of the platform, analysing differently markets relating to users from the social network provider's online advertising activity²³⁰⁴.

Hardware/Software Platform and Applications: Competition authorities when defining the relevant market have also kept the distinction between the hardware, the software platform/operating system and the applications/services layers. In *Microsoft/LinkedIn* the European Commission distinguished between the market in PC operating systems (OS) (excluding from the market OS for other devices in view of a lack of demand-side substitutability)²³⁰⁵, and the applications markets. The Commission analysed the following applications markets: (i) productivity software for PCs (in order to enable users to create documents, databases, graphs, worksheets etc.), (ii) the market for customer relationship management software solutions, which was further segmented on the basis of functionality in sub-markets or on the basis of the type of service (cloud or on premises), (iii) the market for sales intelligence solutions (providing sales professionals with background and contact information about individuals), (iv) the market for consumer communication services, (v) the market for professional social networks, (vi) the market for online recruitment services, and (vii) the market for online advertising services (search and non-search). In *Apple/Shazam*, the Commission distinguished between the markets for devices where Apple was active, the market for operating systems, perceived as platforms for software solutions and/or apps, and various software solutions markets, such as the market in digital music distribution services (without finding it necessary for the specific case to distinguish between streaming providers and music downloading services providers) or the market for automatic content recognition software, including music recognition apps²³⁰⁶.

Consumer communication services markets (involving multimedia communications solutions that allow people to reach out to their friends, family members and other contacts in real time) were considered, in a number of decisions of the European Commission, as forming a different product market than enterprise communications ser-

2303 See, for instance, OFT, *Facebook/Instagram* (2012).

2304 See, *Facebook/WhatsApp*

2305 This in line with Case C-3/37.792 – *Microsoft*; Case M.6381 – *Google/Motorola Mobility* (2012); Case M.7047 – *Microsoft/Nokia* (2014).

2306 Case M.8788 *Apple/Shazam* (2018)

vices²³⁰⁷, in view of the more sophisticated services and additional features offered, such as collaborating tools, integrated voicemail, simultaneous ringing etc²³⁰⁸. In *Facebook/WhatsApp* the Commission further explored if the market should be sub-divided by distinguishing between consumer communication services by breadth of services offered as a standalone app (e.g. WhatsApp, Viber, Skype) or those offered as part of a broader offering such as a social network (e.g. Facebook, LinkedIn). It however rejected the further sub-division by functionality (whether this involved all forms of communication, e.g. photo, text, video, or if this is offered one-to-one and/or group real-time), noting that these services compete on the same market for the same consumers. For similar purposes, it also refused to sub-divide the market by operating system (e.g. proprietary app, such as iMessage on iOS or cross-platform app, such as WhatsApp), as it observed that consumer communications apps available for different operating systems are normally regarded as a single product by users (demand-side) and providers (supply-side). Finally, the Commission considered the segmentation by platform (smartphones, tablets and PCs) most relevant as at the time of the merger WhatsApp was offered only for smartphones and it did not have any plan to expand its offering to other platforms, concluding that the relevant product market included only consumer communications apps for smartphones²³⁰⁹. In *Facebook/WhatsApp* the Commission also explored if the relevant product market should be broadened to include traditional electronic communications like voice calls, SMS or MMS, finding some degree of (imperfect) demand-side substitutability, in view of the fact that these services are used for the same general purpose. However, finding one relevant market was ultimately rejected, in view of the different structure of the market and the competitive constraints, which are only exerted in one direction (as electronic communication services do not constrain consumer communication services), and differences in the pricing models for these services. The geographic dimension of these markets was EEA-wide although the Commission did not exclude the possibility of defining geographic markets at the Member State level, because of differences in the penetration of parties' apps from one Member State to the other, barriers to entry and differences in customer switching, although it concluded that this was not here the case.

Social networks form part of a separate market for social networking services. The Commission examined their substitutability with consumer communication services in *Facebook/WhatsApp*, where it considered that they formed two separate relevant product markets, in particular as the functionalities of social networking services are richer than those provided by consumer communication services. Indeed, social networks tend to enable communication and information sharing with a wider audience (all the contacts of a user unless restricted), whereas consumer communications apps mostly enable one-to-one communication. However, it also noted that the lines between the

2307 See also, Case M.7217 Facebook/WhatsApp (2014), Case M.7047 Microsoft/Nokia (2014), Case M.6281 Microsoft/Skype (2011).

2308 See, Case M.8124 Microsoft/LinkedIn (2017), para. 78.

2309 Note, however, that presently there is a WhatsApp desktop function, although it only operates when connected to the phone through the scanning of a QR code.

two product markets become increasingly blurred. The Commission left open the question whether the social network market should be further subdivided according to the platform (e.g. PC, smartphone, tablet) and the operating system (e.g. Windows, Mac, Android or iOS), as well as with regard to its intended use. In *Facebook/WhatsApp* the geographic dimension of the market was EEA-wide, although the Commission also found indications that the geographic scope for social networking services could be defined as global. The issue was also revisited in the recent Bundeskartellamt decision on Facebook²³¹⁰. Facebook submitted a White Paper on “Relevant Markets and Lack of Dominance” stating that the relevant market for the product concerned was a ‘market for attention’ on which countless competitors competed for the attention of users on the Internet in addition to Facebook. This would at least include the competitors Instagram, YouTube, Google+, Twitter, Snapchat, Pinterest, LinkedIn, Xing and StudiVZ and would be defined as a global market. The Bundeskartellamt nonetheless rejected this theory and concluded that the relevant market was national in view of the specific characteristics of the use of Facebook in Germany (e.g. language etc.)²³¹¹.

Professional networking services form also separate markets than consumer communication apps. The Commission further noted in *Facebook/WhatsApp* that they should not be segmented according to a platform (tablet, PC, smartphone) or an operating system, although it accepted that they should be segmented according to intended use (e.g. social networks promoting interpersonal contact and services used for professional purposes)²³¹². In arriving to this conclusion, the Commission acknowledged that, from the demand side, there are differences in the type of content people expect on these different types of networks (e.g. professional social networks usually include career related information, while personal social networks information on personal interests, friends and family), while from the supply side, substitutability is also limited as it is highly unlikely that a personal social network may develop to become substitutable to a professional one in the short term and without significant investments. The Commission also excluded from the market of (public) professional social networks closed enterprise social networks, as well as vertical professional social networks focusing on certain categories of professionals and accommodating these distinct functions (e.g. the network Academia for academics or Behance for artists), which were not found substitutable to generic professional social networks²³¹³.

Of particular interest is the definition of the geographic dimension of the market for professional social networks as national by the Commission in *Microsoft/LinkedIn*. This was based on the differences in terms of language, functionalities, legal/regulatory requirements and customers’ preferences among EEA countries and due to the fact that professional relations and employment tend to have a more local dimension and use. The Commission also noted that most PSNs active in the EEA appear to focus on a sub-

2310 Bundeskartellamt, Facebook decision (2019), https://www.bundeskartellamt.de/SharedDocs/Entscheidung/EN/Entscheidungen/Missbrauchsaufsicht/2019/B6-22-16.pdf?__blob=publicationFile&v=5.

2313 Case M.8124 Microsoft/LinkedIn (2017), para. 109.

set of EEA countries, without having an EEA-wide presence (with the exception of LinkedIn) and pointed to the difficulties for company already offering a PSN in one country to successfully start or expand this in another country without significant investments time and resources²³¹⁴.

Online recruitment services: Occasionally similar services are offered online and offline, thus raising the issue of the distinction between the specific activities in separate relevant markets. The issue was raised in *Microsoft/LinkedIn* with regard to the need to distinguish between the market for offline recruitment services and the market for *online recruitment services*. The Commission observed that jobseekers regarded online and offline services rather as complimentary than substitutable and highlighted that online job advertising becomes increasingly more important than offline job advertising. The Commission noted differences in features such as the fact that online recruitment services allow faster and more comprehensive access to information, or that online services are an impersonal “behind a computer” only experience, whereas offline services consist of a personal contact and relationship (as regards career advice etc.), the superiority of online job ads in terms of efficiency, scope, speed and accessibility etc. Recruiters/employers also agreed that while online recruiting services ‘give the flexibility to announce open positions to a *wider audience*, offline recruitment services focus more on the specific range of people who are suitable to a role, and include face to face interviews, personal interaction and more in-deep analysis of a candidate’s qualification’²³¹⁵. The Commission also examined but left open the question of the further segmentation of the online recruitment services depending on the business model or the relevant industry sector, noting nevertheless that different industry sectors may utilize different channels of recruiting and methods of selection, different customer expectations, different education and experience level, and the level of technicality of the industry and that the nature of the industry and the types of job may even require a different route for recruiting. For instance, lower skilled positions can be filled by means of job advertising, whereas more specialist and skilled roles may require a more proactive approach and reliance on professional recruitment. Finally, the Commission noted that jobseekers did not perceive non-professional social network as an online recruitment tool, while professional social network websites are substitutable to those of an online recruitment tool.²³¹⁶

Online advertising markets: Similar questions have also arisen with regard to the definition of *advertising services market*, in particular for advertising-based platforms. Of particular interest is the US *Google/DoubleClick* case, where the FTC examined the competitive interactions between search engines and publishers with regard to advertising space finding that there is no competition between them²³¹⁷. The FTC explored different types of advertising. In the display advertising market, a distinction was made between premium and non-premium advertisements. Premium ads appear at the top of web-

2314 Case M.8124 Microsoft/LinkedIn (2017), paras 121-125.

2315 Case M.8124 Microsoft/LinkedIn (2017), para. 141.

2316 Case M.8124 Microsoft/LinkedIn (2017), paras 144 to 147.

2317 Statement of the FTC Concerning Google/DoubleClick, FTC File No. 071-0170.

sites, and publishers' direct sales forces sell precise spaces. For non-premium ads, ad intermediation firms indirectly purchase them. Furthermore, premium ads cost several times more than non-premium ads, and websites lack control over where ad intermediation firms place ads. Contextual advertising represents another form. Technology scans the text of web-pages for key words and delivers text ads to pages that consumers are viewing. Advertisers generally do not consider that contextual ads substitute for display ads directly purchased. Both search and contextual ads seek a direct response from consumers. The cost-per-click payment model reveals this objective. By contrast, advertisers utilize directly-purchased display ads for brand advertising. Websites or intermediaries are charged based on the number of times they display the ad. In terms of operating in the same market, the FTC acknowledged that display ads do constrain the price and quality of contextual ads, both sets of ads operating in the same market of ads sold by intermediaries.

In the EU, the Commission distinguished in various cases between the provision of online and offline advertising space, leaving it open if the online advertising could be sub-segmented into search and non-search advertising²³¹⁸. In *Microsoft/LinkedIn* the European Commission examined the substitutability between non-search and search advertising services. LinkedIn only offered non-search advertising services, while Microsoft was present in both non-search and search advertising services. The distinction refers to the targeting dimension of advertising. Targeting in search advertising is based on the exact intent of the user that it revealed by entering the search query²³¹⁹, while for non-search advertising it is based on more general criteria, such as the content of the visited website and the geographical location of the user. Non-search ads may appear on any webpage and can be either contextual (selected according to the content of the page on which they appear) or non-contextual²³²⁰. The Commission left the question open, as well as that of the possible further segmentation of the market, for instance for advertising on social network websites or by device platform. According to the Commission, the geographic dimension of the online advertising market, and its possible sub-segments, is national in scope or alongside linguistic borders within the EEA. In *Facebook/WhatsApp* the Commission again left open the question of whether the market for online advertising could be sub-segmented into search and non-search advertising. It noted the the majority of advertisers held that non-search ads are not substitutable as they serve different purposes: while search ads mainly generate direct user traffic to the merchant's website, non-search ads mainly build brand awareness. The Commission applied the traditional SSNIP test and found that most advertisers would not be likely to switch from one type to another in the event of a 5-10% price increase.²³²¹ With regard to the definition of a separate market for advertising on social network websites, the Com

2318 See, Case M.5727 *Microsoft/Yahoo! Search services* (2010), Case M.4731 *Google/DoubleClick*, Case M.7217 *Facebook/WhatsApp* (2014).

2320 For an analysis, see I. Graef, 'EU Competition Law, Data Protection and Online Platforms – Data as Essential Facility', Section 4.2.3.

2321 Case M.7217 *Facebook/WhatsApp* (2014), para. 76.

mission noted that these are usually considered more effective than other online non-search advertising due to the highly engaged audience in social networks and targeting opportunities, but nevertheless did not provide a definite answer on this issue.²³²² Regarding a possible distinction between online advertising on different platforms (PCs vs mobile devices) the Commission was more positive, although it left the issue open.²³²³ The Commission again adopted its previous practice regarding the geographic dimension of advertising noting that it can be divided alongside national or linguistic borders within the EEA, although it also mentioned the view of some respondents that, depending on the type of campaign, global companies may also procure advertising space on a broader geographic scale (EEA-wide or even worldwide).²³²⁴

Licensing data markets: In *Apple/Shazam* the Commission investigated the degree of substitutability between the merging parties' data, notably their music data charts from the demand-side, finding the existence of a new *market for licensing music data*, that is data that is actually commercialised, although it did not define a separate market for the data itself.²³²⁵

9.4.1.2. A BRICS perspective

Starting with **Brazil**, CADE will review any merger related to digital platforms markets that meets the legal thresholds (turnover requirements), having authority to approve (with or without restrictions) or block specific mergers. According to the research conducted by the Brazilian team, there were 218 merger cases related to digital economy between 2004 and 2018. The vast majority of the cases were evaluated under the fast-track proceeding, as in any other economic segment, when there were no *prima facie* vertical or horizontal concentration due to the merger. Therefore, those cases were not subject to an in-depth analysis of the relevant markets in the digital economy. Nonetheless, there are some cases worth mentioning.

For example, in *2018MNaspers*²³²⁶ the Authority had to deal with platforms of online food delivery. In order to do so, the General-Superintendence conducted a thorough analysis to better understand the functioning of two-sided platforms and the dynamics of the food delivery marketplace (e.g. it considered offline ordering through phone calls outside the market definition). Also, in the merger between Itaú and XP Investimentos,²³²⁷ involving the largest online open platform for investments, CADE also took into consideration matters regarding two-sided platforms and the dynamics of competition in each different side (i.e. offer of investment products by multiple financial institutions and demand by multiple users). The Itaú/XP case was responsible for shifting CADE's understanding on the investment market, considering two separate relevant markets in

2322 Ibid., para. 77.

2323 Ibid., para. 78.

2324 Ibid., paras 81-82.

2325 Case M.8788 Apple/Shazam (2018), paras 122-124.

2326 Merger n. 08700.007262/2017-76.

2327 Merger n. 08700.004431/2017-16.

the investment business – the “offer” of investment products and the “distribution” of such products by the open platforms for investments and necessarily by the financial institutions themselves.

The Brazilian Authority has its own Guidelines for the Analysis of Horizontal Mergers, originally published in 2001 and later revised in July 2016.²³²⁸ In the chapter regarding the market definition, the Guide lists many elements that play a role in the process of defining the relevant market in both the product and geographical dimensions. CADE usually employs the SSNIP Test to define the limits of the market under analysis. The Hypothetical Monopolist Test is also a tool usually used by the authority to set the boundaries of relevant markets. The Guidelines refer to specificities of technology markets (without providing details in how to adjust market definition in these cases) and recognise that traditional methods of analysis may not capture the anticompetitive effects of transactions in research and development markets²³²⁹.

In **China**, there are only few merger cases concerns digital markets. Some of them are dealt with under simplified procedure where the decisions available are often very short to the extent that market definition is only briefly mentioned. For example, in *2019MShenzhou UCAR* in the individual fiches we provided,²³³⁰ the competition authority only briefly mentioned relevant markets, while in other cases such as *2016MWal-Mart*²³³¹ and *2019MMobileeye Vision*,²³³² market definition is not clearly indicated.

The approach to define relevant markets is articulated in the *Guide of the Anti-Monopoly Committee of the State Council for the Definition of the Relevant Market*. It provides that the scope of relevant markets is predominantly determined by substitution from both demand and supply perspectives. The Hypothetical Monopolist Test can be used as a useful tool. Market definition is much more discussed in the abuse of dominant cases. With regard to the digital market, the most influential and comparatively comprehensive analysis of market definition is involved in the abuse of dominant position case, *2014AQ-iHoo*²³³³. It discusses the role of market definition, as well as the role of the SSNIP test in the assessment of two-sided markets.

In **Russia**, the most significant case is the merger between ‘Bayer AG’ (Germany) and ‘Monsanto Company’ (USA) in 2017-2018. In recent years, Bayer has been actively involved in smart agriculture. In 2015, Bayer purchased the digital agricultural platform Zoner, and in 2016, it acquired ProPlant. Bayer has also recently announced the commercial launch in 2018 of complex digital solutions in the agricultural sector, named

Xarvio. Furthermore, Bayer is a vertically integrated company which is also involved in different partnerships with equipment manufacturers, such as Bosch. Monsanto is one of the leaders of digital agriculture, having acquired in 2013 Climate Corporation and in 2016 Vital Fields. The company provides services on paid access to plant genetic information. These business segments represent a significant part of the total profits of the company. Interestingly, in assessing the merger the Russian competition watchdog did not follow a static approach focusing on market definition in the various product markets, but took a dynamic perspective defining as the affected markets the “integrated agritech markets” because separate seeds, agrochemicals and digital solutions are not any more that important for the competitive dynamic in this sector due to ongoing technological change. the FAS proceeded to analyse the markets of seeds, agricultural chemistry, and digital farming, while noting the fact that the emerging market is integrated agro tech solutions. All these markets were considered by the FAS Russia in the context of the global value chain approach, with a particular focus on the effects of the merger on Russian agro manufactures (consumers of agricultural products) (vertical competition), as well as on potential competitors of Bayer and Monsanto in the field of supplying such products to agro manufactures (horizontal competition). According to the authority, in view of the dynamic perspective taken it was important to analyse the transformation dynamics of such markets, taking a global perspective, in view of the effect of the global transformation of the sector to the alteration of the competitive environment in Russia in the short and medium term.

In particular, FAS Russia found that the merger affected the Russian market of highly-productive seeds material, which depends on the latest technologies and involves access to big data about genetics (data and data analytics). The merger had also effects on the crop protection market, as well as on the market for digital solutions for agriculture. Thus, in this case FAS has applied new methodology to identify the potential anticompetitive effects of the merger both in the Russian and global markets²³³⁴.

Similarly, in India, in assessing the *Bayer/Monsanto* merger, the CCI considered the global nature of the R&D in seeds, portfolio effects, digital farming solutions and access to platforms²³³⁵. The Indian competition law watchdog has been relatively flexible in the process of market definition, leaving the issue open in most cases involving digital economy issues we examined²³³⁶. The only example of more engagement with market definition

involves the acquisition, by Microsoft Corp. and Microsoft International, a wholly owned subsidiary of Microsoft, of substantially the entire the Devices and Services (“D&S”) Business of Nokia Corp. and related arrangements. This includes the mobile phones and smart devices business units. Both companies would also license patent rights to each other. The CCI found that the acquisition related to mobile handsets (including smartphones and tablets) and the operating systems used in them. The CCI distinguished between the various categories of handsets like basic phones, feature phones and smartphones and tablets based on their hardware configuration functionalities, usage and operating system.

9.4.2. Theories of harm

9.4.2.1. Traditional theories of harm resulting from horizontal overlaps and elimination of direct competition

Data mergers may raise traditional competition concerns if the merging entities are rivals on specific product markets affected by the merger in view of horizontal overlaps. The US competition authorities have examined competition concerns in cases involving overlaps between the merging entities when data is the relevant product. Such concerns were raised in the FTC’s challenge of CoreLogic’s acquisition of Data Quick²³³⁷. CoreLogic licenses national assessor and recorder bulk data in the U.S and was seeking to acquire assets and other interests, including DataQuick, from TPG VI Ontario 1 for \$661 million. The FTC defined the relevant market as that for national assessor and recorder bulk data. This type of data covers most properties across the U.S., and it consists of aggregated current and historical assessor and recorder data in bulk format. Purveyors of this data offer it for all properties in covered jurisdictions in a standardized form. It gives information about ownership, status, and value of properties. Parties interested in assessor and recorder data and information can access it from local government offices. National assessor and recorder bulk data customers process the data with proprietary programs and systems to generate internal analyses or to design value-added products. The products include risk and fraud management tools, valuation models, and consumer-focused property websites. Customers of this data cannot substitute regional assessor and recorder bulk data. They cannot combine data offered by regional firms because it will not convey the necessary geographic scope.

The FTC found that the acquisition could increase market power in an already concentrated market. Prior to the transaction, just three rivals competed in this market. DataQuick competed aggressively, offering lower prices and less restrictive contract terms than its two rivals. According to the FTC entry conditions would not have neutralized

https://www.cci.gov.in/sites/default/files/notice_order_summary_doc/C-2019-04-658.pdf; Visa International Service Association (Visa International) and Indialdeas.com Limited (Indialdeas), available at https://www.cci.gov.in/sites/default/files/notice_order_summary_doc/C-201812620.pdf.

2337 In the Matter of CoreLogic, Inc., Complaint, FTC Docket No. C-4458.

the anticompetitive effects of the acquisition because entry would not occur in a timely, likely, or sufficient manner. Entry requires several years of national historical data and the capabilities to offer “go-forward” national data. A potential entrant could not collect the necessary on-going and historical data cost-effectively. It also could not enter by obtaining a license to use the requisite data because neither company has an incentive to support a new competitor²³³⁸.

The FTC stated that the acquisition probably will substantially lessen competition and create a monopoly, violating Sect. 7 of the Clayton Act, 15 U.S.C. § 18 and Sect. 5 of the FTC Act, 15 U.S.C. § 45. The effects of the transaction would have eliminated direct competition between CoreLogic and DataQuick. It would have also increased coordinated interplay between CoreLogic and the remaining competitor, Black Knight. Finally the acquisition would have increased the prospects that CoreLogic unilaterally to exercise market power²³³⁹. Hence, both the agreement to merge and the acquisition violated U.S. merger law.

Theories of harm linked to the direct competition between the merging entities were also examined by US competition authorities in Google/DoubleClick²³⁴⁰. While Google had been developing a third party ad serving business, it had not released a commercially viable product. All online advertising does not coexist in the same relevant market, since pricing of one type does not constrain pricing of another. Even if it did, the merger would not eliminate direct competition because Doubleclick does not sell advertising inventory²³⁴¹.

In Bazaarvoice/PowerReviews²³⁴², defendant Bazaarvoice, Inc. Had acquired PowerReviews, Inc. in June 2012. Retailers and manufacturers buy product ratings and reviews platforms (PRR platforms) to generate consumer product ratings and reviews online. Bazaarvoice sold the market-leading PRR platform, and PowerReviews constituted its closest rival. No other PRR platform vendor had registered a significant number of customers in the U.S.

PRR platforms permit manufacturers and retailers to “collect, organize, and display” product ratings and reviews that consumers enter online. The platform owners post the information on a retailer’s or manufacturer’s website. Ratings and reviews can increase sales, lower product returns, and draw consumers to the customer’s website. The information maps consumer preferences and behavior, permitting insights regarding inventory purchasing or product design choices. It also can boost a retailer’s or manufacturer’s product ranking on a search engine results page. The algorithms of search engines rank websites with fresh and unique content higher. The PRR platforms frequently update ratings and reviews.

2338 Ibid., ¶ 10

2339 Ibid., ¶ 11

2341 Ibid., ¶ 7.

2342 U.S.A. v. Bazaarvoice, Inc., Complaint, Case No. 13-0133, ¶ 1 (N.D. Cal. 10 Jan. 2013).

PRR platform providers offer additional services, including moderation. This consists of focusing a software algorithm on a consumer review to identify inappropriate or fraudulent content. The merging parties offered syndication services, which permit manufacturers to share ratings and reviews with retail partners. The syndication network can display reviews on the retailers' website that a consumer wrote on the manufacturer's website. PRR platforms can feature analytics software that analyzes ratings and reviews, producing valuable information relating to consumer sentiment. The software enables manufacturers and retailers to better identify product design defects or spot consumers who have indicated an interest in marketing efforts.

Vendors and buyers individually negotiate the sales price for PRR platforms. Arbitrage does not occur in this market, in that customers cannot re-sell a PRR platform having purchased it. PRR platform providers set prices based on each customer's demand features. They seek to gather the maximum information about the customer and then offer a price that aligns with its view of the customer's willingness to pay. Suppliers also adjust the price in response to other competitive offers.

The FTC defined the relevant product market as PRR platforms that retailers and manufacturers utilize²³⁴³. It then said that the transaction will empower Bazaarvoice to profitably increase price on retailers and manufacturers located in the U.S.²³⁴⁴. Bazaarvoice acquired additional market power because the transaction removed its most significant rival. Potential customers regularly received competing quotes from Bazaarvoice and PowerReviews during contract negotiations. The competitive pressure that PowerReviews exerted frequently resulted in substantial price discounts, "sometimes in excess of 60 percent"²³⁴⁵. PowerReviews marketed itself as a low-price alternative to Bazaarvoice and actively courted Bazaarvoice's biggest clients. Even without winning a customer's business, PowerReviews' prices often set the ceiling on Bazaarvoice's offers, materially compressing its margins.

The FTC proffered evidence of the market power that the acquisition generated by referring to the Internet Retailer 500, an annual ranking of the 500 largest internet retailers in North America based on online sales revenue. In this grouping, more than 350 retailers display ratings and reviews. About 70 percent of these undertakings have bought PRR platforms from Bazaarvoice or PowerReviews. Most of the remaining websites rely on in-house PRR solutions²³⁴⁶. However, this option counted as impractical and cost-prohibitive for many retailers and manufacturers.

In addition to removing price competition, the acquisition was found to reduce quality competition that produced differentiation, new features, and that improved the functionality of the platforms²³⁴⁷. For instance, while Bazaarvoice constructed the first review syndication network that connected manufacturers and retailers, PowerReviews

2343 Ibid., ¶ 30.

2344 Ibid., ¶ 31.

2345 Ibid., ¶ 42.

2346 Ibid., ¶ 36

2347 Ibid., ¶ 50,

designed an open content syndication platform that enabled syndication between non-client manufacturers and retailers on the PowerReviews platform. After initially resisting customer pressure for similar features, Bazaarvoice relented and syndicated content to PowerReviews' retailers.

The FTC determined that entry or growth by rivals probably will not counteract the competitive harm that the transaction caused. Bazaarvoice benefitted from substantial entry barriers²³⁴⁸. The leading entry barrier consisted of a network effect in the form of Bazaarvoice's syndication network. The more manufacturers that buy Bazaarvoice's PRR platform, the more attractive the platform is to retailers, offering access to more ratings and reviews. This dynamic also works in the opposite direction, because more retailers permit manufacturers to syndicate content to more retail outlets²³⁴⁹. Before an initial public offering, Bazaarvoice publicly stated that it operates in a "winner-take-all" market. Most of the biggest retail clients already have bought-into Bazaarvoice's platform. By acquiring PowerReviews, Bazaarvoice extended the scope of its network and precluded fringe rivals from gaining the scale necessary to compete. The weakness of rivals further was found to raise switching costs²³⁵⁰.

Similar elimination of direct competition concerns because of horizontal overlaps were raised in CCC/Mitchell concerning \$1.4 billion merger transaction between CCC Information Systems Inc. (CCC) and Mitchell Int'l, Inc. (Mitchell) that would leave just two major suppliers of U.S. partial loss estimation systems (estimatics) and U.S. total loss valuation systems²³⁵¹. The FTC argued that this merger to duopoly would permit the merged undertaking, or the remaining two undertakings together, to exert market power, increasing prices while product quality and services would decrease. Estimatics are electronic systems "consisting of software and a database of U.S. passenger automobile parts, part pricing, and repair times". Customers purchase estimatics to determine an initial estimate to repair cars that have sustained damages in accidents. TLV systems constitute electronic systems with software and databases that list local market comparable values that its owners update frequently and that insurance regulations in all states accept. TLV systems add efficiency to the claims process and reduce time to settlement.

According to the FTC, the merger would have secured for the combined entity more than half of the sales in both the estimatics and TLV systems markets. The merger would have reduced the number of major competitors from three to two. This increase in concentration alone justified a presumption of anticompetitive effects. With regard to the theories of harm the FTC contended that the transaction would have eliminated direct competition between CCC and Mitchell, and would have facilitated coordination with the remaining supplier, Audater. The merger would have harmed insurance companies, repair shops, and American car owners.

2348 Ibid., ¶ 55.

2349 Ibid., ¶ 56.

2350 Ibid., ¶ 58.

2351 In the Matter of CCC Holdings Inc. and Aurora Equity Partners III L.P., Complaint, FTC Docket No. 9334.

The FTC viewed entry as difficult, costly, and risky due to the time and expense of building a viable database covering most cars on U.S. roads, of creating the requisite software, and of building the reputation for delivering accurate repair information. It would have also taken more than two years. Finding that the merger would substantially lessen competition, the FTC argued that it violated Sect. 7 of the Clayton Act, 15 U.S.C. § 18, and Sect. 5 of the FTC Act, 15 U.S.C. § 45.

One may also refer to the Verisk/Eagleview case, challenged by the FTC because it would have eliminated the largest and most capable rival for rooftop aerial measurement services and reports that customers use for insurance purposes²³⁵². The acquisition would have extinguished direct competition in Rooftop Aerial Measurement Products and between the transaction parties and post-transaction, Verisk would have constituted the only significant firm in the industry, with a fringe remnant holding 1 percent of sales in the market.

The target of the acquisition, Eagleview, controlled nearly 90 percent of the relevant market. Verisk held the critical technology, owning the dominant software platform that insurers access to use Rooftop Aerial Measurement Products and to estimate property damage claims. It also sold data analytics services. Eagleview collected aerial image data and sold that data to the insurance industry separately and as an input to Rooftop Aerial Measurement Products. Customers bought reports and information that permitted estimating the costs of repairing or replacing a rooftop.

The FTC defined the relevant product market as the sale of Rooftop Aerial Measurement Products for insurance reasons. Market power could persist in the market partially because insurance carriers will not switch to manual measurements in response to a small but significant non-transitory price increase. The transaction would give the combined undertaking a market share of 99 percent, with no meaningful rivals²³⁵³. The post-acquisition HHI would sail above 9900, increasing by more than 2000 points and amounting to over 7000 points above the threshold that the Merger Guidelines use to presume an illegal transaction.

Entry barriers would also have prevented rivals from cutting-into the combined entity's market share. The FTC stated that entry, repositioning, or fringe firm growth did not qualify as timely, likely, or sufficient to deter or neutralize the anticompetitive effects of the transaction. Potential rivals and the fringe lacked strong relationships with insurance carriers, needed to develop software that can compete with Verisk's dominant software, had weak revenue incentives to vigorously defend against patent infringement claims by Eagleview, which vigorously asserted them, and would need to earn product acceptance by the insurance industry. An additional entry barrier included access to a national library of high-resolution images and data²³⁵⁴. Consequently, the FTC found that the acquisition agreement and the acquisition itself violated Sect. 5 of the FTC Act, 15 U.S.C. § 45, as well as Sect. 7 of the Clayton Act, 15 U.S.C. § 18.

2352 In the Matter of Verisk Analytics, Inc., Eagleview Tech. Corp., Complaint, FTC Docket No. 9363.

2353 Ibid., ¶ 29.

2354 Ibid., ¶ 45.

9.4.2.2. Preventing potential/nascent competition theories of harm

Despite the relatively static perspective of the traditional competitive analysis performed in merger control, as there is significant emphasis put on the actual or potential (but within a short period of time) contestability of the markets affected, theories of harm relating to preventing ‘actual potential entry’ have been in vogue recently. Actual competitors are certainly considered in the operation of the definition of a relevant market that may be affected by the merger.

In the EU horizontal merger guidelines, a merger where the target firm is not competing in the same relevant market of the acquiring firm can still give rise to a significant impediment to effective competition (SIEC), whether non-coordinated or coordinated, if there is a realistic prospect that the former could decide to enter the market in the near future but for the merger in question.²³⁵⁵ The threat of entry is stronger where the target company already has, or is very likely to acquire, the availability of assets that could facilitate entry, such as a distribution network which overlaps with the one used by the acquiring firm.²³⁵⁶ Evidence of actual plans to enter at an advanced stage would point towards that conclusion.²³⁵⁷ However, the likelihood of a SIEC is reduced, if there are a sufficient number of potential competitors left able to discipline actual competitors.²³⁵⁸

Usually, EU competition authorities have taken a relatively narrow time scale for considering potential competition. To be an effective threat, potential competitors should be able to enter within two years and on a sufficient scale.²³⁵⁹ This can lead to ignore the possibility of potential entry into a market if the time scale of this entry may be longer than two years. The difficulty resides in finding evidence that the potential competitors may have such plans and that these are credible enough to influence the competitive strategies of the merging firms. Extending the time scale to a longer period than two years may lead to a high degree of uncertainty and increase the risk of arbitrary decision-making.

However, there can be circumstances where the threat of potential competition is less palpable but where a merger may be thought to give rise to a SIEC. It is often argued that the valuation of internet start-ups is very subjective due to the elusive nature of the key intangible asset underpinning their business model, that is, the acquisition of a large customer base. To this end, firms typically attract users by offering their services for free, thus incurring material operational losses for a number of years before the prospect of turning the venture into a profitable business. Furthermore, it is argued that once the customer base is in place, it is easier to launch new services thanks to the availability of a critical mass. Similar conclusions may be reached with regard to the possibility of a market becoming contestable in a medium term (e.g., five years), this assessment being based on the “idiosyncratic rent-earning resources” and capabilities,

2355 EU Horizontal Merger Guidelines [2004] OJ C 31/11, para 58.

2356 Ibid., para 59.

2357 Ibid., para 60.

2358 Ibid.

2359 Ibid., paras 74 and 75.

such as specific innovation and technological capabilities, that few other undertakings may have, that could provide them an advantage in entering a specific market, in particular if the structure of the industry is that of a global oligopoly. In this case, it is possible to argue that such resources and capabilities should be taken into account, even if there are no established plans or plans in the making to enter the specific market. But of course, such an approach will be subject to the criticism of considerably expanding the discretion of competition authorities to intervene, or not.

There has nevertheless been some evolution in the way potential competition has been considered in the context of mergers, in particular with the recent turn of focusing on innovation effects. It has been alleged that many established companies proceed to “killer acquisitions” buying out smaller start-ups or small and medium undertakings with the aim to discontinue the development of the targets’ innovation projects that may challenge their dominant position, thus pre-empting future competition²³⁶⁰ and this beyond the time period of two years usually considered. Indeed, if an additional investment in R&D by a potential entrant reduces the expected profits of a rival (and vice versa), because of its business stealing effect, then a merger between these two firms may internalise this negative externality, and reduce innovation. In this context, the European Commission has looked beyond the R&D pipeline to explore the dynamic resources and capabilities of the specific firms to innovate and the development of specific “lines of research.”²³⁶¹ It has looked, for instance, to investment in basic R&D that may with some degree of probability become eventually profitable, even if this probability remains limited, for instance 10%. This approach seems to expand both the locus and the time period that is usually considered in assessing actual or potential competition, as the Commission has examined the overlaps between the parties, not only at the level of innovation spaces, by looking to “early pipeline projects” and “lines of research,” but also at the level of the industry. The Commission has indeed taken into account the global characteristics of R&D organisations, that is, the resources, personnel, facilities, and other tangible and intangible assets dedicated to research and development.²³⁶² If such a broader analysis may be perfectly justifiable in order to assess the innovation effects of the merger transaction and reduce the likelihood of “killer acquisitions,” it would also make sense to adopt a similarly flexible perspective when assessing potential entry when this could constrain the pricing strategies of the merged entity. Unless one is to consider that price effects would merit a different approach than innovation effects. This could make a difference in some cases, in particular if it is reasonable to expect that the future competitor may have the incentives and ability to enter the market in the medium term, on the basis of its tangible and intangible assets, idiosyncratic resources and capabilities, possibly in view of some history of previous expansion in other geographic markets.

2360 Some analysis in the pharmaceutical sector argues that more than 6% of acquisitions every year are “killer acquisitions”: see C. Cunningham, F. Ederer, and S. Ma, *Killer Acquisitions* (2018), available at: http://faculty.som.yale.edu/songma/files/cem_killeracquisitions.pdf.

2361 A theory that has, for instance, influenced the approach of the European Commission in *Dow/DuPont*: European Commission, Case M.7932 *Dow/DuPont* (2017).

2362 *Ibid.*, para. 1957.

The effects of the merger on potential competition coming out from start-ups has also attracted the attention of the US competition authorities, which have, at several occasions, explored the application of the “actual potential entrant” doctrine.

The merger transaction between Questco and Mallinckrodt provides an illustration²³⁶³. The FTC and several states filed a complaint against Questcor for purchasing the rights to a drug that represented a nascent competitive threat to its monopoly (Mallinckrodt had acquired Questcor in August 2014). Questcor’s Acthar, a therapeutic hormone (ACTH), represented the standard of care for infantile spasms, which involved seizures during the first two years of life. The drug also treats a kidney disorder, nephrotic syndrome (NS). In 2001, Questcor purchased Acthar from Aventis for \$100,000 plus modest royalties. Aventis had charged \$40 per vial for Acthar. Questcor has increased the price by 85,000 percent, to over \$34,000 per vial. A course of Acthar treatment can cost over \$100,000. Doctors in Europe, Canada, and elsewhere treat patients suffering from the same conditions with Synacthen Depot, a synthetic ACTH drug. Acthar and Synacthen have approximate biological activities and pharmacological effects. Novartis determined to sell the rights to market Synacthen in the U.S. in 2011.

Questcor viewed Synacthen as a significant potential competitive threat to Acthar. During the bidding process held in June 2013, Questcor paid more than other companies to purchase the U.S. rights to Synacthen. The FTC characterized Questcor’s bid as a defensive purchase that it pursued to protect its monopoly over ACTH drugs in the U.S. The acquisition harmed competition by preventing a potential rival from developing Synacthen and launching it in the U.S.²³⁶⁴. The FTC stated that Questcor had monopoly power in the U.S. with Acthar, pointing to direct evidence including supra-competitive prices and the fact that it had restricted Acthar’s output. The FTC also sought to establish monopoly power with indirect evidence that indicated that Acthar maintained a dominant share of the market for ACTH drugs. Substantial barriers to entry protected that market²³⁶⁵.

Concerning direct evidence, the bidders for Synacthen expected to sell the drug profitably at a price materially below Acthar’s price, indicating that Questcor sold Acthar at a supra-competitive level. The expectation of sizable duopoly profits was substantially below the monopoly rents that Questcor was extracting. Questcor’s strategy of curtailing the output of Acthar and charging a high price caused health insurers to narrow Acthar’s usage to those for whom no effective therapeutic options remain.

In terms of indirect evidence of Acthar’s monopoly power, Questcor had not experienced any competitive constraints on its ability to increase the price of Acthar to supra-competitive levels. It did not price Acthar relative to rival drugs that treat the same indications. Acthar had secured a 100 percent share of the market for ACTH drugs in the U.S. Furthermore, the FDA has not approved any other ACTH drug for therapeutic

2363 FTC v. Mallinckrodt Ard Inc., Complaint for Injunctive & Other Equitable Relief, Civil Action No. 1:17-cv-00120 (25 Jan. 2017).

2364 Ibid., ¶ 8.

2365 Ibid., ¶ 20.

use. High entry barriers also existed in the U.S. ACTH market. To develop a similar drug containing ACTH (natural or synthetic) that qualifies as stable, safe, and effective would demand significant time, cost, and effort, along with a notable risk of failure. The steps necessary to enter the market increased in difficulty and risk²³⁶⁶.

The specific act that the FTC alleged that produced anticompetitive effects was acquiring Synacthen. Questcor's bid consisted of substantially more guaranteed money than rivals had offered, which ended the bidding process. While the FDA had not yet approved Synacthen, rendering it a preclinical drug, Questcor recognized the threat it posed to its pricing model as early as 2006. It approached Novartis about acquiring Synacthen in 2009. The three rival bidders for Synacthen had the necessary pharmaceutical expertise and financing to succeed in bringing the product to market. They conducted due diligence and wrote business plans and regulatory approval strategies. The Synacthen assets represented a proven formulation of the drug. Medical professionals used the assets to treat patients safely and effectively worldwide for decades. The Synacthen assets thus had a strong possibility of enabling an entity to commercialize a synthetic ACTH therapy in the U.S. A buyer would not have needed to create a synthetic drug *de novo* or develop the manufacturing and testing protocols attendant to producing the drug. In comparison to the three alternative bidders, Questcor had developed limited plans for Synacthen and had done little due diligence prior to submitting its bid. Questcor claimed it bought Synacthen to market the drug for non-Acthar applications. The FTC did not believe this claim due to the similarities between the two drugs, asserting that Questcor could have pursued the same therapeutic indications with Acthar²³⁶⁷. Consequently, the FTC alleged two counts: (1) the maintenance of monopoly power through acts that constitute unfair methods of competition that violation § 5(a) of the FTC Act, 15 U.S.C. § 45(a). (2) The same acts constituted monopolization that violates § 2 of the Sherman Act, 15 U.S.C. § 2.

A similar nascent/potential competition issue was raised in the FTC's challenge of Nielsen's proposed acquisition of Arbitron²³⁶⁸. At the time of the acquisition, Nielsen sold audience measurement services, including television and cross-platform capabilities, to content providers, advertising agencies, and advertisers. Arbitron sold various audience measurement services, including radio and cross-platform capabilities, to content providers, advertising agencies, and advertisers. Nielsen sought to acquire Arbitron for about \$1.26 billion.

The FTC viewed the relevant market as the market for national syndicated cross-platform audience measurement services. Advertisers utilize audience measurement services to identify programming content across platforms (TV & online) that target audiences probably will enjoy, to place advertising, and to offer other media buying options. Media companies use the same services to value their advertising inventory and to inform programming decisions.

²³⁶⁶ Ibid., ¶ 32.

²³⁶⁷ Ibid., ¶ 51.

²³⁶⁸ In the Matter of Nielsen Holdings N.V. and Arbitron Inc., Complaint, FTC Docket No. C-4439.

The FTC stated that the relevant market was nascent. At the time of the Complaint, a commercially available national syndicated cross platform audience measurement service did not exist. Nielsen and Arbitron have the best opportunity to develop that service because they are the only companies that maintain large, representative panels that can measure television with the necessary individual-level demographics. Advertisers and media companies prefer this source.

Discussing entry conditions, the FTC expressed the view that sufficient and timely entry or expansion into the relevant market probably would not deter or counteract anticompetitive effects that the acquisition creates. Recruiting a representative panel of individuals and developing the technology necessary to produce the data to measure the attention of television audiences requires significant funds and time²³⁶⁹.

In evaluating effects, the FTC opined that the acquisition would substantially lessen competition and tend to create a monopoly in the market for national syndicated cross platform audience measurement services. Specifically, it would eliminate future competition between Nielsen and Arbitron. It would increase the probability that Nielsen would exercise market power and raise prices for audience measurement services²³⁷⁰. Consequently, the FTC found violations of Sect. 5 of the FTC Act, 15 U.S.C. § 18.

Potential competition theories of harm may nevertheless face difficulties to be confirmed by the courts. Although this case is not related to the digital economy, the FTC experienced difficulties in relying on the “actual potential entrant” theory of harm when assessing the purchase by U.S. medical technology provider Steris Corp of British sterilization services provider Synergy Health Plc, which was opposed by the FTC mainly for potential competition concerns²³⁷¹. The FTC alleged that the transaction would hurt customers by eliminating likely future competition based on new sterilization technique, in particular as there was evidence that Synergy had scrapped its plans to enter the U.S. market and open U.S. plants that would use x-ray to sterilize medical devices, which would have competed with Steris plants that use gamma rays for the sterilization process. This theory of harm was nevertheless ultimately rejected on fact-related grounds by a federal court in Ohio, the Court finding that the FTC had failed to carry its burden of proof by a “preponderance of the evidence” and that the scrapping of Synerfy’s plans was explained by the fact that it found few customers interested in signing up. The FTC decided not to appeal²³⁷². Hence, successfully implementing “actual potential entrant” related theories of harm requires some preparatory conceptual work at the level of the reviewing courts.

9.4.2.3. Vertical theories of harm: Foreclosure

In *Google/DoubleClick*, the Commission unconditionally cleared Google’s acquisition of DoubleClick as it concluded that the transaction would not give rise to competition con-

2369 Ibid., ¶ 11

2370 Ibid., ¶ 12

2371 In the Matter of Steris/Synergy Health, Complaint, FTC Docket No 9365.

2372 Federal Trade Commission v. Steris Corporation and Synergy Health PL, (N.D. **Ohio** Sept. 24, 2015).

cerns on any of the relevant advertising-related markets. The merger transaction concerned Google, the leading provider of ‘sponsored search’ advertising (text ads that run alongside search results), which also operated an ad network, *AdSense*, and *DoubleClick*, the leading provider of ad server software for “display” advertising (graphical ads). An ad server is a piece of software that chooses which adverts to display when somebody looks at a webpage. Ad networks are intermediaries selling adverts, which bring together large numbers of publishers and advertisers, with wide differentiation in product offering. The principal rationale for the merger was to integrate *DoubleClick* with *AdSense* in order to improve the ad network’s quality, in particular in order to allow it to compete in selling rich media adverts. Indeed, previously *AdSense* had primarily only sold text ads. Some big advertisers and publishers use their own ad servers (for instance prior to the merger Google used its own software for *AdSense*). However, *DoubleClick* provided around 50% of third party ad servers used by advertisers and publishers for display adverts in EEA. The Commission dismissed concerns that Google could leverage its dominance in search advertising in the markets served by the target company, *DoubleClick*, which was a provider of ad serving, management and reporting technology worldwide to website publishers, advertisers and advertising agencies²³⁷³.

The main issue raised concerned the possible foreclosure effects of the merger to the extent that Ad serving tools constitute inputs into the delivery of ads and reporting services for publishers/advertisers. By acquiring *DoubleClick*, Google could therefore get control of the leading supplier of key input for competitors to its ad network *AdSense*. Two foreclosure scenarios were examined (based on *DoubleClick*’s position in ad serving, and Google’s position in search advertising/online ad intermediation). First, Google could exploit *DoubleClick*’s position in ad serving software to foreclose rivals to *AdSense*, for instance, by raising price of ad serving tools to competing networks, requiring customers for DC’s ad-serve product to use *AdSense* (bundling), or tweaking algorithms in DC’s ad-serve product to divert business to *AdSense*. Second, Google could exploit its own position in ad intermediation to foreclose *DoubleClick*’s rivals in ad servers, for instance by bundling online advertising space with *DoubleClick*’s ad serving technology.

In examining foreclosure, the Commission explored the incentive and ability of the new entity to foreclose. With regard to the foreclosure of rival ad networks by exploiting *DoubleClick*’s leading position, the Commission found no such ability as *DoubleClick* has “no significant market power”, switching costs were “manageable”, the cost of ad serving represented only 2-5% of online advertising costs/revenues for advertisers/ publishers and the network effects were not strong enough to induce tipping. The new entity would also not have any incentive to foreclose. Surely, rivals claimed margins from intermediation were significantly higher than margins from selling ad serving tools, hence the incentive to shift customers to *AdSense* through bundling, however bundling would not pay off because of the ease of switching. *DoubleClick* represented a “key input into distribution channels that compete with Google’s *AdSense*”. However, the combination of users’ databases was thought unlikely to provide “a considerable additional competitive

2373 Google/ *DoubleClick* (Case COMP/ M.4731) Commission Decision C(2008) 927 final (11 March 2008).

advantage". The merger also raised a portability issue as advertisers had to transfer "past" data from one system to another. It was, however, estimated that less than 1% of former customers would require the migration of historical delivery data upon switching.

With regard to the foreclosure of DoubleClick's ad server rivals by exploiting Google's "strong market position" (50-80% of search ad segment), the Commission found that the ability was unclear and was limited by a number of practical factors and that the new entity would have no incentives to foreclose as the margins on ad serving tools were low compared to the margins on Google's sales of search ads, so even small volume losses in advertising would outweigh gains from customers taking up ad serving tools. Consequently, the Commission found no damage to competition as "financially strong, vertically integrated competitors would not be foreclosed".

Although the Commission accepted that "it is not excluded that (...) the merged entity would be able to combine DoubleClick's and Google's data collections, e.g., users' IP addresses, cookies IDs, connection times to correctly match records from both databases" and that "(s)uch combination could result in individual users' search histories being linked to the same users' past surfing behaviour on the internet", therefore leading "the merged entity may know that the same user has searched for terms A, B and C and visited pages X, Y and Z in the past week", and that "(s)uch information could potentially be used to better target ads to users"²³⁷⁴, it did not take into account the strategic importance of the data collected by Double/Click, which contained information about a rich sub-set of the web-browsing behaviour of Double/Click users across all publishers' websites engaged in targeted advertising, and found no harm to competition in the fact that such aggregation of data could facilitate online price discrimination on the basis of such targeted advertising. The Commission accepted DoubleClick's justification that it collected behavioural data from its users only for legitimate purposes, such as improving the overall experience offered to advertisers, and the fact that these were aggregate data that could have been of limited use because of the confidentiality clauses included in the contractual arrangements with both advertisers and publishers and the possibility of DoubleClick's customers to switch to alternative ad serving providers in case DoubleClick violated the confidentiality provisions.²³⁷⁵

Foreclosure was also the main theory of harm in The European Commission's "shopping" case against Google²³⁷⁶. In a nutshell, the Commission found that by demoting shopping comparison sites in the rankings from its general search algorithm while giving special prominence to its own shopping services Google abused its dominant position in general search to unlawfully favour its own "vertical" shopping business. An interesting, if underplayed, aspect of the case is that the decision depends crucially on the finding that there are separate markets for general search and for shopping comparison services. Given that significant information on products and prices can be obtained by using gen-

²³⁷⁴ Ibid., para 360.

²³⁷⁵ Ibid., para. 277.

²³⁷⁶ Case AT.39740 — Google Search (Shopping) (2017).

eral search, the validity of this distinction eventually rests on the “value added” provided by dedicated price comparison sites. This provides some insight as to where the frontier between foreclosure of rival “vertical” sites and legitimate product design decisions for Google’s general search might lie.

The acquisition of WhatsApp by Facebook also provides an interesting example of this focus on anti- competitive foreclosure, and the difficulties of the current tests to take sufficiently into account data concentration²³⁷⁷. Facebook provides targeted online advertising services based on analysis of data collected from Facebook users. The Commission found that WhatsApp is offered only on smartphones²³⁷⁸, but not on tablets or PCs; and in any case it does not collect data valuable for advertising purposes. Facebook was also found to offer a richer experience compared to WhatsApp, which offers a ‘more personal and targeted’ one²³⁷⁹. Following the acquisition, Facebook could have strengthened its position in the market for social networking services by adding users and/ or additional functionalities. However, the Commission noted that the ‘consumer communications sector is a recent and fast- growing sector which is characterised by frequent market entry and short innovation cycles in which large market shares may turn out to be ephemeral’ and thus ‘in such a dynamic context’, ‘high market shares are not necessarily indicative of market power and, therefore, of lasting damage to competition’²³⁸⁰. The possible effects of this reinforcement of Facebook’s market position was mitigated by the fact that around 70– 90 per cent of ‘WhatsApp users were Facebook users and were therefore already within the reach of Facebook Messenger’, and that 60– 70 per cent of Facebook Messenger active users already used WhatsApp²³⁸¹. Although it was possible for Facebook to collect data from WhatsApp users (which are also Facebook users) and gain an advantage for targeted advertising, the Commission found that this would not raise competition concerns as there remained a sufficient number of alternative providers of online advertising services with access to user data valuable for advertising purposes. The Commission found that ‘there will continue to be a large amount of Internet user data that are valuable for advertising purposes and that are not within Facebook’s exclusive control’²³⁸². Indeed, ‘there are currently a significant number of market participants that collect user data alongside Facebook’, thus mitigating any exclusionary concerns²³⁸³.

The Commission also focused on exclusionary/ anti- competitive foreclosure concerns in the acquisition of LinkedIn by Microsoft²³⁸⁴. Microsoft provides software solutions

for customer relationship management, while LinkedIn offers a multi- sided platform, which enables users 'to connect, share, discover and communicate with each other across multiple devices and means'²³⁸⁵. The merger raised the concerns that the new entity will integrate into Microsoft Office LinkedIn's Sales Navigator, which has access to a database of around 430 million users and which could, therefore, become an 'important input' or 'must have' for the choice of enterprise communications services providers²³⁸⁶. This combination of LinkedIn's and Microsoft's user databases could have provided, to the extent allowed by contract and applicable privacy laws, Microsoft the possibility to exclude bits competitors in the customer relationship management market, by denying them access to the LinkedIn user database (an input foreclosure strategy), thus preventing them from developing advanced customer relationship management functionalities also through machine learning and predictive analytics²³⁸⁷. However, the Commission considered that even if LinkedIn data could become an input for third- party software providers, the transaction would not give rise to competition concerns because LinkedIn did not 'appear to have a significant degree of market power [. . .] in any potential relevant upstream market'²³⁸⁸ and because 'by reducing access to LinkedIn full data, [the merged entity] is unlikely to negatively affect the overall availability of data'²³⁸⁹ to the extent that LinkedIn data was 'unlikely to be essential'²³⁹⁰. Indeed, there were a number of alternatives sources of data available that were specialized in 'social networking services' (including 'vertical social networks'), such as Xing, Viadeo, GoldenLine, Academia, Behance, and Doximity²³⁹¹.

Of particular interest is the situation in Brazil. Within the merger review mandate, CADE may impose structural or behavioural remedies on transactions in the digital economy in order to address competitive concerns. It is interesting to notice that the vast majority of the mergers in the digital economy in the period were unconditionally cleared by CADE (following the general trend of approvals in other sectors as well). The authority has recognized in some opportunities that the risks of adopting a restrictive policy regarding mergers and acquisitions might discourage innovation, as some companies are launched with the future prospect of being bought by larger and more established players. In contrast, the Merger Guidelines also allow for an analysis based on the acquisition of a *maverick* (disruptive rivals), which could increase the concern with the merger as strategy to eliminate competitive pressure.²³⁹²

It seems that the Authority is taking a cautious approach in very dynamic and innovative markets, both in mergers and in antitrust investigations. It is worth noticing that, even

2390 Ibid, para 276

2391 Ibid, para 90.

2392 Idem p. 50-51.

though CADE has generally adopted a cautious approach to digital market, the Authority has imposed some relevant commitments or signed merger control agreements. An interesting example in this vein is the acquisition of Time Warner by AT&T. CADE approved the transaction with the execution of an Agreement for Concentration Control (i.e. negotiated remedies).²³⁹³ In Brazil, the acquisition basically resulted in a vertical relation between content and channel licensing activities of the Time Warner Group (programmer) and satellite pay-TV supplied by Sky Brasil (packaging and distribution), company controlled by AT&T. Time Warner was found to have high market power in the relevant markets of content and channel programming and licensing in Brazil. In Brazil, TW also offered digital video services through several platforms such as TV Everywhere, and others. In the pay-TV market for distribution, there is high market concentration, with Sky and its competitor Claro/NET as clear leaders.

The vertical integration could result in alignment of incentives that would harm competitors in both markets by means of exchange of sensitive information and more favourable negotiation conditions (i.e. discriminatory practices). CADE's main concerns were the incentives and capacity of Sky to discriminate other programmers that were rivals to Time Warner. Moreover, CADE considered there was the possibility of market foreclosure in the pay-TV market through licensing of Time Warner's content to Sky in favourable terms, harming Sky's rivals at the distribution level.

The Agreement executed with CADE established obligations of isonomic treatment in the markets of pay-TV programming and distribution. AT&T should keep Sky Brasil and Time Warner programmers as separate legal entities, with their own governance and administration structures. The exchange of sensitive information or information that could potentially result in discrimination was forbidden. AT&T must ensure that Time Warner's content offers to packaging and pay-TV distribution companies will be done on a non-discriminatory basis. Sky Brasil should not impose discriminatory conditions to distribute channels of programmers not related to AT&T/TW. In an innovative move, the parties accepted to be subject to a binding arbitration in case of disputes regarding discriminatory treatment.

One of the four cases blocked by CADE in the period had an important digital component. The attempted merger between Kroton and Estacio involved the two leading private education providers in Brazil.²³⁹⁴ The digital aspect of the merger was related to concentration in the distance-based education market. Although concentration in the on-site education market provided the main rationale for the blocking decision, the level of concentration in online provision of educational services played a key role in the reasoning, as well as in some other CADE precedents cleared with restrictions.

Theories of harm have not been clearly stated in the relevant caselaw in China. In *Wal-Mart*²³⁹⁵ seems to indicate that the concentration may produce non-coordinated effects

2393 Vote of Commissioner Gilvandro Vasconcelos on Proceedings 08700.001390/2017-14.

2394 AC 08700.006185/2016-56.

2395 Wal-Mart/Niu Hai [2016] Ministry of Commerce, available at <http://www.mofcom.gov.cn/article/b/c/201208/20120808284418.shtml>.

while there is no clear mention of such terminology in the original decision. In this case, the Ministry of Commerce (MOFCOM) issued in 2012 a conditional approval of the concentration, and in 2016 it issued an announcement to lift the additional restrictive conditions in the 2012 decision. In the 2012 decision, the MOFCOM noted that Wal-Mart could leverage its advantage in distribution, logistics and service network established in China's physical retail market to the E-retail business market where Yihaodian was active. This would substantially enhance the ability of the merged entity to compete in the E-retail market which raised a unilateral effects concern.

Vertical foreclosure theories were also central in the *Bayer/Monsanto* decision. Both Bayer and Monsanto were found to be vertically integrated agricultural companies present in the entire value chain of supply of agricultural inputs like crop protection, seeds and traits, digital farming solutions. Digital farming an agronomic decision-making tool for farmers based on data and advanced analytics that enables farmers to make more efficient agronomic decisions and optimise the usage of seeds, crop protection products and fertiliser, ultimately leading to a reduced use of these inputs.

The two companies have their own Information Technology (IT) platforms for the potentially lucrative data-driven smart agriculture market. Both the parties have also acquired various entities in the past focused on developing digital farming applications. Thus, the proposed combination of Bayer and Monsanto is expected to create one of the largest vertically integrated player in the agricultural market globally.

Although, at that point only Monsanto was offering IT solutions in India, Bayer was planning to offer its digital farming applications in India in future. The combined entity would be in a position to tweak its global digital applications to suit Indian conditions. Also, the parties have access to existing agro-climatic data which they would consolidate post combination and increase entry barriers for existing market participants as such data would be critical for any market participant to effectively compete with the Combined Entity.

The CCI noted that the vertical integration and access to data would enable the combined entity to offer packaged solutions to the farmers in the seed and traits value chain and the agrochemical supply chain through their digital applications that other players may not be able to, thereby increasing its market power. The Combined Entity would have the ability and incentive to foreclose other competitors. The CCI also noted that the Parties are active in closely related markets which could result in portfolio effects in the form of exclusion of competitors.

Thus the CCI was of the view that Combination was likely to have an AAEC in various markets and suggested several modifications.

Therefore, due to the Commission's insistence, Bayer had to undertake for grant of access to Indian agro-climatic data (soil, climate, environmental, weather, moisture data, growing degree day and temperature data) used for their Digital Farming Product(s) or Digital Farming Platform(s), on fair, reasonable, and non-discriminatory terms and through non-exclusive, non-transferrable, non-sublicensable, royalty bearing licenses

Bayer also had to undertake to connect to its digital platforms selling agriculture inputs to agricultural producers in India to potential Licensees.²³⁹⁶ Bayer also had to undertake to grant access to Indian agro-climatic data collected by its digital platform, to government institutions free of charge.²³⁹⁷

9.4.2.4. Conglomerate theories of harm: big data and diversity of data as an important barrier to entry reinforcing concentration

Mergers between undertakings controlling a high variety of data may aim to combine through their transaction a unique dataset that could provide the new entity a significant and durable competitive advantage that rivals won't be able to match, with the result that the merger will establish important barriers to entry/or expansion that would keep concentration high for the foreseeable future. The core of these concerns result from mergers in a conglomerate context.

In *Microsoft/Yahoo Search!*²³⁹⁸, the Commission considered that in a conglomerate context, the proposed transaction may increase Microsoft's ability to leverage its market power in areas other than online advertising (for example client PC operating systems and personal productivity applications) when negotiating distribution agreements for its search technology (for example by bundling products) which may ultimately affect users, however, it concluded that 'future harm appears to be unlikely to be significant'.

²³⁹⁹

In *Microsoft Skype*²⁴⁰⁰ similar conglomerate effects were identified due to Microsoft's dominant position in the market for Windows operating systems, the Internet Explorer browser and Office apps software. The conglomerate concerns identified were mainly three²⁴⁰¹:

- a) Microsoft could, post-transaction, differentiate Skype's user experience according to the platforms or the OS by degrading the interoperability of Skype with competing OS and platforms in order to favour user experience on its own OS or platform and consequently increase its market power in these markets. Microsoft could also differentiate its Windows' user experience vis-à-vis Skype's and WLM's competitors by degrading the interoperability of Windows with competing providers of consumer communications services in order to favour Skype and WLM and consequently increase their market powers in these markets.
- b) Microsoft could decide to integrate Skype and Windows or Skype and Office in order to increase Skype's footprint in the consumer communications market and make it a «must-have» product, creating or reinforcing its dominant position (i.e. tying).

²³⁹⁶ Para 200, *ibid*

²³⁹⁷ Para 201, *ibid*

²³⁹⁸ Case M.5727 *Microsoft/Yahoo Search!* (2010).

²³⁹⁹ *Ibid.*, paras 243-244.

²⁴⁰⁰ Case M.6281 *Microsoft/Skype* (2011).

²⁴⁰¹ *Ibid.*, paras 134-138.

c) Microsoft could also decide for the same reasons explained in the above paragraph to commercially bundle Skype with Windows or Office (i.e. commercial bundling).

Even though the Commission found that Microsoft had the ability to enter into these three foreclosure practices²⁴⁰², it concluded that Microsoft had no incentives to engage in any of the three foreclosure strategies.²⁴⁰³

On appeal²⁴⁰⁴ to the General Court by one of the complainants, the applicant argued that the Commission failed to take account of the conglomerate effects resulting from the concentration. The General Court noted that ‘the conglomerate effects theory advanced by [the applicant] during the administrative procedure is complex and abstract, whereas concentrations giving rise to conglomerates do not usually generate competition concerns’.²⁴⁰⁵ It concluded that ‘the foreclosure effect feared by the applicants therefore depends on a series of factors in relation to which it is not certain that they might all occur in a sufficiently near future, such as is necessary in order for the prospective analysis of the effects of the concentration not to become purely speculative’ and that ‘the market foreclosure effects of which the applicants complain are too uncertain to be considered a direct and immediate effect of the concentration’.²⁴⁰⁶

The recent *Apple/Shazam* merger involved two companies providing complementary services (software solutions platforms and digital music streaming services for Apple and music recognition apps for Shazam)²⁴⁰⁷. The merger was initially notified in Austria for regulatory clearance, as the transaction did not meet the turnover thresholds of the EU Merger Regulation. However, Austria submitted a referral request to the Commission pursuant to Article 22(1) of the EUMR. The Commission cleared the merger. The Commission found that the acquisition of Shazam did not provide a significant ‘data advantage’ to Apple, employing in this assessment four metrics, including the variety of data. With regard to the variety of data, the Commission acknowledged that both providers of digital music streaming apps and music recognition services collect similar type of device data (for example, device language, operating system), demographic data (for example, name, gender, age), and behavioural data (for example, user’s clicks in app) on their users and that therefore Shazam’s data could not receive a high variety score, the same type of data being available from other sources²⁴⁰⁸. Hence, for the purposes of providing recommendations and personalised suggestions to users based on their tastes, ‘several datasets are currently used in the market, in particular drawing on their own user consumption data (that is data on the music that users stream) as well as discovery data (that is data collected through various market intelligence sources on

2407 Ibid.

2408 Case M. 8788, *Apple/ Shazam* (2018), paras 318-319..

popularity of certain music tracks and future music trends)²⁴⁰⁹. For example, the Commission noted that ‘Spotify compiles a database of music discovery data, albeit based on different sources than music tag activity, and it has been very successful in providing personalized experience to their user through recommendations without the use of Shazam data’²⁴¹⁰. In contrast, Shazam ‘collects only music discovery data based on one possible (even if arguably important) source that is music tag activity’ and hence seems ‘to be one of the several data points that allow market players (artists, recorded music companies, digital music services) to understand which songs are trending in a given area’²⁴¹¹.

9.4.2.5. Other vertical/conglomerate theories of harm: panopticon power

Again in *Apple/Shazam*, the Commission found that while both Apple and Shazam are licensing music data, and both provide some online advertising services, these activities are not their core business, and thus the horizontal overlaps of the merger were limited. Any overlap between Apple’s and Shazam’s activities would arise only in a hypothetical overall market encompassing both the music charts data licensed by Shazam and the music charts compiled by Apple. These were different kinds of data, as Shazam offers music discovery charts, while Apple mainly music consumption charts. Also according to the Commission, even if post- merger Apple were to use some of its user data to strengthen Shazam’s position in the market/ segment for online advertising for music enthusiasts, this would not significantly impede effective competition, as major companies offer online advertising services on inventories far larger than Shazam, including Google and Facebook²⁴¹².

The main competition concerns raised by the merger were non- horizontal. In particular, the Commission focused a significant part of its assessment on the conglomerate non- coordinated effects of the merger resulting out of the combination of the data of Apple and Shazam. The Commission put forward a new theory of harm than input foreclosure or more generally vertical anti- competitive foreclosure effects, as it had done in previous data mergers, focusing instead on the fact that the new entity would gain access to commercially sensitive information regarding the upstream or downstream activities of its rivals. Indeed, a company may obtain critical information by becoming the supplier of a downstream competitor, this allowing it to price less aggressively in the downstream market to the detriment of consumers and to put competitors at a competitive disadvantage, thereby dissuading them to enter or expand in the market²⁴¹³. According to the Commission,

“[s]uch possible theory of harm differs from the vertical non- coordinated effects discussed in paragraphs 29 to 77 of the Non- Horizontal Merger Guidelines in so

²⁴⁰⁹ Ibid., paras 318-320.

²⁴¹⁰ Ibid., para. 320.

²⁴¹¹ Ibid., para. 321.

²⁴¹² Ibid., para 184.

²⁴¹³ Ibid, para 200.

far as it does not require the merged entity to directly foreclose access of its actual or potential rivals to supplies (input foreclosure) or markets (customer foreclosure). The qualifying element of the potentially anti- competitive conduct is in fact linked to the intelligence underlying that conduct, that is commercially sensitive information on the merged entity's rivals acquired through the vertical integration brought about by the merger. However, the conduct must also be liable to negatively affect competition, for instance because the merged entity can price less aggressively to the detriment of consumers or because it can put competitors at a competitive disadvantage²⁴¹⁴.

The Commission therefore examined the access of the new entity to commercially sensitive information, in particular in view of the fact that Shazam currently collects certain data on users of third- party apps, and in particular digital music streaming apps, installed on the same smart mobile devices where the Shazam app is installed (for both Android and iOS devices) and allows those of its users who are also users of Spotify to connect their Shazam account (anonymous or registered) to their Spotify account (free- premium or premium). Shazam could therefore gain access to some additional pieces of information on Spotify users, in particular Spotify premium users. This data enables the Shazam app to identify its users, for example, the email address or Facebook identifier for registered Shazam users and the advertising identifier for anonymous Shazam users²⁴¹⁵. It was in this context that the Commission assessed 'whether, through the acquisition of control over the Shazam app and Shazam's database, Apple could gain access to certain data on its competitors, and in particular on Spotify, in the markets for digital music streaming apps [. . .] and whether this could lead to any non- horizontal non- coordinated anti- competitive effects'²⁴¹⁶.

In assessing the possible anti- competitive effect, the Commission examined²⁴¹⁷:

- whether the information to which Apple would gain access as result of the merger is commercially sensitive information,
- the competitive disadvantage that Apple Music's competitors could suffer as a result of Apple potentially making use of that information,
- whether Apple would have the ability and incentives to use the commercially sensitive information acquired, and
- what overall impact such a strategy would have on effective competition.

With regard to the first issue, the Commission noted that '[w] hilst the Non- Horizontal Merger Guidelines do not provide a definition of "commercially sensitive information" [. . .] customer lists are indicated as constituting business secrets of an undertaking, together with quantities produced and sold, cost and price structure and sales strategy,

2414 Ibid., para 193.

2415 Ibid., para 199.

2416 Ibid., para 200.

2417 Ibid., para 209.

that is information whose disclosure could result in a serious harm to an undertaking²⁴¹⁸.

With regard to the second issue, the Commission accepted that ‘it is not sufficient to demonstrate that, through a merger, the merged entity would gain access to commercially sensitive information on its rivals, but that it is also necessary to show that access to that information could have a negative impact on competition’²⁴¹⁹. In assessing this element, the Commission took into account ‘certain legal and/ or contractual limitations on the use of this customer information’ by Apple post- merger, such as the GDPR²⁴²⁰ and the e-Privacy Directive²⁴²¹, which may affect the transmission of the customer information and its subsequent use. However, the Commission noted that the e- Privacy Directive does not prevent any technical storage or access for the sole purpose of carrying out the transmission of a communication over an electronic communications network, thus enabling Apple to lawfully store or have access to this customer information. Possible contractual limitations to the use of this data could emanate from the Android Developer Guidelines, which so far had provided Shazam access to data about which apps are installed on a user’s Android device, or by rivals to the new entity, such as Spotify, which, according to their developer terms and conditions of service, may restrict the use of Spotify’s user data by app developers and enforce it if, post- merger, Apple would aim to collect data for services that compete with those provided by Spotify²⁴²². Notwithstanding these limitations, the Commission found that the new entity could collect this customer information lawfully and proceeded to the analysis of the incentive and ability of the new entity to use this customer information to put competitors at a competitive disadvantage²⁴²³.

With regard to the third issue, the Commission found that it was unclear whether the merged entity would have the incentive to use the customer information for targeted advertising in order to put Apple Music’s competitors at a competitive disadvantage²⁴²⁴.

The final step in the analysis was the assessment of the impact on competition. The Commission did not find that this would be significant. Although it noted that ‘Shazam’s installed base allows it to gather the Customer App Information for a very high number of (music enthusiast) users’, it also found that ‘the same would be true for Facebook and Twitter, for example, which also collect information on their users’ interest’²⁴²⁵. Hence, the ‘data increment’ brought by the merger with Shazam would be unlikely to provide a

2418 Ibid, para 216. The Commission arrived at this definition by referring to the Commission Notice on the rules for access to the Commission file [2005] OJ C 325/ 7.

significant competitive advantage to Apple²⁴²⁶. The Commission's decision is remarkable in that it adds to the concerns raised by the possible exclusionary practices leveraging the merged entity's market position to adjacent markets through various strategies of input or customer foreclosure, the effects of possible conducts related to access to commercially sensitive information as a possible (independent) theory of harm.

Of particular interest is also the analysis by the Commission of the increased technical capabilities of the new entity, as a possible competition concern, although this might improve existing functionalities, or offer additional functionalities, on digital music streaming apps²⁴²⁷. In assessing these input foreclosure concerns, the Commission proceeded to analyse the *variety* of data to which the new entity would have access, noting that competitors collect similar types of data, and therefore access to valuable types of data will not be blocked as a result of the merger²⁴²⁸. Similarly, with regard to the *velocity* of the data (measured, for instance, by the average time spent by users each month on the app), the Commission found that Shazam collected users' data at lower speed compared to providers of music streaming apps²⁴²⁹. Competitors have access to a significantly higher *volume* of data than Shazam²⁴³⁰, and with regard to the *value* of this data, it was found that it did not represent 'a key asset and is not unique'²⁴³¹.

9.4.2.6. Innovation theories of harm

Competition authorities have been recently focusing on the possible effects of merger activity on innovation. The US DOJ & FTC Horizontal Merger Guidelines of 2010 were the first to include a specific Section on competition harm to innovation and product variety and explicitly considering that "(a) merger enhances market power if it is likely to encourage one or more firms to raise price, reduce output, *diminish innovation*, or otherwise harm customers as a result of diminished competitive constraints or incentives"²⁴³². In analyzing effects on innovation, the US competition authorities have often taken an "innovation market" perspective²⁴³³, or as this has been reframed in the 2017 update of the US DOJ & FTC Antitrust Guidelines for the Licensing of Intellectual Property, "research and development markets"²⁴³⁴. The US authorities have employed "innovation markets" or "research and development markets" concepts in order to assess competition effects in a number of cases²⁴³⁵. According to this approach, the US Agencies will delineate

2434 US DOJ & FTC Antitrust Guidelines for the Licensing of Intellectual Property, Section 3.2.3. (2017)

2435 The FTC has identified and referred to research and development markets in the following matters: Complaint, Amgen Inc., 134 F.T.C. 333, 337-39 (2002) (identifying a research and development market for inhibitors of cytokines that promote the inflammation of human tissue); Wright Med. Tech., Inc., Proposed Consent Agreement with Analysis to Aid

research and development markets, only when the capabilities to engage in relevant research and development can be associated with specialized assets or characteristics of specific firms”, the authorities seeking to identify three key effects: (i) the ability of the merged firm to reduce total market investments in R&D, (ii) the incentive of the merged entity to reduce the innovative effort and (iii) the impact of the merger on the efficiency of the R&D expenditure²⁴³⁶. This looks like a relatively demanding framework from an evidential perspective. In most recent cases, the US authorities seem to adopt a broader framework and have also challenged mergers for diminishing innovation even if the merger would eliminate potential competition from a relative small competitor, in particular when the smaller player has promising pipeline products. The theory of harm in these cases was the ‘actual potential entrant’ theory, a potential entrant merging with an existing competitor and thus leading to lessen future competition.

In the European Commission’s Horizontal Merger Guidelines, one of the effects to be analysed under merger control, is the ‘effect on innovation’²⁴³⁷. The innovation potential of the merging firms, in particular if “one or more merging parties are important innovators in ways not reflected in market shares”, is taken into account, irrespective of the levels of concentration that are usually considered by the Commission’s Horizontal Guidelines as raising competition concerns²⁴³⁸. Similarly, the EU non-horizontal merger guidelines list the diminishing of innovation as a competition concern for vertical and conglomerate mergers²⁴³⁹ and also state that mergers involving innovative companies that are likely to expand significantly in the near future will be extensively investigated even when the post-merger market share is below 30%²⁴⁴⁰. In a relatively recent Competition Policy Brief, the European Commission explains that harm to innovation may justify the Commission to consider that a merger between a firm present in the relevant market with a firm that is not actually present in the relevant market could lead to a significant impediment of effective competition²⁴⁴¹.

The Commission has actively considered innovation effects in a series of recent merger cases, either exploring the possibility that a horizontal merger will lead to a loss of innovation by eliminating pipeline products that would likely have entered existing markets or that would have created entirely new value chains, thus preventing consumers from increased choice and variety²⁴⁴², as well as non-horizontal vertical or conglomerate

mergers that would have harmed the ability of the merged entity's rivals to innovate²⁴⁴³. It has been alleged that in several of these cases the Commission has proceeded to establish a novel theory of harm, that of a significant impediment to industry innovation (SIII), as it has not explored the existence of specific innovation markets that could have been affected by the merger, the Commission relying, in order to find the SIII, on several negative views about the merger gathered from third parties, without assessing if the merger would lead to a reduction in the R&D spend/innovation incentives of the merged entity, its rivals and/or the whole industry²⁴⁴⁴. According to this view, the Commission's SIII theory is based on a presumption that regulatory intervention is warranted when a merger removes a "parallel path R&D", this being not in line with the standard of proof in EU merger control²⁴⁴⁵.

These criticisms are far-fetched as, first, it is quite difficult to explain why the competition authority should not assess, when examining the merger, what would be the merger's effects on innovation incentives in the industry. This can be done, without necessarily defining a specific "innovation market". Indeed, in the context of the Transfer of Technology Guidelines, the Commission has put in place a filter that confines detailed analysis to cases "that are likely to present real competition concerns", not based on market shares but on the existence of "at least four independent technologies that may constitute a commercially viable alternative, in addition to the licensed technology controlled by the parties to the agreement"²⁴⁴⁶. According to the Commission, '(i)n assessing whether the technologies are sufficiently substitutable the relative commercial strength of the technologies in question must be taken into account. The competitive constraint imposed by a technology is limited if it does not constitute a commercially viable alternative to the licensed technology'²⁴⁴⁷. Even if an agreement falls outside the safe harbour this does not create a presumption of incompatibility with Article 101 TFEU but simply leads to an individual assessment under the guidelines and Article 101(3) TFEU, the Commission's approach indicates that the main concern is the existence of sufficient choice in terms of independent technologies available in the market, thus showing that showing the emphasis put on the existence of various "independent" R&D paths or, more generally, technologies. Limiting the focus on innovation to just the adoption of the "innovation

2447 *Ibid.*

markets” approach seems reductionist and certainly does not represent the most recent competition law thinking, also of US competition agencies²⁴⁴⁸. It is also important to take into account the patent portfolio strength of the merging parties, as well as the existence of licensing and cross-licensing agreements and internal strategy documents in order to assess the possible effects of a specific merger on innovation.

One should not limit this finding on situations of high market shares but it may be also be relevant to emphasise the need to keep an eye on technological developments and the possibility of potential competitors that rely on different technologies than the dominant undertaking, even if they are of a smaller size than the dominant undertaking, to challenge the competitive position of existing value chains and replace them with new ones. Competition law should take into this form of disruptive competition, not only in order to relativize the finding of high market shares, but also when assessing restrictions to the potential competition from these disruptors.

In its recent decision on the *Dow/Dupont* merger²⁴⁴⁹, the European Commission found that the merger may have reduced innovation competition for pesticides by looking to the ability and the incentive of the parties to innovate. The Commission focused its assessment both on innovation competition at the level of *innovation spaces* within the crop protection industry and on innovation competition at the *industry level*. The Commission followed the same pattern in the context of the *Bayer/Monsanto* merger. A similar approach may be adopted for data mergers affecting innovation. The recent Report commissioned by the Commission on Competition Policy for the Digital Era also emphasises that ‘competition authorities should inquire whether acquirer and target operate in the same ‘technological space’ or “users’ space”²⁴⁵⁰.

In reviewing *Bayer/Monsanto*, the Russian FAS concluded that the merger would hamper innovation activity in the digital solutions for agriculture market decreasing competitors’ incentives to innovate, the merger becoming a barrier to enter the market for alternative agriculture software²⁴⁵¹. According to FAS, the high intensity of innovation and the rapidly changing business models in the markets for these products require analysis, not only at the level of the various product markets affected by the merger, but also at the level of the “integrated market of agricultural technological solutions”. With regard to the effect on innovation, FAS focused on the risks for competition in the market for digital solutions in agriculture. According to the FAS, the merger raises the risk of the emergence of a closed digital platform that will dominate the market and which will eventually reduce competition by squeezing out from the market alternative digital solutions from other companies. The control over the digital platform by the merging parties could influence the decision of agricultural producers to acquire other means of production (from seeds to agrochemicals). The decrease of innovative activity in the field of digital farming could also create barriers to entry into the market for digital plat-

forms. It could also have the potential to cut down the research activity of competitors, as these will lose the incentive of competing with the industry leaders. A closed and dominant digital platform will also become an important barrier to entry for the emergence of new small innovative projects in the fields of selection or agro chemistry, which could have been integrated without difficulty into open digital platforms. The decision does not provide further details about the assessment of the incentives and of the ability of the leading digital platform to foreclose the access of smaller competitors in their platform.

According to FAS, the new entity resulting from the merger would have access to accumulated data on genetic information, and will control technologies of accelerated selection, including technologies of gene editing, which enable the accelerated selection of certain given characteristics by means of digital algorithms and big data, including historical data. The control of these technologies and the significant market share of the merging entities in the relevant product markets provide, according to the FAS, the merged entity with the power to influence the decisions of agriculture producers, raising strategic barriers to entry into these markets for other companies which do not dispose of the same access to technologies, and therefore to significantly increase its share on the full range of the relevant markets. Indeed, the creation of a digital platform integrating the supply of key agricultural inputs makes it “virtually impossible” for independent producers of agrochemicals or seeds to enter the market, as well as for individual agronomic digital services not integrated into such a platform to have access to a critical installed base of consumers. According to FAS, in markets that are heavily dependent on ongoing technological transformation and innovation competition, market power should be conceived as the projection of the innovation potential of the merging entity. The joint merged entity would become a dominant player in a number of global product markets like genomic markers for some crops, digital farming solutions and even some seeds markets as well and would get an ultimate advantage in the agritech markets as it would combine a complex technological capability of the global scale that other companies lack. The consolidation of the R&D resources of Bayer and Monsanto and of their innovative potential will enable the merged entity to “dramatically increase” its market power in the relevant commodity markets, through various exclusionary strategies. In view of the established immunity from antitrust regulation for both the exercise of IP rights in the unilateral conduct context and also with regard to anticompetitive licensing agreements, this conduct could not be dealt *ex post*, by the antitrust law provisions, therefore, according to the FAS decision, making it necessary to deal with the possible situations of abuse of this market power *ex ante* through merger control.

9.4.3. The challenges of a more dynamic assessment of mergers: Counterfactuals, standard of proof, burden of proof

The assessment as to whether a merger would give rise to a restriction of competition is based on a counterfactual analysis where the post-merger scenario is compared to

a hypothetical scenario absent the merger in question. The latter is normally taken to be the same as the situation before the merger is consummated. The counterfactual analysis may be narrow and static, or more dynamic, depending on the specific case and the data available to the competition authority. In principle, competition authorities would take into account future changes to the market that can reasonably be foreseen. A classic example is where the target company to be acquired is expected to exit the market absent the merger.²⁴⁵² The identification of the proper counterfactual can be complicated by the fact that there can be more than one merger occurring in parallel in the same relevant market, which is a quite frequent scenario in the digital economy, as we have explored above. On the basis of the identified counterfactual, the competition authority then proceeds with the definition of the relevant product and geographic market, which is a propaedeutic step to inform the subsequent competitive assessment of the merger.²⁴⁵³ The analysis of the counterfactual is therefore particularly important for determining the boundaries of the relevant market.

In the context of the fast moving, from a technology and consumer preferences, perspectives digital economy, counterfactuals should inevitably become more speculative. As a recent report commissioned by the UK CMA acknowledges, predicting the evolution of the target in the absence of the merger (counterfactual) 'is especially challenging when, as is often the case, targets are young firms at the early stage of their development'²⁴⁵⁴. Indeed, '(i)n markets as dynamic as digital markets, evolution may be the result of the target's independent decision to change its business model and/or investments made by venture capitalists and/or the decision of other entities in the industry to purchase the target and integrate it in their own operations', therefore when defining the counterfactual to a merger, it is important that competition authorities 'consider the ability of the target to develop, on its own or attracting outside resources, as well as the likelihood of an alternative buyer coming along', which is an 'inherently complex' exercise²⁴⁵⁵. The report to the UK CMA concludes that competition authorities 'would need to be willing to accept more uncertainty in their counterfactual', and to be 'somewhat imaginative'²⁴⁵⁶. However, the report also notes that such a strategy may face difficulties as to the standard of proof competition authorities may face with regard to carrying out their burden of proof regarding the harm caused by the merger and the level of judicial scrutiny to which they may be subject to. The report concludes that it 'may be necessary to test the boundaries of the legal tests and constraints' that competition authorities face, the rapid evolution of digital markets and the risk of market tipping justifying 'a more risk-taking approach'²⁴⁵⁷.

2455 Ibid.

2456 Ibid., 46.

2457 Ibid., iv.

One may view a more flexible counterfactual test as a step towards a broader reform, if not of the substantive standard of merger control, at least of the decision procedures put in place. The Report to the CMA acknowledges that even if consumer harm cannot be precisely measured, it is possible that in the absence of clearly documented consumer welfare gains, mergers and acquisitions by digital platforms holding market power and aiming at reducing the competitive pressure they face should be forbidden on the basis of a ‘balance of harm’ approach that would take into account ‘the scale as well as the likelihood of harm in merger cases involving potential competition and harm to innovation’²⁴⁵⁸. This would weigh-up (i) the potential harm from losing a powerful rival; and (ii) the magnitude and likelihood of potential benefits to consumers (including increased quality and availability of innovative new services, heightened privacy)²⁴⁵⁹. This reform often calls for a review of the standards of judicial review so as to provide the necessary discretionary space to the competition authority for developing a more precautionary approach towards mergers in the digital economy²⁴⁶⁰, and is also eventually connected with the idea of reversing the burden of proof for some of these mergers in order to prove the efficiencies of these deals as a way to deal with the problem of ‘killer acquisitions’ affecting potential competition and against users defecting from the specific platform’s ecosystem²⁴⁶¹.

The Brazilian Competition Act provides a rebuttable presumption that any company with more than 20% of market share has a dominant position in its relevant market. Such a presumption must be assessed in light of several other factors that affect competition, such as contestability, entry barriers, and rivalry. Moreover, efficiencies may also be taken into account to clear a merger if they could not be achieved by means less harmful to competition and if there are appropriated by final consumers. The ultimate legal standard for assessing a merger is whether it “eliminates competition in a substantial part of the relevant market” or “creates or reinforces a dominant position” (art. 88, paragraph 5, of Law 12.529/11).

As a comparison, when it comes to antitrust investigations, Brazil adopts different standards of proof depending on the conduct. The wording of the Competition Act condemns any conduct that has as object or may have as effect an anticompetitive impact. Whereas in hard-core cartels cases the Brazilian competition authority adopts the per

2458 J Furman, ‘Unlocking digital competition, Report of the Digital Competition Expert Panel’ 13 March 2019 (‘Furman Report’, Recommendation Action 10, paras 3.88-3.100.

2459 Ibid.

2460 See, the recommendations made by the UK CMA following the Furman report, noting that ‘the current appeal procedures (such as the emphasis on oral testimony and the admission of new evidence at the appeal stage) should be reviewed as they are particularly damaging to the CMA’s ability to defend infringement decisions in fast-moving markets’: ‘The CMA’s response to the Digital Competition Expert Panel final report’ 22 March 2019 available at <https://www.gov.uk/government/publications/digital-competition-expert-panel-recommendations-cma-view>.

2461 See the proposals of the former chief economist of the European Commission, Tommaso Valletti and Crémer et al., *Competition Policy for the digital era* (Publications Office of the European Union, 2019), 11. For a different perspective see the Furman Report para 3.103, noting that ‘presumption against all acquisitions by large digital companies is not a proportionate response to the challenges posed by the digital economy’, preferring instead altering the standard of proof to a ‘balance of harms approach’.

se rule (although sometimes not explicitly), in unilateral conducts it adopts the rule of reason approach, balancing negative impacts and positive efficiencies in order to establish the net effect of a conduct.

The economic analysis of merger cases in Brazil involves the consideration of a counterfactual to the case under scrutiny. The counterfactual is often implicitly assumed to be the prevalent market structure and competitive pressure, which is contrasted with a formal or qualitative simulation of the merger effects.²⁴⁶² CADE also regulates the way that technical opinions should be submitted to constitute evidence.²⁴⁶³ There is no clear indication that mergers in digital markets receive a distinct treatment in these respects, by means of the projection of market counterfactuals. In short, the merger analysis, while prospective, is mostly static.

The recent Guidelines of Remedies in merger control, published in October 2018, are also helpful in assessing the design of antitrust interventions on merger control.²⁴⁶⁴ The Guidelines express a preference for structural remedies to address the competition concerns raised by a merger. When structural remedies are not available, or they are too expensive or compromise merger efficiencies, behavioural remedies may be adopted. That was the case in the acquisition of Time Warner by AT&T, in which CADE imposed only behavioural remedies. A general assessment of merger remedies in digital markets suggests that behavioural remedies are relatively more common than in other industries.

Article 28 of Chinese Anti-monopoly law provides that where the concentration may lead to elimination or restriction of competition, the concentration should be prohibited. However, if the undertaking can prove that the advantages of such concentration to competition obviously outweigh the disadvantages, or that the concentration is in the public interest, the concentration can be allowed. Despite this, there is no clear indication of how this rule of reason approach should be conducted.

9.5. Economics of digital mergers: a selection of topics

In this section, we discuss how the distinguishing features of digital technologies affect the economics of merger review and hence the validity of various theories of harm. While there is of course significant overlap with our discussion of recent cases, the emphasis is somewhat different. Not only do we focus more narrowly on “digital-specific” issues but we take a more normative approach, discussing what the theories of harm *should* be rather than what the arguments advanced by the competition authorities have been so far. We will therefore also consider potential issues and associated theories of harm which have not yet been (fully) analysed in actual cases.

2462 See Sections 4.1 and 4.2 of the Guidelines for Horizontal Mergers. According to the Guidelines, in merger effects simulation, some demand and supply parameters are estimated to try to measure what could happen in the future in relation to prices, controlling the efficiency gains derived from the transaction. p. 49-50.

2463 CADE Resolution 4 of 29 May 2012.

2464 Available at http://www.cade.gov.br/acesso-a-informacao/publicacoes-institucionais/guias_do_Cade/copy_of_GuiaRemedios.pdf http://www.cade.gov.br/acesso-a-informacao/publicacoes-institucionais/guias_do_Cade/

9.5.1. Market Definition

While market definition is not always necessary to analyse the likely economic effects of mergers, it is still an essential part of the joint legal and economic assessment of any transaction. The explosion of digital technologies complicates or modifies the often routine task of defining relevant markets in a surprising number of ways.

9.5.1.1. The Geographic Dimension

Assume that some of the products sold by the merging parties are sufficiently close substitutes to belong to the same relevant market. The geographic dimension of this market is then assessed by identifying the obstacles which might prevent a product sold in a location X to put sufficient competitive pressure on the same product sold at location Y. The most common obstacles leading to a finding of separate geographic market are substantial transportation costs, differences in language, tariffs or other regulatory barriers such as quality/compatibility standards or the local character of intellectual property protection. Of these factors, only transportation costs are unambiguously affected by digital technology. As discussed above, digital technology drastically reduces the costs of placing an order on a digital sales platform or on the site of a single seller. If the product purchased can itself be delivered digitally, then the compression of space is complete and, absent any other barrier, the geographic scope of the market for the product sold would potentially be worldwide. But what if the product itself still needs to be delivered through traditional transportation means?

Consider first a “single-sided” internet seller, e.g. a website selling only the products from one firm and not relying on digital advertising for financing. Even though the site can be reached from anywhere, the geographic scope of the market would be defined solely based on the obstacles faced for the physical delivery of the products sold. In this context, the organisation of the seller’s delivery operation provides some useful information.

Matters are more complicated for a two-sided sales platform which obtains a significant proportion of its revenues from online advertising. While the geographic dimension of the relevant markets for the goods and services sold would be defined in the same manner as for a single-sided seller, we must also define a relevant geographic market for the supply of advertising « space » which would normally include all regions from which a substantial number of customers log onto the platform. This principle applies as long as the platform is accessible only in a single language. From the purpose of defining the geographic scope of advertising markets two different linguistic versions of the same platform should essentially be seen as separate platforms²⁴⁶⁵.

2465 The only additional factor to consider is the benefit from “one stop shopping” for advertisers eager to advertise in several languages.

9.5.1.2. Individualised Pricing

Maybe the greatest challenge brought by the proliferation of digital technology and data is the emergence of new forms of pricing, which do not fit well with our traditional approach to market definition or with our traditional assessment of the likely effect of mergers on prices. Digital sellers have the ability not only to « recognise » previous buyers more effectively but also to collect, store and exploit information about this buyer's past behaviour in order to display products and prices aimed at maximising the seller's profits given the available buyer profile. Nor is the information in the seller's hands necessarily limited to her previous interactions with the seller's own sites. Not only are there tools extracting relevant information from the customer's visits to other sites but buyer-specific information can also be purchased from other sources, including other internet sellers or other internet platforms.

To understand the market definition issues raised by individualised pricing, consider internet sellers of digitalised books. How would we conceptually apply the SNIP approach? Because pricing is individualised, it would be tempting to argue that the SNIP test should first be applied at the level of each individual, i.e. that, potentially at least (the individual consumer is the market). While superficially attractive, this approach is a dead end. Suppose that we look at two different Amazon ebook customers and apply the SNIP logic individually to each of them. Consumer A is a complete Amazon devotee solely owning Amazon ebook-reading devices. Consumer B holds a number of reading devices accommodating a variety of formats and cares mostly about the price. Following the SNIP logic, B does not define a market onto itself, while A might. In a normal SSNIP exercise, one starts from the smallest possible identifiable market (in this case the individual) and progressively expand the market until the benchmark price increase is no longer profitable. But how do we apply this methodology when different consumers face different prices? One approach is to say that we cannot so that the only relevant question is whether or not a given individual would be part of a relevant market. In practice, this amounts to defining as many relevant markets as there are type A Amazon consumers. This does not make much sense. Firstly, this approach would be completely impractical when confronted with digital sellers catering to millions of consumers. Secondly, this approach essentially loses sight of what the broader logic behind the SNIP test is supposed to be.

When we think in terms of models of posted price competition it is natural to specify the market-defining experiment as an increase in the single price charged to all consumers. This « single price » actually combines two features: it is the price charged to each individual consumer and its levels reflects the degree to which the firm is constrained in its overall attempt to increase its profits. It is in fact this second feature of the uniform price that we are interested in when conducting the SSNIP thought experiment. The natural generalisation of this approach to a situation with individualised pricing is therefore not to conduct a SSNIP-like experiment on each individual price but to find a plausible way of expressing the level of market power corresponding to the firm's overall pricing strategy. In this view then, even with customised pricing, the correct thought

experiment is to imagine a 5% increase in the level of *each* of the individualised prices compared to what each individualised price would have been in a competitive market. Of course, the number of consumers lost to a price increase depends on the individual characteristics of consumers, but this is no different from the traditional uniform pricing SNIP experiment where consumers dropping out are those with lower valuations for the firm's version of the product. So, in our opinion, a slightly modified version of the SSNIP test still applies and there should be no presumption that individualised pricing lead to narrower relevant markets.

While individualised pricing should not much change our traditional view of market definition, another aspect of « customised marketing » has potentially more severe consequences : the seller or platform can choose the set of products between which the individual consumer gets to choose. The problem that this causes is more easily understood through an example. Suppose that buyers do not have a broad ex ante knowledge of the types of products available, e.g. they know that there are different types of books and know a few authors whom they like, but not much more. In this context the digital seller itself can play an important role in bringing potentially relevant books to the customer's attention.

Suppose that there are four books and two digital sellers. Assume that the first seller targets books A and B to the consumer, while the second seller targets books C and D. Do A and D, for example, belong to the same product market? The answer is not obvious. Clearly, if there were only two types of consumers, one type using only the first seller and the second using only the second, the answer would be negative. Imagine now that a portion of buyers « multi-home » in the sense that they look at the offering from both digital seller before deciding which book to purchase. If the proportion of buyers who multi-home is large enough then A and D would likely be in the same market since an increase in the price of A would lead to a significant loss of sales not only to B but also to C or D.

Let us now introduce heterogeneity in consumer tastes. Say consumer one's ranking of the books from most to least favorite is ABCD, while consumer two's own ranking is DCBA. Suppose however that these books are sufficiently close substitutes for both customers that all would belong to the same market if each consumers were made aware of all four books. However, each seller selects just a few books to suggest to each consumer. If both sellers have efficient targeting algorithms, they will both show A and B to consumer 1 and C and D to consumer two, so that, again A and D would not be in the same product market. Indeed, in this extreme example, multi-homing by consumers would still leave A and D in different markets. On the other hand, the two books are more likely to be effective substitutes if the targeting algorithms are not quite accurate. If, for example the first seller offers AB to consumer 1 but the second seller, with a poorer algorithm, offers B and D, then A and D can still be in the same market is sufficiently many type 1 consumers multi-home. Overall then, for a given amount of consumer heterogeneity, product market definition would still depend both on the extent of multi-homing and on the accuracy (or at least similarity) between the targeting

algorithms used by different sellers and the information that each seller is able to feed to its algorithm. So, how should we proceed? Should we still define markets in the usual manner, looking at products which are potentially substitutes without consideration for the impact of the marketing strategies chosen by the sellers? This would be consistent with the widespread view that, in most situations at least, markets should be defined based on the fundamental characteristics of products and of the technology used to produce them without any consideration for how firms *choose* to price or advertise these products. The importance of the marketing model prevailing in the industry would then be assessed as part of the evaluation of a given transaction but not as part and parcel of market definition. Or should we account for the lack of de facto substitution between products due to the sellers' marketing strategies as part of market definition itself?

Neither the academic world nor the Competition Authorities are currently well armed to address the challenges outlined in the example above.

9.5.2. Unilateral Horizontal Effects

9.5.2.1. Individualised Pricing and Consumer Targeting²⁴⁶⁶

We have just discussed how the type of individualised pricing enabled by digitalisation raises issues relative to market definition. Not surprisingly, individualised pricing also has implications for assessing the likely horizontal effects of a merger.

There is a large economic literature on competition with price discrimination. There is also an emerging literature on the specific type of discriminatory pricing implemented by digital sellers²⁴⁶⁷. The bottom line of the traditional literature is straightforward: by and large, allowing firms to price discriminate leads to more competitive outcomes. This should not be surprising given our previous discussion of market definition: with individualised sales, every consumer becomes a separate battle field. When doing battle for this one customer then, the firms are not hampered by the desire to keep sufficiently high margins on the sales made to other consumers, as would be the case with uniform pricing. This leads to more competitive outcomes. Just as in standard models of compe

2466 We do not discuss whether increase customising of offers achieved by only showing a subset of available products" is good or bad for consumer welfare. If it were harmful, then information sharing allowing for even more precise customising of offers might actually be undesirable.

2467 For example, see, Thisse, J-F and X. Vives, 1988, « On the Strategic Choice of Spatial Pricing Policy », *American Economic Review*, 78 :1, pp. 122 – 137. For a review of the traditional literature on discrimination in oligopoly, see Stole, L., 2007, « Price Discrimination and Competition », in *Handbook of Industrial Organization*, Vol. 3, Edited by Armstrong, M. and R.H. Porter, North Holland, Amsterdam. Recent papers on customised pricing include Chen, Z., C. Choe and N. Matsushima, 2018, « Competitive Personalized Pricing », Discussion Paper 02/18, Monash University; Choe, C., S. King and N. Matsushima, 2018, « Pricing with Cookies : Behaviour-Based Discrimination and Spatial Competition », *Management Science*, 6 :12 or Esteves, R-B. and J. Resende, 2016, « Competitive Targeted Advertising with Price Discrimination », *Marketing Science*, 35 :4. For earlier contributions, see Villas-Boas, J.M., 1999, « Dynamic Competition with Customer Recognition », *Rand Journal of Economics*, 35 :3, pp. 604 – 631 and Chen, Y. and G. Iyer, 2002, « Consumer Addressability and Customized Pricing », *Marketing Science*, 21 (2), pp. 197 – 208.

tition, the outcome of that battle depends on how closely the product offered matches the buyer's preferences and the (marginal) costs of the sellers. The firm with the combined product design + cost advantage wins at a price that leaves the other firm with zero profits. The impact of price discrimination on merger review is then conceptually straightforward : does the withdrawal of an independent seller increase prices more when initial competition is intense (as with price discrimination) or when competition is less fierce (as with Uniform Pricing) ? While there is no completely general answer to this question, much of merger policy is predicated on the belief that "loosing one firm" is less serious when competition is intense, except for the case of merger to monopoly. In this view then, for a given number of rivals able to sell to the consumer, customised pricing would if anything decrease the horizontal concerns from a merger.

There is a new twist however. The traditional literature on competition and price discrimination assumes that all sellers have the same information about all potential customers. In the digital age, where firms acquire significant information about the preferences of their customers, such an assumption is no longer appropriate. As a result, the match between product offered and consumer preferences depends very much on the (different) amount of information that the firms have about consumers. So, to the traditional « exogenous » product differentiation one must add an « endogenous » differentiation due to the fact that digital sellers typically manage the range of goods and offers seen by a given consumer based on the information that they have acquired about the consumer's preferences. In practice, this means that *one cannot assess the likely price effects of a merger with looking into how much the two merging parties and their remaining rivals know about individual consumers*. Again, this is best understood from a few examples.

There are 1000 customers purchasing products from digital sales sites or platforms. There are four main digital sellers, A, B, C and D. These sellers are differentiated in the sense that they have access to somewhat different sets of products which they can include in the offers tailored to each consumer. Each firm has a 25% share of sales. In a first scenario, all firms have the same information about each of the 1000 potential customers. In this case, our previous analysis applies : the market shares provide a good first view of the potential effects of mergers under the proviso that, with four equal-sized firm, an industry with individualised pricing is likely to be more competitive than a similar industry with uniform pricing. Now assume that there are two groups of consumers, 1 and 2. The only difference between these two groups of consumers is the information that various sellers have about their preferences and/or shopping habits. Suppose that firm A and B have good information about consumers in group 1, while C and D have good information about consumers in group 2.

To keep matter simple, assume further that A and B have the *same* information on customers and so have C and D. Suppose first that there is a merger between B and C. While this would still put upward pressure on prices, this effect would be mitigated by the fact that each battle for each single consumer would still involve two firms with good information on the consumer. More precisely, for each customer, we would go from two

well-informed suppliers and two poorly informed ones to one poorly informed supplier, one unchanged well-informed one and another well informed company but offering a broader range of products than B could on its own. Indeed, it is not clear that one can a priori rule out that the net effect of the merger would be beneficial to consumers since post merger competition for group 1 customers might well be more intensified than pre-merger. The same considerations apply to group 2 consumers. Now, assume that there is a merger between A and B. This merger does not improve the information available to any market participants²⁴⁶⁸ and hence does not extent the set of products which can be offered by a firm with adequate consumer information.

Generalising from these examples, there are two main points to be made. Firstly, in a world where digital sales enable customised pricing and make it possible for firms to acquire significant – but different – amounts of information about specific customers the « market », as defined in the previous section, is much more liable to segmentation so that one must pay close attention to whether the merging parties are or not “especially close competitors” not only in terms of products but also in terms of consumer information. Secondly mergers can have pro-competitive information-sharing benefits. The importance of such benefits is also likely to be larger if the merging parties have good information about different segments of the customer population.

Unfortunately, the emerging literature about competitive customized offers is not yet settled enough to provide us with many other robust insights. Still it is useful to understand what we have learned so far and what the main directions of current research are. There are two main strands of the literature, one where consumers actively manage the information that sellers can obtain about their identity and/or behaviour and one where consumers are passive in that respect.

To better understand the crucial difference between “passive” and “active” consumer environment, consider two firms trying to “poach” each other’s customers.²⁴⁶⁹ The “poaching” analogy is appropriate since, without uniform pricing, each customer is a separate « prey ».

“Passive” consumers are those who do not actively manage their personal information so that they can be readily identified by their current suppliers who can make tailored offered based on the customer-specific information which they hold. The intensity of competition between suppliers depend on two effects. The “defence” effect refers to the current’s supplier’s willingness and ability to fight off any attempt to steal some of its current customers. As explained above, individualised pricing increases this willingness to fight as the firm can offer better terms to the threatened customer without also having to offer better terms to others. This leads to more intense competition²⁴⁷⁰. The « offense » effect refers to the rival’s willingness and ability to « poach » by making a better

2468 Unless A and B has similar amount of information but somewhat different information, in which

2469 The “poaching” intuition goes back to Fudenberg, D. And J. Tirole, 2000, « Customer Poaching and Brand Switching », *Rand Journal of Economics*, 31 ;4, pp. 634 – 657.

2470 This is true as long as there is no fixed cost to targeting a rival’s customer. With fixed costs the very prospect of a fiercer response by the current supplier could discourage any attempt to poach in the first place, softening competition.

offer to the customer. Since the rival does not have specific information about the consumer it can only make a single, uniform, price offer to those it seeks to poach. The rival is more willing to make such an offer if it can be limited to the targeted customer, i.e. if it does not have to offer the same deals to its current customers. With passive customers, the rival firm is fully able to identify current customers and can then prevent them from choosing the « poaching » offer over their current personalised deal. This ability to screen out current customers leads to more intense competition.²⁴⁷¹

“Active” consumers can in principle manage their personal information in a number of ways. They can, for example, simply refuse to supply personal information to their supplier (e.g. by turning off cookies). This has both advantages and disadvantages. On the negative side, it reduces the supplier’s ability to display products which are more likely to appeal to the customer’s tastes and it makes it impossible to enjoy discounts offered to repeat customers. On the plus side, anonymity means that suppliers are unable to gauge the willingness to pay of the consumer and adapt their prices to extract most of the surplus. It also moves the customer into a segment of the market where rival suppliers compete on a more level playing field, which might result in tougher competition and lower prices. Alternatively, a consumer could *choose* when to have its cookies on or off, i.e. when to be recognised as a specific individual buyer and when not too. Such a strategy offers a better trade-off to consumers since they can get some of the benefits from receiving tailored offers while keeping the ability to evade individualised pricing aimed at extracting a large share of her surplus.

We can now see how the consumer’s ability to actively manage her information affects the intensity of competition. The « defence » effect discussed above is unchanged and works toward intensifying competition. On the other hand, an active consumer could “turn off” her cookies in order to benefit from the better offer made to the consumers that her supplier is trying to poach. This, in turn makes poaching more costly as the supplier loses revenues on current consumers switching to the lower priced offer. This decreases the incentives to poach and hence decreases the intensity of competition. Indeed, if the quality of information is such that each firm can perfectly discriminate across its own customers, Chen & Lyer (2018)²⁴⁷² show that any incentive to “poach” disappears : each firm can then extract the full consumer surplus from its consumers.

While there are currently no papers formally investigating the effect of individualised pricing and potential strategic behaviour on the part of consumers on mergers, one can still draw some lessons and raise a few issues. The first lesson is that one should not conclude too easily that the individualised offers enabled by digitalisation lead to tougher competition and hence to a likely lessening of merger-related price increases (except for merger to monopoly). Two further factors should be taken into account: the informational *asymmetries* between suppliers and the rules governing the use and ownership of personal information. As explained above, information asymmetries lead

2471 This is similar to the switching cost literature where the ability to discriminate between “captive” and “new” customers leads to more intense “second period” competition.

2472 Chen, Y. and G. Lyer, 2002, Consumer Addressability and Customized Pricing, *Marketing Science*, 21 (2), pp. 197 – 208.

to market segmentation, which can either lessen or increase the loss of competition due to a merger. More importantly perhaps, it does not seem possible to assess the effect of digitalisation on mergers without knowing what the rules governing the ownership and use of personal data are.

For example, are internet sellers allowed to decline service to potential clients who refuse to activate cookies? If they are and do, then we are in the “passive” consumer environment described above. If they are not or do not, then consumers have at least the opportunity to actively manage their online identities, which can affect the intensity of competition and hence the assessment of mergers. But do consumers actually manage their individual profile in order to obtain better deals? we currently do not know the answer.

Similarly, ownership matters, not only for merger review but for the design of potential remedies. Suppose first that companies own the consumer data that they collect through their own operations. If the merger raises concerns in terms of prices to final consumers and/or conditions offered to other sides of a digital platform (e.g. advertising), sharing of customer data with third parties might increase competitive pressure on the merged entity.

Suppose now that property rights over consumer data remain with individual customers. In principle, this means that consumers control access to their personal information. However, it would be a mistake to assume that such an allocation of property rights automatically solve concerns about market power and competition. Indeed, as we have seen above, allowing consumers to hide their personal information when it is in their private interest to do so can actually lead to a substantial lessening of competition. This is just one example of an important theme: individual consumer decisions regarding their personal information do not necessarily go in the direction of maximising overall consumer surplus. Another example of this issue arises with the sale of personal data. In particular, consumers who have property rights on their own personal information would have the right to « sell » this personal information. However, companies would have an incentive to pay a higher price for information to which they have *exclusive* access. While selling at this higher price would be individually rational for a consumer, the very fact that firms can gain exclusivity over this information would likely decrease the intensity of competition or impede entry.²⁴⁷³ Again this suggests that voiding some exclusivity clause might be a useful remedy in a merger context. Moreover, one should also consider that a merged entity pooling its exclusive customer data is less likely to offer access to these data to rivals at attractive terms than each of the entity was before the merger. In other words, not only is data exclusivity a potential source of remedies, it is a potential basis for a theory of harm.

2473 See Rasmussen, E.B., J.M. Ramseyer and J.S. Wiley Jr, « Naked Exclusion », *American Economic Review*, 81 :5, pp. 1137 – 1145, and Aghion, P. and P. Bolton, 1987, « Contracts as a Barrier to Entry », *American Economic Review*, 77 :3, pp. 388 – 401, for different explanations of why individual buyers might act against the common consumer interest.

9.5.2.2. Advertising

Several important digital companies rely on a business model where they derive significant income from the placing of digital ads on their sites. This is true of internet sellers (Amazon), social media companies (Facebook) and search companies. A common feature of these otherwise rather different firms is that they offer the possibility of tailoring the distribution of ads to the characteristics of individual consumers. This means not only that targeted customers are more likely to read the ad and act on it, but also that a given company can actually choose which particular format of its ad the consumer is exposed to. Clearly, the ability to target ads in such a manner is a significant competitive advantage for ad-space offering sites or platforms. This reinforces the importance of customer-specific data in merger review.

In this case, however, the main issue is not how this data and its ownership interacts with individual pricing and market segmentation. The main issue is one of scale, for two reasons. Firstly, advertisers might face a fixed cost in designing their ads for a specific platform. This puts a premium on platform with a large base of customers. There is nothing specific to digital platforms here, except maybe for the fact that the portability of ads across platforms (and hence the fixed cost above) depends on the digital formats chosen by different platforms. Secondly, experience with a larger number of customers and the data resulting from this experience are likely to lead to better ads/consumer matches, making the platform more attractive to advertisers. While some might think of this type of scale effect as solely an efficiency, they are still relevant when assessing whether a merger is likely to create excessive market power or even a dominant position.

9.5.2.3. Data

The importance of data has already surfaced as a significant factor in our discussion so far. We saw that, for internet sellers, data about consumers can lead to market segmentation and that, for businesses relying on targeted advertising, it is important to understand the magnitude of data-specific scale economies. But data is even more pervasive than this in the digital world. Indeed, if we refer back to Table 1, we see that data matters for essentially all types of digital products and services.

While the collection and use of data has been a main theme of the ongoing debate about policing the digital sector, intellectual honesty forces us to recognise that very little is known about how truly important data is within various business models. By this we do not of course mean that data does not matter. It clearly does. The accuracy of search algorithm does rely on the exploitation of huge quantities of data, data does help improve logistics and train all sorts of algorithms, including those in robotics. However, from the point of view of merger policy we need to know how the value of data *changes* with the amount and type of data collected. We also need to know how long-lasting any data advantage might be.

Let us start with the marginal advantage derived from access to additional data. This

clearly depends on the type of data involved and what this data is used for. In search, the main issue is how much better the algorithm can get if it can rely on even more billions of data points about what consumers search for and where the best answers can be found. Is the additional advantage mostly exhausted at the level of data obtained by Google? Is the data advantage of Google over Bing significant? While there is some evidence that additional data is still useful at very large levels to help give better results for unusual searches we just do not know very much about the magnitude of this effect or the value that consumers place on these “tail” searches. What about data about the users themselves? As discussed above such data is used to target advertising more effectively and can also be used to price discriminate across consumers. But how much does one really need to know in order to perform such targeting/tailoring proficiently? How much does additional information about the same consumers help? Also, while the goal is to design an environment which is specific to a single customer, how much information about a given customer can be inferred from data about other customers with similar characteristics? Finally, do consumers actually enjoy such a personalised treatment? Up to what point? Are some consumers liable to reject this approach for environments where they are freer to search for new items and do not have to fear being charged higher prices than their neighbours? Similar issue emerge in AI/robotics. Suppose that a firm designs face recognition software. This requires very specific data set with a large number of individuals photographed from a significant number of view points. These are not readily available. So what is the effect of a merger between a firm with a data set of size X and another firm with a data set of size Y ? Furthermore, as the face recognition products are sold and used in the market, does the usage data go back to the product designer? How useful is it? What is the marginal value of additional data?

Unfortunately, it is hard to conduct a cogent merger policy with respect to data without knowing the answers to such questions. If all that matters is the depth of knowledge about a given individual and there is little inference from one customer to the other, then the joining of two firms with information about different sets of individuals does provide any significant advantage to the merged entity. Even mergers between firms with knowledge about overlapping groups of consumers would not have much of an effect through the “data channel” if the marginal return from knowing “even more” about a given user is small, either because the improvement in targeting would be small or because any further increase in targeting would risk disenfranchising a sufficient number of customers.

The marginal value of new data also depends on the speed with which the information contained in old data depreciates. In search, for example, both the type of query favoured by the public and the sites where appropriate answers can be found changes constantly. So, how useful is three years old data? Ten years old? If we are to conduct a reliable review of mergers on the data side we need to have some knowledge of these rates of obsolescence. Obsolescence also matters when it comes to ad/product targeting. Are consumers’ preferences relatively stable over time or not. Does it depend on the type of consumers, on the type of products, on the types of sites?

Table 9.2 : Type of data

Type of Data		Social Net-works	Sales Channels/ Platforms	Search	Robotics
What is it About ?	Consumers	XX	XXX	XX	X
	Sought-After Information	X		XXX	
	Others				XXX
What is it Used for ?		Network Expansion Ads Targeting « Viral » Communication	Product Targeting. Ads targeting. Custom Prices	Improve Search Ads targeting.	Training + « feeding » AI Algorithms
How is it Obtained	By-product of main Activity	XXX	XXX	XXX	XX
	Bespoke				XXX
	Public source			XX	X
How Easy to Replicate ?		Medium (ads) Hard (Links)	Medium	Hard (search) Medium (Ads)	Wide Range Depending on Task and Environment
Useful Life-time		Medium to Long	Short to Medium	Short to Long	Depend on task and environment.

While we feel somewhat apologetic about turning this section into a set of questions, we believe that it is important to acknowledge the lack of information which is currently available to competition authorities in order to properly evaluate the role of data in digital mergers. This affects not only the authorities' ability to substantiate possible theory of harms based on foreclosure and hence to implement access remedies, it also makes it hard for merging entities to make data-related efficiency arguments convincingly.

Overall then, even though it might sound trite, we believe that the best approach, while we wait for more research to answer the questions above, is to look at the role of data on a case by case basis, hopefully with the help of credible information provided by the parties or the complainants. This might eventually help us to isolate more general principles, the necessary evidence for which is currently sorely lacking.

9.5.3. Efficiencies

When dealing with traditional mergers, Competition Authorities mostly focus on variable cost efficiencies. These are seen as a proxy for marginal costs and hence as more likely to be at least partially passed on to consumers. A rather general feature of digital sectors such as telecom, digital selling or search is that marginal costs are very small so that traditional merger-specific efficiencies are likely to be extremely small. Significant efficiencies must therefore come from somewhere else.

We encountered one such type of efficiency in section 6.1., where the sharing of customer-specific information between the merging parties could lead to increased competition in some segments of the market. In a sense though, this type of « efficiency » is very similar to the data-related efficiencies discussed in section 6.3 as it is more likely to arise if the merging parties hold information about different types of consumers or at least different aspects of consumer behaviour. In other words, these efficiencies stem from some form of *complementarity* between the information held by each of the companies. Indeed, it seems hard to identify any pervasive source of “digital” efficiencies which cannot be tracked back to data/information complementarities. For example, one might argue that, for companies needing to « train » algorithms, especially AI, access to more proprietary data leads to an improvement in the quality of the product offered to customers. However, additional training data is only useful if it differs in some dimension from the data already controlled by the other merging partner. What matters then is not scale itself but the complementarity between the data sets contributed by the two parties.

Another potential source of efficiency is an increase in the interoperability of algorithms or in the compatibility between data sets. For example, if a company like Google acquires a company providing a « vertical » specialised search service, such as a price-comparison site or a news service, one cannot a priori reject possibility that a smoother interaction between Google’s general search algorithm and the specialised vertical algorithm might be achieved. Clearly, assessing the existence and magnitude of such efficiencies is well beyond the ability of most competition authorities and requires that relevant technical expertise be made available to them in the near future. Of course, one needs to check whether these potential efficiencies are likely to be merger-specific. There are good reasons to believe that they might be as achieving smooth operation between fast changing proprietary algorithms might not be possible without revealing some of the original – and hence valuable, features of these algorithms. In a similar vein, a merged company might be more likely to harmonise the format under which valuable data is available, saving on transaction costs and achieving scale effects *which would not have been reachable pre-merger*. In this last case though, one should still compare the benefits achieved through the merger to common policy alternatives such as the development of standards. The potential efficiencies associated with innovation are discussed in the next section.

9.5.4. Innovation

Our discussion of mergers and innovation broadly follows Régibeau and Rockett (2019)²⁴⁷⁴. As for the price/quantity aspects of mergers, the first step is to determine the horizontal overlap between merging parties in downstream product markets and/or technology markets, requiring divestment when this overlap is significant enough and not compensated by clear efficiencies. There is nothing specific to digital sectors at this level.

The second step consists in examining types of efficiencies which are both merger and innovation specific. These efficiencies are listed in the following table.

Table 9.3 : Innovation-Related Merger-Specific Efficiencies

Source of Efficiency	In a Nutshell	Digital?
Internal Diffusion of Knowledge	Unless technology/data is easily licensed pre-merger or spills over easily, the merger leads to better sharing between the parties.	Potentially important : algorithms do not enjoy strong IP protection, making licensing unattractive. Less obvious for data.
Spillovers	The merger facilitates partial internalisation of spillovers, increasing incentives to innovate.	Weak : algorithms and data are closely guarded. However, the mobility of critical personnel might in some cases create significant spillovers.
Coordination of R&D Investments	Avoid duplication of effort	Likely to be strong in AI.
Sequential/Complementary Innovation		Strong in innovation related to standard-setting, especially data communication standards
Legal Certainty	Reduces threat of IPR litigation due to ambiguity of IPR coverage.	Strong in standard-setting context, weaker otherwise.

While mostly self-contained, Table 9.3. calls for a couple of comments. Firstly, the benefits from coordinating R&D investments can only be significant for « directed » research, i.e. for research efforts specifically directed at solving well-defined problems. The potential for such synergies will therefore depend on the specific digital sector considered. For example, there might be significant savings in « training » a single AI face-recognition algorithm which can then be shared internally. Secondly, mergers make IPR litigation between the parties unnecessary. How much this matters depends on two opposing forces. On one side, the scope of protection granted by IPRs on digital technologies tends to be fairly vague, at least compared to other sectors like pharmaceuticals or Chemicals. This means that legal uncertainty can be considerable. On the other hand, except for standard essential patents, there has not been much litigation of digital patents, suggesting that the fear of litigation might not have much of a chilling effect on innovation.

Still following Régibeau and Rockett (2019), the third step involves checking whether the parties significantly control some hard to replicate inputs into the innovation process. If so competition authorities should investigate the potential effect of the merger on the parties' ability and incentives to withhold (or increase the price of) such inputs from rival

2474 P. Régibeau & C. Rockett, Mergers and Innovation, (2019) 64(1) Antitrust Bulletin 31.

firms conducting innovation in similar technological fields. As discussed in section 6.3., data seems to be the most likely source for such concerns in digital sectors. This can be contrasted with recent cases such as the *Dow-Dupont* merger²⁴⁷⁵, where the European Commission demanded the divestment of one of the parties' whole research team in a given R&D area or the *GSK-Novartis* "swap"²⁴⁷⁶, where a condition for approving the transaction was that GSK would preserve R&D capability in oncology after ceding its oncology division to Novartis. In both cases, the concern was that not only qualified personnel but effective research *teams* would otherwise be a scarce resource that other rivals would struggle to replicate. In this respect, while specific, long-standing, research teams might also be an issue in some specific areas of digital research, the bread and butter of a large part of research in digital sectors involves skills which are relatively widely available and can be transferred more easily from one area of research to others than in other sectors.

9.5.5. Tacit Collusion

There is a lively literature on how algorithms, and especially AI-based algorithms, could be used to facilitate tacit collusion between rivals. The basic idea is simple. We know that coordination between independent parties is easier to achieve and maintain if the parties can agree on a common price (or a set of targets), can detect any deviation from this agreement quickly and precisely and can react to such deviations quickly. Moreover, reactions to deviations are more effective if they can be narrowly targeted at the rogue party.

One can reasonably argue that algorithms which roam the internet to check for prices and might even be used to automatically affect the firm's own behaviour tick most of these boxes²⁴⁷⁷. Several aspects of such algorithms matter. The first aspects are information reach and speed. If firm A uses such an algorithm, then it can monitor prices more thoroughly, detect price changes by rivals more quickly and react immediately. A second aspect is the algorithms' ability to design more individualised pricing schemes. This makes it easier to target any possible « retaliation » to the customers of the deviating party. A third aspect stems from the potential AIU dimension of algorithms.

If firms use advanced AI algorithm, then they might be able to coordinate their actions with very minimal human involvement. Moreover, the line between unilateral and coordinated conduct can be blurred. This is because an AI-intensive pricing (for example) algorithm would not even need to be fed any « targets » to coordinate on. It can, through its interaction with other firms' algorithms simply « learn » what the appropriate targets are and « learn » what the best enforcement strategies are. In fact, the profit-maximising strategies eventually adopted by AI algorithms need not even closely resemble the type of « target, deviation, punishment » approaches that companies – and competition au-

2475 Case M.7932 – Dow/Dupont (2017).

2476 Case M.7276, GSK-Novartis (2015).

2477 There are opposing effects. For example, complex algorithms could also be used to cover up cheating on the agreement. See Ezrachi, A. and M.E. Stucke, *Virtual Competition*, (Harvard University Press, 2016).

thorities – tend to rely upon. So not only do AI algorithms help solve the issue of finding something the parties can agree on, establishing infringement would likely require expertise not currently available to most Competition Authorities.

While the possible impact of digitalisation on tacit collusion is beginning to be well understood, the consequences for merger policy are much less clear. There are three main reasons why one might fear that a merger would facilitate collusion. Firstly, the merger might improve market transparency. For example. Secondly, the merger reduces the number of independent actors by one. In highly concentrated markets – where tacit collusion is a priori more likely – this can significantly reduce the difficulty of coordination, from « agreeing » on targets to monitoring the behaviour of rivals. Finally, it is generally believed that tacit coordination becomes easier if the parties are more symmetric in terms of costs, market shares, types of products and so on. The acquisition of a destabilising “maverick” can be seen as a special case of this symmetry argument. Is any of those three potential concerns more or less important in a digital context?

For traditional competition policy, the number of firms involved is one of the key factors affecting the likelihood of tacit collusion. More firms simply mean a greater need to monitor behaviour in a noisy environment. To the extent that « algorithmic collusion » is significantly more efficient than collusion in non-digital environments, one would think that larger numbers of firms can be accommodated more readily, decreasing the relevance of this factor for merger assessment. Of course, the same argument suggests that scrutiny for tacit collusion should be extended to less concentrated markets than is currently the case. This, however, is not merger-specific.

Symmetry matters mostly because symmetric firms are more likely to agree on a conduct and because they behave similarly, making the monitoring of rival behaviour easier. It is also true that, under some fairly general conditions, symmetry facilitates the design of incentive-compatible collusive schemes. Because algorithms – and especially AI-intensive algorithms – make it easier to implement and monitor rather complex tacit agreements, accommodating more diverse firms within the collusive group should be becoming easier, not harder. In turn, this means that the fact that a merger increases or decreases the overall symmetry of the sector should become less relevant when assessing how the merger affects the prospect for tacit collusion in a digital environment.

“Mavericks” are a special case of asymmetry. They are firms who, because of their product line, location, technology or simply « culture » tend to behave in a manner which is not conducive to tacit collusion. Clearly the acquisition of such a « maverick » should still raise eyebrows. Indeed, there are particular types of “digital” maverick which should be protected. This includes firms who have chosen not to hand their marketing/strategy to the type of algorithm that might facilitate collusion and those who use digital technology not to « play ball » but, on the contrary, to protect their customer relations (including prices and product offering) from prying digital eyes.

9.5.6. Conglomerate Mergers

As pointed out by Bourreau and De Streel (2019)²⁴⁷⁸, there are several factors which favour the emergence of conglomerates in at least part of the digital economy. On the supply side, there is the commonality of the skills needed to succeed in digital markets. Having hoarded large pools of digital talents, firms like Google or Facebook then find it profitable to expand in other markets where similar skills can be leveraged. On the demand side, consumers find “ecosystems” where the same firm supplies a number of seemingly unrelated products convenient and are therefore willing to pay a premium for products belonging to such an ecology. Some of the products available within an ecosystem might also be complements so that, in the absence of full interoperability across companies, consumers might be better off purchasing all “components” from the same seller. In turn, companies are eager to capture this premium. They might also be attracted by the fact that such “bundling” of unrelated products *can*, under some condition, lead to greater differentiation between suppliers and hence to softer competition.

The authors identify several mechanisms through which the emergence of digital conglomerates – and hence the approval of digital conglomerate mergers can affect competition adversely. Their goal is however different from us. Having – convincingly – argued that conglomerates are more likely to emerge in a digital world, they then proceed to discuss how competition policy might best deal with both conglomerate mergers and the type of anticompetitive conduct that a conglomerate structure might facilitate. By contrast our interest lies strictly with mergers with a specific focus on effects which arise, or are at least magnified *because of* the digital nature of the sectors considered. From this more restrictive perspective, it seems to us that the main specifically “digital” issue stems from the fact that similar sets of skills and assets allow companies to be innovative in a wide number of unrelated – or possibly complementary markets. While the modular nature of digital technology does put more emphasis on the creation of “ecologies” or “systems”, the issues raised by that trend are not new and do not, in our opinion, require new tools or a change in the practice of merger review. There might be room for greater emphasis on the development of industry-wide standards and a greater use of interoperability remedies, but these topics have already been widely considered by competition authorities over the last ten years and remain on their agenda.

As Bourreau and De Streel correctly argue, the similarity and fungibility of the skill sets across different digital markets, or even digital sectors, creates very large economies of scope. Within merger review, the magnitude of these economies of scope has consequences when identifying potential rivals as companies which operate in fields as distinct as social media, artificial intelligence/robotics and search can quickly end up competing, not only in new, emerging markets, but also, potentially at least, in the markets where they initially established a strong position. For example Alphabet/Google has moved into AI-driven robotics, Amazon is a leading supplier in the provision of cloud services, which one might reasonably have expected to be the province of companies

2478 Bourreau, M. and A. De Streel, 2019, “Digital Conglomerates and EU Competition Policy”, Working Paper, Telecom ParisTech and University of Namur.

like Microsoft, and companies as diverse as Apple, Facebook, Google and Amazon have entered – or considered entering – the market for electronic payments.

The consequences of this development for merger analysis are not obvious. On the one hand, common skill sets suggest that the negative effects of mergers, conglomerate or not, might be more readily kept in check by the threat of potential entry than in a non-digital environment. In a sense, this view would be consistent with the Commission's approach in *Dow-Dupont* where the notion of overlap in innovation markets was extended from the "overlap of product pipelines" which had long been considered in pharmaceutical mergers to overlap in the ability to develop similar products in the future. In this view though, as discussed in Régibeau and Rockett (2019), such overlap is only a concern if this development ability relies on resources which are in scarce supply or have been locked in by the merging parties. On the other hand, competition authorities should pay more attention to factors or deliberate strategies which might hamper this relatively free access to resources. For example, contractual clauses or "gentlemen's agreements" preventing poaching or draconian non-compete clauses can restrict the flow of necessary skills, especially when the relevant labour markets have a significant local dimension (e.g. Silicon Valley).

Prat and Valletti (2019)²⁴⁷⁹ provide an interestingly new perspective on mergers between digital platforms. Instead of defining the fields of activity of each platform in terms of the functionalities which it offers, the authors look at these platforms as "attention brokers", whose main goal is to attract users and get them to spend time in their respective "ecology". The more time spent, the more users are exposed to adds and to a variety of offers, both of which eventually yield revenues. Moreover, users generate data about their personal characteristics and shopping habits which can be used to better target advertising and/or can be sold to third parties.

The relevance of this new view for conglomerate mergers is that a platform's "market power" now depends on its ability to retain users within its own ecology and to use this to restrict the supply of advertising, leading to higher prices for both advertising and the corresponding products. This ability is increased by any acquisition which helps populate this ecology, whether or not there are any links of substitution or complementarity between the firm's initial products and those acquired through the merger. Traditional measures of concentration can therefore easily understate, or even miss entirely, this type of merger-specific increase in market power. In particular, the authors argue that appropriate measures of platform concentration can only be defined at the level of individual users, echoing some of the themes developed in sections 9.5.1 and 9.5.2 above.

9.5.7. Incentives to Abuse a Dominant Position and Merger Control

As previously discussed, it is entirely proper for merger review to assess whether the merger is likely to significantly increase the new entity's ability and incentives to engage in abuse of dominance. This is because ex post detection of anticompetitive conduct

2479 Pratt, A. and T. Valletti, 2019, "Attention Oligopolies", SSRN id3197930.

and the authority to enforce workable remedies ex post are both imperfect. This raises four questions: are digital sectors prone to be dominated by a single firm? Would the cost of enhancing such dominance through merger be particularly high? Is anticompetitive behaviour especially hard to detect or remedy in (some) digital sectors? Are there types of abuses which are more likely in digital sectors?

9.5.7.1. Dominance in Digital Sectors

The digital economy landscape features a number of very visible large companies, including Amazon, Apple, Facebook, Microsoft and Google, which are likely to hold a dominant position in at least one relevant market. However, this paints a misleading picture of dominance in the digital world. Referring back to Table 1, we see that the prevalence of dominance differs quite significantly across digital sectors. In telecommunication, for example, the growing importance of data has not led to dominance of mobile operators in national markets. Moreover, while the mobile OS market is essentially a global duopoly between IOS and Android, the mobile phone market itself is still rather competitive and has experienced noticeable changes in market shares, as shown in the following table. Robotic markets have not yet revealed any tendency to “tip” in favour of one or two firms either (see Table 9.4.).

Table 9.4. : Global Shares (Shipments) of Leading Smartphone Vendors

Company	Q2 2010	Q2 2012	Q2 2014	Q2 2016	Q2 2018
Apple	13%	16.6%	11.7%	11.7%	12.1%
Samsung	5.6%	32.2%	24.8%	22.7%	20.89%
Nokia	37.3%				
RIM	17.4%				
Huawei		4.1%	6.7%	9.3%	15.8%
Vivo				4.8%	
ZTE					
HTC	6.8%	4.1%			
LG		3.7%	4.9%		
Sony		4.5%			
Xiaomi			4.6%	3.9%	9.3%
Lenovo		3.1%	5.2%		
Oppo				6.6%	8.6%
Others	19.9%	28.6%	46.1%	41%	33.2%

Source : Statistica, <https://www.statista.com/statistics/271496/global-market-share-held-by-smartphone-vendors-since-4th-quarter-2009/>

By contrast, the positions of Amazon, Google and Facebook in their respective sectors are clearly very strong. Still, before we conclude that their respective activities are susceptible to dominance and draw conclusions for merger policy, we need to distinguish between the various mechanisms that lie behind the like continued success of these companies. The case of Facebook might be simplest as it benefited from an early mover advantage quickly cemented by large direct network effects. While such network effects

also arise outside of digital sectors, digital technology significantly accelerates the speed at which a significant “installed base” advantage can be built. One could of course argue that this speeds cuts both ways as it would also, in theory at least, allow a potential entrant to build her own base relatively quickly. However, once the leading firm already serves a large proportion of the relevant market then a rival can only take advantage of the potential speed of network building by inducing some customers to switch from the first mover. For a site like Facebook, where each individual builds large networks of friends, this would require a huge amount of coordination across a large number of consumers, which seems unlikely.²⁴⁸⁰ Digital social networks lend themselves to entrenched dominance. Moreover, this dominance does not rely on a better quality of service: Facebook can retain its position even if other social networks offered better functionality (e.g. better organisation of posts) or more attractive/effective data protection policies.

By contrast, both Amazon and Google owe the solidity of their current position to initial excellence reinforced by dynamic economies of scale. For Amazon, these economies of scale translate into an unequaled and self-reinforcing expertise in logistics. Google’s initial quality advantage has enabled the company to gather huge quantities of data about search behaviour which, in turn, makes it easier to keep improving the crucial search algorithm. In both cases then, the platforms remain dominant (partially at least) *because* they can offer a service of higher quality along some important dimensions. In principle then, such dominance could be challenged “on the merits” by developing one’s own logistic expertise, honing a better search algorithm or simply besting the incumbents on another dimension. The difficulty in challenging such dominance head-on stems from dynamic economies of scale: logistic expertise is subject to significant “learning by doing”, which cannot be replicated from scratch by potential entrants. Similarly, some experts²⁴⁸¹ argue that Google’s unmatched data on consumer searches makes it possible to produce more accurate results for “unusual” queries. Since such queries represent a significant share of most users’ searches, the resulting self-reinforcing competitive advantage matters.

Do such sources of dominance have any implications for abuse of dominance in the context of merger policy?

9.5.7.2. Privileged Remedies: Interoperability and Data Sharing

Because digital dominance is often based on some form of dynamic economies of scale, remedies favouring interoperability between suppliers/platforms and remedies involving some form of data sharing/access are likely to be the main tools to deal with merger-related concerns. In the case of social networks, for example, the increased installed base advantage of a merged entity could be remedied by making it easier for users to

2480 See J. Farrell & P. Klemperer, Coordination and Lock-in : Competition with Switching Costs and Network Effects, in Handbook of Industrial Organization, Vol. 3, R. Schmalensee, M. Armstrong, R.D. Willing and R.H. Porter Eds., (North Holland, 2007).

2481 Pratt, A. and T. Valletti, 2019, “Attention Oligopolies”, SSRN id3197930.

interact directly with users on other platforms and/or by measure facilitating the joint switch of users from one platform to the other. By contrast, a merger between search companies might call for giving access to their search data so that rivals can keep up with the pace of improvement of the merged entity's algorithm. Data-sharing could also be a remedy if two AI firms with proprietary "training" data sets would like to merge.

Because interoperability can provide a key check on dominance in digital sectors, policy measures aimed at further improving the transparency of the standard setting process and at streamlining the relationships between standard essential patent owners and users should be encouraged. In turn, such a strong standardisation environment would allow authorities to take a more relaxed approach toward some digital mergers, allowing for the realisation of more merger-specific efficiencies.

9.5.7.3. Abuse of Dominance: Detection and Remedies

Once dominance is established, "digital" companies are liable to deploy the whole panoply of conducts likely to protect them from merit-based competition. As seen on the previous review of cases, this includes tying, exclusivity clauses and foreclosure/raising rivals' costs through access degradation or constructive refusal to deal. In fact there does not seem to be any type of potentially problematic conducts which would be *less* likely because of the underlying digital technology.

On the other hand, we should expect digital players to be especially tempted by strategies which help them protect their specific source of dominance. For Amazon and Google, this would involve restricting rivals' ability to reach critical mass or to access the dominant platform's expertise or information. This suggests paying close attention to decisions affecting the supply of crucial inputs to rivals or making interoperability (and hence multi-homing) between digital platforms more difficult to achieve. For social network companies, strategies aimed at making switching or multi-homing harder should also be scrutinised. Finally, as discussed in the section on data, robotics and AI companies might have incentives to restrict access to the information required to "train" a particular type of algorithm.

In this chapter, however, the accent is not on the possibly changing face of abuse of dominance in a digital world. The relevant question is whether digitalisation increases the likelihood that mergers might facilitate unchecked abuses of dominance. In our current view, this raises three main issues.

The first issue is the magnitude and overall shape of the dynamic economies of scale discussed above. Google appears to have a material advantage due to its larger user base and the information that this generates. But of large is the "slope" of this effect at the scale at which Google and its rivals currently operate? Would a given acquisition significantly further Google's advantage? Would keeping the target out of rivals' hands prevent them from catching up significantly?²⁴⁸² Similar questions would apply to the

²⁴⁸² The point here is not that a merger could generate an "efficiency offence", whatever this means. There are two legitimate sources of concern. The first one is that dominance itself limits the passing of efficiency gain to customers while

logistics advantage of sales platforms like Amazon as well as to developers of robotics/AI-based products. While these questions are not typical of the digital world, the digital world still stands out in that we have little empirical knowledge as to the marginal magnitude of such effects.

The second issue is whether post-mergers abuses of dominance are more difficult to detect or establish in some digital sectors. As we discussed in section 9.3., many digital sectors rely on various forms of algorithms. Those algorithms are closely held secrets. Moreover some of these algorithms are constantly updated and are so complex that they are hardly transparent even to specialists. Such issues have already emerged in specific cases, including the Google “shopping” case where determining whether or not the changes in Google’s general search algorithm resulting in the downgrading of shopping sites was justified by user preferences or was part of a foreclosure strategy proved to be hard.

This lack of transparency is compounded when firms rely on “learning” algorithms which change depending on the feedback they receive: not knowing what this feedback might be one simply cannot predict how such algorithms will evolve. Hence, to the extent that potentially abusive strategies might be implemented through algorithms, detecting such abuses and documenting them up to the usual standard of proof might be difficult. This suggests that, in such digital sectors, competition authorities should be more willing to block mergers which seem likely to increase the parties’ incentives and ability to foreclose rivals or to pursue other types of anti-competitive strategies.

A similar argument can be made with respect to remedies. In some digital sectors, finding robust remedies against abuses of dominance can be an arduous task. Consider, for example, the case of hotel booking platforms. The competition authorities of France, Italy and Sweden decided that Bookings should remove from its contracts any clause requiring hotels to give it room prices which are no lower than the lowest price found on other intermediaries. However, these authorities had to be aware of the fact that Bookings could, in principle, respond to such a ruling by changing its search algorithm in a manner that favours hotels granting them a low price. Most obviously, Bookings could search other sites and simply penalise any hotels charging lower price elsewhere. More subtly, Bookings could enhance the link between ranking and the actual number of bookings received from this hotel, or it could link the search ranking to the discrepancy between clicks and actual bookings. Clearly then, it is hard to design an effective remedy without a very intrusive – and frequently repeated – examination of the search algorithm, which is at the very core of hotel booking businesses. The continuing saga of the appropriate remedies in Google’s “android” cases offers further evidence that designing effective remedies for algorithm-based companies is not for the faint hearted. Accordingly, anticipating such difficulties, competition authorities could reasonably decide to conduct tougher merger reviews in this type of sector.

increased dominance makes abuse of dominance more likely. If abuses are difficult to catch, the balance can tip toward this second effect. The second point is that, in concentrated industries, there can be pre-emption incentives in the sense that a dominant firm would outbid a rival or potential entrant even though the efficiency gains from acquiring the target are larger for those rivals.

9.6. Conclusion and recommendations

Many 'new developments' in competition policy are overhyped leading to calls for revolutions or new paradigms when relatively small changes in practice are often all that is needed to deal effectively with the modified environment. Examples of such tempests in a tea cup include 'network effects', 'winner takes all (or most)' markets and, though to a lesser extent, the purported emergence of 'platform competition'. While the development of the digital economy does not either call for a revolution in how we conduct competition policy, it is likely to require some significant changes in competition guidelines and will require close coordination between competition authorities and other regulatory agencies. While this chapter deals with merger review, this overall conclusion applies also to competition policy as a whole.

The main characteristics of digital technologies are algorithms, data, bridging of distance and speed. These characteristics have a number of important consequences. Algorithms are difficult to fully grasp and even harder to police. This makes the detection of abusive conduct and the implementation of effective remedies harder. Stepping back, then, this might justify a tougher line for mergers which are likely to facilitate such abusive conducts. On the other hand, in our view at least, the purported effect of algorithms on companies' ability to implicitly collude does not have strong implications for merger policy, except maybe for having a closer look at mergers in somewhat less concentrated markets: if collusion is easier then the level of concentration at which it becomes feasible is also lower.

The bridging of distances has obvious implications for market definition when the merging parties take orders *and* deliver products online. A more subtle analysis is required when parties take orders online but still deliver goods or services physically. The relevant notion of "speed" is not speed of innovation. While many digital sectors are currently characterised by fast-paced innovation, there is nothing intrinsically "digital" to this trend. By contrast, it is because digital technology is fast (and spans distances) that network effects can arise much faster than in other sectors. This underlines the need for forward looking merger review and the possibility of using access/interoperability remedies.

The combination of algorithms and data has allowed unprecedented targeting of advertising to online consumers as well as a tailoring of the offers (including prices) received by each individual. This poses a serious challenge to our usual economic analysis of horizontal effects as well as to our traditional approach to market definition. In a very real sense, every individual becomes a "relevant" market, challenging traditional SSNIP tests and "market share-based" approaches to market power. Moreover, in such an environment, the effects of a merger depend not only on the overlap between the customers served by each party but also on the amount and type of information that each party has about those customers. Unfortunately, economic analysis of competition in such settings, while already useful, is not yet mature.

Finally, while the role of data in digital competition is undeniable, we currently lack the information required to derive broad principles as to how data should be considered in merger review. The main problem is that, for a merger, it is mostly the *marginal* return to data which matters: would the combination of the data held by the two parties significantly raise barriers to entry? Would it generate significant merger-specific efficiencies? There is simply no publicly available information to allow us to at least establish some presumptions in the matter. We are therefore back to the “one case at a time until we learn enough” approach.

Chapter 10: Case Study: Standard setting, Internet of Things and Industry 4.0.

Igor Nikolic, Ioannis Lianos, Bjorn Lundqvist with BRICS teams

10.1. Introduction

This chapter will look into the future developments with the advancement of 5G standard and the Internet of Things. We are increasingly seeing various objects connected to the internet and the potential emergence of self-driving cars, connected domestic appliances, smart health devices and even smart cities. However, new technologies will bring new challenges. The aim of this chapter is to examine some potential legal problems with rapid implementation of Internet of Things and new technological solutions.

The structure is the following. The first part of the chapter will explain what IoT is and what benefits it will bring, with special focus on the recent development in BRICS countries. Next, the chapter will explain how the IoT ecosystem works, and how it encompasses a large number of technological standards. Generally, we can observe ‘infrastructure’ standards that read on physical objects that enable connectivity between them (such as 5G and Wi-Fi standards), and ‘upper layer’ standards that concern data acquired by IoT objects. In order for IoT ecosystem to work efficiently we would need to have seamless connectivity between different IoT object, and thus ubiquitous access and use of infrastructure standards, as well as access to data generated by different objects. For example, self-driving cars would all need to use 5G and other infrastructure standards and would need to share driving data between them. However, the successful implementation of infrastructure and upper layer standards can pose different challenges. Namely, patents that read on infostructure standards would need to be widely available and licensed. Standard essential patents are generally required to be licensed on fair, reasonable and non-discriminatory (FRAND) terms, but what exactly those terms are is subject to diverging interpretations. Sharing of data represents further challenges, as there is currently no widely used legal basis or instrument to compel sharing, which also opens a data privacy concerns. The approaches taken in the EU and the US will be compared with nascent practice in BRICS countries.

10.2. Introduction to IoT and Industry 4.0

The concept of Internet of Things (IoT) dates back to the year 1999. The term ‘Internet of Things’ was coined by British technology developer Kevin Ashton during his work at Procter & Gamble,²⁴⁸³ an American consumer goods corporation. It is a phenomenon in which physical entities (things, animals, and humans) are made to function “smartly” by

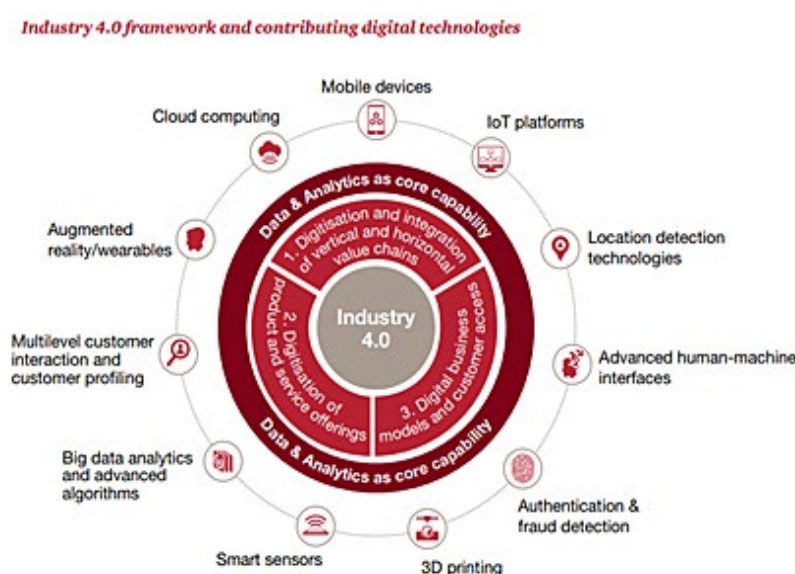

²⁴⁸³ Kevin Ashton is a British technology pioneer who cofounded the Auto-ID Center at the Massachusetts Institute of Technology, which created a global standard system for RFID and other sensors.

connecting them to sensors. These sensors detect any electrical or optical impulse and convert it to a physical parameter which is quantifiable into units. For instance: sensors can identify an electrical impulse and can quantify it as temperature, body pressure, atmospheric pressure, speed and moisture, among others. It is the ability of these sensors to transfer data over the network with the help of internet and without any human or machine intervention that is called the IoT. Devices such as connected (smart) cars, smart cities, smart meters, and smart home are few of the many applications of the IoT.

Considering that the IoT can be implemented to any object of everyday life, it has the potential to trigger mass production of IoT devices, thus giving rise to an industrial revolution. As the first industrial revolution began with the introduction of the steam engine, the second by bringing assembly line mass production, the third through the establishment of automation via electronic systems, the one with the IoT is the fourth one. It is now known as the Industry 4.0.

The scope of the Industry 4.0 is to implement smart connected devices in a system in which the smaller connected units collectively form a 'smart' and 'connected' enterprise going higher up the scale. According to a paper published by Schneider Electric SE (an MNC based in France) in the year 2017, the vision of the Industrial IoT is defined as "The IIoT vision of the world is one where smart connected assets (the things) operate as part of a larger system or systems of systems that make up the smart manufacturing enterprise. The "things" possess varying levels of intelligent functionality, ranging from simple sensing and actuating, to control, optimization and full autonomous operation".²⁴⁸⁴

Picture 10.1: Industry 4.0 framework and contributing digital technologies²⁴⁸⁵

²⁴⁸⁵ PWC, 'Industry 4.0: Building the digital enterprise' (2016), available at: <<https://www.pwc.com/gx/en/industries/industries-4.0/landing-page/industry-4.0-building-your-digital-enterprise-april-2016.pdf>>.

10.2.1. Level of Development of IIoT

The IIoT has seen multi-faceted development in terms of IoT adoption, market size, investment and profitability. According to *Forbes*: "discrete manufacturing, transportation & logistics and utilities industries are projected to spend \$40 billion each on IoT platforms, systems, and services."²⁴⁸⁶ McKinsey has predicted that the IoT markets will be worth \$581B for ICT –based spend alone by 2020, growing at a compound annual growth rate (CAGR) between 7 and 15%.²⁴⁸⁷ The IIoT market is predicted to reach \$123B in 2021, attaining a CAGR of 7.3% through 2020.²⁴⁸⁸ Smart Cities (23%), Connected Industry (17%) and Connected Buildings (12%) are the top three IoT projects in progress. IoT Analytics found that nearly half of the Smart City projects (45%) are in Europe, while the Americas lead in the area of Connected Health, with 55% of global projects today. The Americas are leading the world in Connected Car IoT projects as well, with 54% of them worldwide.²⁴⁸⁹

The following graphs depict a clearer picture of the development of IIoT worldwide. The first graph portrays the market impact of IIoT, with volume reaching \$110 billion by 2020. The second graph shows the sector-wise growth of IIoT. Clearly Smart Cities have taken the biggest share (23%) of the market.

Picture 10.3: Global share of IoT applications²⁴⁹¹

10.2.1.1. India

The vision for the IoT development in India is to develop connected, secure and smart IoT-based system for its economy, society, environment and global needs. The IoT market in India is expected to grow significantly. India intends to create an IoT industry of \$15 billion by 2020 which will lead to a surge in the number of connected devices from around 200 million to over 2.7 billion by 2020. Gartner has predicted that the revenue generated would be \$300 billion.²⁴⁹²

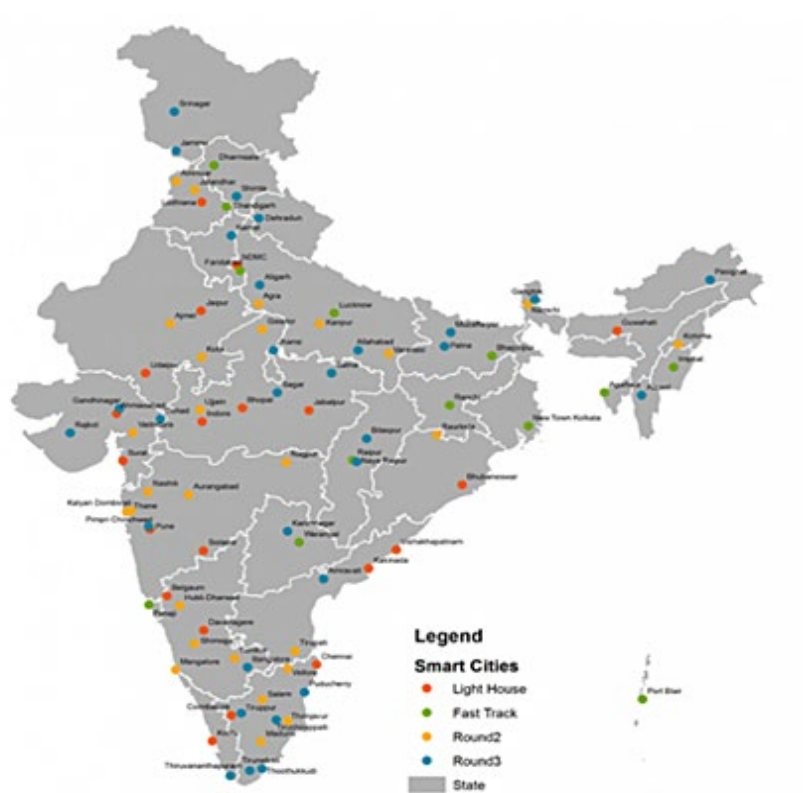

Apart from individual smart solutions, it is the 'Smart Cities' Mission launched by the Government of India that has become one of the biggest IoT use case.²⁴⁹³ The government of India has planned 100 smart cities across the country which involves massive expansion of the IoT. The implementation of smart solution is also seen as a driver for economic growth and improved living conditions for the citizens of India. As per the data from 'Smart City Mission' website, a population of 99,630,069 is estimated to benefit by the mission.²⁴⁹⁴ The following map depicts the distribution of all the cities that will be equipped with smart solutions in a phase-wise plan:

2491 IoT Analytics, 'The Top 10 IoT Segments in 2018 – based on 1,600 real IoT projects' (2018) available at: <https://iot-analytics.com/top-10-iot-segments-2018-real-iot-projects/>

2492 Department of Electronics & Information Technology, Government of India, 'Draft Policy on Internet of Things' (2015) <https://www.mygov.in/sites/default/files/master_image/Revised-Draft-IoT-Policy-2.pdf>.

2493 Smart City Mission, is an urban renewal and retrofitting program by the Government of India with the mission to develop 100 cities across the country making them citizen friendly and sustainable.

2494 'Smart Cities Mission' (Smartnet) <<https://smartnet.niua.org/smart-cities-network>>.

*Picture 10.4: smart cities in India*²⁴⁹⁵

The IoT in India is expected to provide automation solutions for various domains such as health, security, agriculture, automobile disaster management and recovery, traffic management and others. These implementation domains are chosen by keeping in mind the objective of the 'Smart City Mission' to provide an enhanced quality of life, core infrastructure and clean and sustainable environment. Some of the key aspects of Smart Cities would be Smart Parking, Water Management, Smart Grid, Waste Management, Automated Transport System, and Urban Planning.²⁴⁹⁶

10.2.1.2. China

With the global unified standard set to be finalized by the end of 2019, China will commercially launch 5G, becoming one of the first 5G-ready markets in the world. China is determined to make 5G a top priority on its national agenda and to take a leadership role globally. Targeting for a commercial launch in 2020, China aims to secure the perks of timely involvement, building the industry infrastructure and initiating research and application of 5G-related technologies. China is determined to be an early bird in the field of 5G and technology. China's Ministry of Industry and Information Technology (MIIT),²⁴⁹⁷

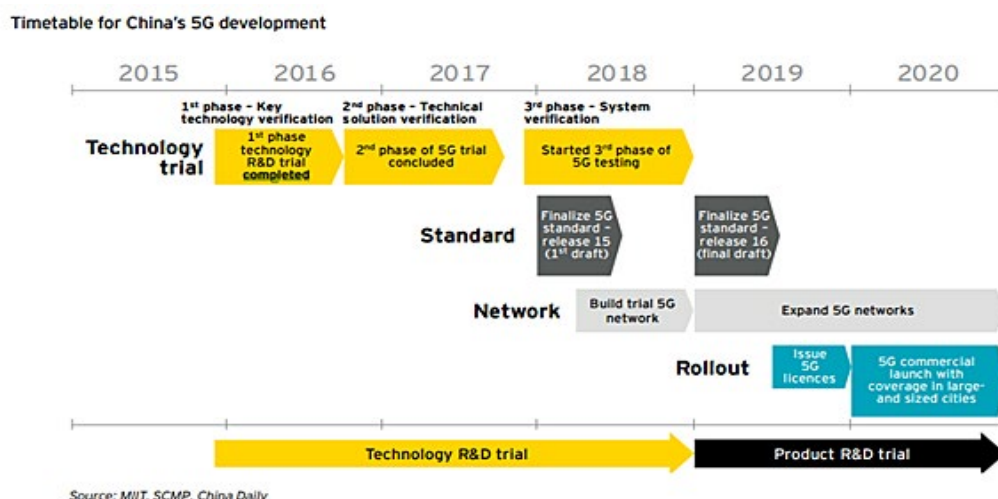

²⁴⁹⁵ Nurfilzah Rohaidi, 'Inside India's \$7.5bn Smart City Challenge' (Govinsider, 9 November 2017) <<https://govinsider.asia/smart-gov/jagan-shah-niua-india-100-smart-cities/>>.

²⁴⁹⁷ See <http://www.miit.gov.cn/>

National Development and Reform Commission (NDRC),²⁴⁹⁸ and the Ministry of Science and Technology (MOST),²⁴⁹⁹ jointly founded the IMT-2020 (5G) Promotion Group to expedite the formulation of 5G standard in cooperation with other nations in 2013.²⁵⁰⁰ The Government of China has also laid down policies under its 13th Five-Year Plan and the Made in China 2025 plan to support research and development and attempts for commercialization of 5G in 2020 at national levels. Below is the timeline which China is following for 5G development:

Picture 10.5: Timetable for China's 5G development²⁵⁰¹

As far as investment and revenue are concerned, increasing the equipment supply will reduce the unit cost and encourage the implementation 5G. As demand for 5G services improves, it will see a rise in the sale of equipment as well as implementation infrastructure such as application development. As a result, Chinese operators have already announced plans to invest in 5G network deployment from 2019. Chinese telecom operators have also seen an increase in 5G innovation centers. As per the timeline above, China was already in its third phase of testing in 2018 both on off the field. In fact, EY expects China's 5G capex will amount to RMB1.5 trillion (\$223 billion) between 2019 and 2025.²⁵⁰² China is all set to benefit from the first movers' advantage. It can expect to gain substantial paybacks from its advanced digital capabilities and higher levels of investment. As per a PwC report," they (economies with first mover's advantage) are far more likely to be forecasting both revenue gains of more than 30% and cost reduction of more than 30% at the same time. They're more likely to expect efficiency gains too."²⁵⁰³

2498 The National Development and Reform Commission of the People's Republic of China is an agency under the Chinese State Council which looks after the macroeconomic management of the State. It also has administrative and planning control over the Chinese economy.

2499 The Ministry of Science and Technology of the People's Republic of China is the central government ministry which coordinates science and technology activities in the country.

Picture 10.6: 5G capital expenditure forecast in China²⁵⁰⁴

China's key to drive a fully functional 5G technology is that it is also focusing on the adoption of the 5G compatible terminal devices. To fully utilize the many benefits of 5G, devices with supporting technology are required. While the fully compatible 5G devices can only be produced in abundance once the 5G standards are out, China is fixing the deals with chipmakers so as to roll-out the devices in 2019.²⁵⁰⁵

While China anticipates more than 1.7 billion public M2M (machine-to-machine) connections by 2020,²⁵⁰⁶ it aims to be among the first leaders and launchers of 5G and its applications. The telecom policies of China, the government's initiatives focus on building terminal devices, setting up innovation centers and R&D wings for 5G, and its contributions to the development of standards will definitely make China one of the leading nations of 5G development not only among BRICS countries but globally.

10.2.1.3. Russia

Like India and China, Russia strives to become an IoT smart nation. According to the economic and social policy of the Russian government, industrial IoT is considered as one of the "end-to-end technologies" necessary for the digital transformation of economy and society.²⁵⁰⁷ The World Bank's Russia Digital Economy Report emphasizes a sufficiently high level of digital infrastructure in Russia, which should be used "to introduce emerg-

[tries-4.0/landing-page/industry-4.0-building-your-digital-enterprise-april-2016.pdf](https://www.ey.com/Publication/vwLUAssets/ey-china-is-poised-to-win-the-5g-race-en/$FILE/ey-china-is-poised-to-win-the-5g-race-en.pdf)

2505 Ibid

2506 Ibid, 24.

2507 A list of the "end-to-end technologies" was first set out in the programme "Digital Economy of the Russian Federation" approved by the Government of the Russian Federation Resolution No. 1632-r dated July 28, 2017. The list includes, in addition to industrial IoT, other technologies: big data, neurotechnology and artificial intelligence, distributed register-based technologies, quantum technologies, new production technologies, robotics components and sensorics, wireless technology, virtual and augmented reality technologies. In 2019 the programme "Digital Economy of the Russian Federation" was replaced by the National Programme "Digital Economy of the Russian Federation", which applies the same concept of "end-to-end technologies".

ing technologies, including the IoT”.²⁵⁰⁸ The report observes that an advanced digital infrastructure, which is already in place in Russia, should be used, *inter alia*, to deploy 5G mobile networks and to introduce emerging technologies, including the IoT.²⁵⁰⁹

The National Programme “Digital Economy of the Russian Federation” for 2018 – 2024 (National Programme) defines several measures related to the IoT, such as infrastructure development, improvement of standardization mechanisms, as well as promotion of the development and implementation of “end-to-end technologies”. Thus, the Federal Project “Information Infrastructure” forming a part of the National Programme provides for the adoption of the policy framework for the construction of narrow-band wireless IoT networks and 5G networks deployment. The regulator is expected to select the frequency bands suitable for 5G by the end of 2019. By 2020 the relevant public authority should approve the action plan for releasing frequencies for 5G. Moreover, 5G pilot projects in five different industries shall be completed in 2020.²⁵¹⁰

In recent years, the major national telecom operators have initiated a number of 5G mobile network development projects.²⁵¹¹ However, the successful countrywide 5G implementation requires strategic planning and active participation of the state. The National Programme is aimed at creating the regulatory framework and supporting system to accelerate the development of 5G technologies and new 5G-based services. GSMA forecast for 5G adoption in Russia suggests that the first commercial deployments will take place in 2020, and the total 5G base will reach 46 million with the population coverage of 60% by 2025.²⁵¹²

In the view of the importance of standardization for digital economy, Russia has already modernized its standardization system and strives to take a more active role in international standards development.²⁵¹³ In 2017, the Federal Agency for Technical Regulation and Metrology (Rosstandart) established a special Technical Committee No. 194 “Cyber-Physical Systems” to develop national standards and to ensure the involvement of Russian experts in the international standardization activities. In 2019, Rosstandart adopted the first national standard for IoT,²⁵¹⁴ and the Technical Committee opened a procedure for public consultation of two draft standards. Russia is working on the adaptation of

2511 The most significant 5G trials were conducted during the 2018 FIFA World Cup, where major mobile operators in Russia MTS and MegaFon tested several 5G pilot zones. Early in 2019 Postelecom and Megafon have established a joint venture company to develop 5G network infrastructure; MTS signed an agreement with Ericsson on 5G Russia roadmap for 2019-2022 and a deal with Chinese company Huawei to further develop 5G technology in Russia.

2512 GSMA, ‘5G in Russia: a local and global view on the way forward’ (2019) p.19.

2513 Law No. 162-FZ “About standardization in the Russian Federation” entered into force in July 2016. The law establishes the legal framework of developing and setting out national standards.

2514 PNST 354-2019 Information technology. Internet of things. Wireless data transmission protocol based on narrowband modulation.

international standards for IoT and on the harmonization of the existing national standards with the international standards.²⁵¹⁵

The development of industrial IoT has been particularly successful in Russia. According to a survey, mining and processing industries are the pioneers in deployment of IoT, with high-tech industry still lagging.²⁵¹⁶ The progress in the implementation of IoT in specific industries reflects the structure of the Russian economy as resource based. The respondents interpret the emerging trend as a big opportunity for country's specialization in the global IoT market.²⁵¹⁷

Russia has also made good progress in the development of unmanned vehicles. The state supports the private sector and research institutions in their initiatives in this new area. In 2018, the Government of the Russian Federation issued a regulation that permits testing of driverless cars on regular roads of Moscow and the Republic of Tatarstan.²⁵¹⁸ The testing will be conducted between December 1, 2018 to March 1, 2022 and will involve automated trucks (KamAZ), automated tractors and other agricultural machinery (Avrora LLC), buses and cars (Yandex). There are examples of positive dynamics in the development of smart cities, as well as telemedicine. Numerous projects have been initiated by the government or have been carried out through public-private partnership model.

To summarize, the government in Russia plays a key role in regulating and supporting digital technologies, including the IoT. The choice of a centralized model seems justified largely due to institutional and territorial specificity, as well as country's political history. On the other hand, the study published by United Nations Development Programme in 2018 shows that the policy framework for the digital economy varies significantly and provides examples of both bottom-up and top-down approaches adopted by the countries with the similar level of economic and social development.²⁵¹⁹ It is worth noting that recent studies have repeatedly emphasized the vital role of the government in strategic

2515 In 2019 ISO/IEC 29161:2016 "Information technology — Data structure — Unique identification for the Internet of Things" was adopted as national standard GOST R ISO / IEC 29161-2019 "Information technology. Data structure. Unique Identification for the Internet of Things". Another four standards for IoT should be adopted by the end of 2020: GOST R "Internet of Things. Reference Architecture" (harmonization with ISO / IEC 30141); GOST R "Internet of Things. Terms and definitions" (harmonization with ISO / IEC 20924); GOST R "Internet of Things. Interoperability of the" Internet of Things "systems. Part 1. Structure" (harmonization with ISO / IEC 21823-1); GOST R "Internet of Things. Interoperability of the Internet of Things". Part X. Semantic interoperability "(harmonization with ISO / IEC 21823-X). Towards Policy Frameworks in The Asia-Pacific' (2018) p.25. <https://www.undp.org/content/dam/undp/library/capacity-development/English/Singapore%20Centre/FramingPolicies_DigitalEconomy_2018_NUS-UNDP.pdf>.

planning and coordination of digital transformation. Thus, the final synthesis report “Going Digital: Shaping Policies, Improving Lives”, closing the two-year Going Digital Project conducted by OECD, points out the responsibility of the state for the development of comprehensive digital transformation strategy and the effective co-ordination among all stakeholders.²⁵²⁰ According to the report of PwC Russia: “the government must play a vital part in this process, as it has the capacity to improve the regulatory framework, develop IoT support devices, create a stimulating environment to develop human capital and promote Russian best practices abroad. By taking a systems approach, the Internet of Things could become an economic game changer for Russia in the long term.”²⁵²¹ Although Russia implements the top-down approach, the government seeks to minimize the risks of overregulation by encouraging business participation in lawmaking and developing a more flexible regulatory policy in the field of IoT and other digital technologies.

10.2.1.4. Brazil

Brazil is a BRICS nation that is growing at par with developed nations as far as the IoT and 5G are concerned. The Brazilian government has outlined the main obstacles to develop the IoT ecosystem and is now working on the implementation of this new technology.²⁵²² The government is also actively working on the implementation of 5G technology. Meanwhile, new R&D centers have already been installed to develop these technologies further. IBM started an open innovation platform to develop further research in the field of agriculture called IBM AgriTech.²⁵²³

The Brazilian government has recently presented a technical, participatory and multisectoral study,²⁵²⁴ outlining the local technological and economic challenges, as well as how to address legal issues inherent to the development of IoT in Brazil. It aimed to contribute to the development of a strategic action plan, called the National Plan for the Internet of Things.

The study divided the legal analysis into two main stages. First, it evaluated horizontal regulatory issues that affect any sector that benefits from the implementation of IoT. In this step, the study identified a need to reconsider certain aspects of Brazilian legislation and reorganize institutional arrangements.

2523 Rens Koele and Petra Smits, ‘IoT and Networking Technology in Brazil: Innovation in Agriculture, opportunities in Health and Industry’ (2018) Netherlands Enterprise Agency, available at: <<https://www.rvo.nl/sites/default/files/2018/05/iot-and-networking-technology-in-brazil.pdf>>.

2524 For more information about the study, and to access its full version, please see: <<https://www.bndes.gov.br/wps/portal/site/home/conhecimento/pesquisaedados/estudos/estudo-internet-das-coisas-iot/estudo-internet-das-coisas-um-plano-de-acao-para-o-brasil>>

Among others, the study considered that the following challenges should be addressed: (i) possible changes in telecommunications regulation; (ii) the establishment of rules and institutions to deal with information security challenges; (iii) the creation of legislation for the protection of personal data by private initiative and the government, as well as (iv) taxation matters and other issues related to import and customs clearance. In the second stage, an in-depth study was carried out considering specific sectors that would greatly benefit from the implementation of IoT. The core verticals of the study were Smart Cities, Healthcare, and AgriTech.

After the study presentation, the Ministry of Science, Technology, Innovation, and Communication (MCTIC),²⁵²⁵ and the Brazilian Development Bank (BNDES)²⁵²⁶ announced a set of initiatives to develop and accelerate the adoption of IoT in the country. In order to stimulate business and attract investments based on technologies related to IoT, as well as to introduce some incentives, Brazilian Government is preparing a Decree to implement the National Plan for the Internet of Things. The expectation is that the Government will enact this Decree shortly. The plan will define which actions should be taken to create a sustainable IoT ecosystem. The government focuses on promoting innovation, developing human capital, defining regulation, and improving connectivity. It is expected that by 2025, Brazil could contribute \$4-11 trillion to the global economy.

In order to create a thriving ecosystem for IoT services to develop seamlessly, Brazil engaged possible stakeholders, which included IoT chambers, technical partners, leadership teams, funding agencies. Along with written inputs from public and private sectors, Brazil carried out thematic workshops that engaged specialists and stakeholders to have a better understanding of all kinds of requirements. Since the publishing of the study, BNDES has launched several bids aimed at supporting projects consistent in the implementation of IoT in the prioritized sectors, especially Smart Cities and AgriTech, and in the Industry.

On the other hand, the development of 5G in Brazil started in February 2017, when representatives of the industry, government, and research institutions gathered to launch the initiative “Projeto 5G Brasil”.²⁵²⁷ The project aims at building an ecosystem to drive 5G forward in Brazil. This initiative empowered Brazil to contribute and participate in international discussions and become part of decision-makers that will set standards for 5G. The nation expects to make use of the 5G network to implement IoT as a sustainable tool for its society so that that it enhances the quality of life of Brazilians and economy is strengthened.

2525 The Ministry of Science, Technology, Innovation and Communication of Brazil is the civilian cabinet organization which coordinates science, technology, and innovation activities in the country

2526 The Brazilian Development Bank (BNDES) is the main financing agent for development in Brazil founded in 1952.

2527 To see more about “Projeto 5G Brasil”, please see: <<http://5gbrasil.telebrasil.org.br/>>.

Recently, the National Telecommunications Agency (ANATEL) defined the radiofrequency in which the 5G technology will be rolled out (2.3GHz,²⁵²⁸ and 3.5GHz²⁵²⁹).²⁵³⁰ The expectation is that the bidding for these radiofrequencies will occur until March 2020. It is evident that Brazil has embraced 5G and IoT with open arms and is all geared up to implement it in the day-to-day life of Brazilian citizens.

10.2.1.5. South Africa

The IoT will become the medium to bring in inventive solutions to meet the socio-economic challenges in South Africa. It is expected to transform businesses to enable better growth and increased revenue in South Africa. Smart City solutions, such as using the IoT to curb the problem of scarcity of water in informal settlements to intelligent transport solutions, are increasingly being studied to find solutions for better urbanization. In agriculture, companies have deployed IoT devices to analyze weather patterns. To make the expected change a reality, regulatory authorities, mobile operators and other stakeholders will need to collaborate to work together towards a common goal.

In South Africa, water scarcity has become a serious concern. It has become a critical resource, and this is apparent from the recent severe water shortages that were experienced by the City of Cape Town. Thus, the use case of monitoring of the water collection at the storage units and the detection of water leaks in the supply pipeline network through smart sensor networks and smart metering has become a critical 5G and IoT use case in the urban settlements of South Africa. The population of South Africa has grown from 37.8 million to 55 million between 1993 and 2016 and in that time, household numbers increased exponentially.²⁵³¹ In this case, Smart water meters are the best IoT solution that can resolve the water scarcity problem.

Policy and regulatory holdups that restrain operators and potential stakeholders from actively and keenly responding to the changing nature of communication require policy and regulatory consideration. South Africa needs to make policy changes and create a conducive environment to attract long-term investment and IoT business to flourish. However, the South African National Integrated ICT Policy Whitepaper published in 2016 has identified three major challenges that can result in slow network rollout in South Africa.²⁵³² They are:

2528 Anatel's regulation for 2.3 GHz radiofrequency can be seen: <https://sei.anatel.gov.br/sei/modulos/pesquisa/md_pesq_documento_consulta_externa.php?eEP-wqk1skrd8hSlk5Z3rN4EVg9uLjqrLYJw_9INcO7DJ9WCixRwgICrwOIVnuVfsThFdWW-I_CHL4OiZ_Qmp4J0NboOw5gmi8wDxqZWaLW5rxp3ly8CUmouteUoWxej>

2529 Anatel's regulation for 3.5 GHz radiofrequency can be seen: <https://sei.anatel.gov.br/sei/modulos/pesquisa/md_pesq_documento_consulta_externa.php?eEP-wqk1skrd8hSlk5Z3rN4EVg9uLjqrLYJw_9INcO67HDZ-7d1LUfLp4CpC5Sfjq-MxDm2BS2Buyb-GNebRRjOA6CkZVUaLBltCMGAjYJP-TTXaUXa-RgMvonsBg2u1>

2530 Anatel decided about the radiofrequency usage in a meeting occurred on May 23rd, 2019. For more information: <http://www.anatel.gov.br/institucional/ultimas-noticiass/2278-aprovada-destinacao-de-faixas-de-frequencias-de-2-3-ghz-e-3-5-ghz>

2531 'Making 5G a reality for Africa: A CSIR & Ericsson Collaboration' (Ericsson, 2018) <<https://www.ericsson.com/assets/local/press-releases/africa/2018/5g-africa-report-11-2018.pdf>>.

2532 Department of Telecommunications & Postal Services, Republic of South Africa, National Integrated ICT Policy (White

- **An ineffective regulatory regime:** An instance of ineffective regulatory regime as cited in the South African National Integrated ICT Policy Whitepaper is that the Electronics Communication Act is rigid in nature as far as market reviews are concerned. Moreover, the competition enquiries are not properly conducted which leads to ineffective regulations.
- **A concentrated broadband infrastructure market:** Again, the problem as identified is a lack of IT infrastructure in underdeveloped areas, high cost of communication and inefficient use of the frequency spectrum lead to a compromise for both innovation and quality of service.
- **High prices for communication:** The replication of infrastructure and commercially driven plans lead to expensive infrastructure deployment, the costs of which are borne by the ultimate consumer. Moreover, the inadequate number of service providers are not able to regulate the retail prices.

Unless these problems are eradicated, the digital divide will widen in South Africa, its ability to meet its broadband targets will be undermined and the country may miss the opportunity provided by broadband to improve its economy.

10.2.2. Areas in which IoT and Industry 5.0 are deployed

By now it is clear that IoT and Industry 4.0 have its implications in every walk of life. With the rolling out of 5G in the near future, the vision of smart cities seems to be a possibility. 5G has enough potential and characteristics to make smart cities a reality. It is only through 5G, millions of devices can be connected at the same time where they can communicate with each other as well as over the network with high speed.

It is the realization of smart cities that IoT can lead to an industrial revolution. With smart cities, devices will be deployed at a revolutionary scale. Few of the unlimited use cases of IoT are in the domains of education, health, security, defense, traffic management, city cleaning, automobile, home safety, geo tracking, weather forecasting, smart meters, asset tracking, inventory management and geo fencing.

These are only a few of many use cases of IIoT. The versatility of applicability is evident from the possible deployments mentioned above. It is important to note that IoT use cases will continue to expand in the coming years.

10.2.2.1. Terminal devices

It is obvious from the above sections that 5G will give a boost to IoT technology which, in turn, will lead to the IIoT. All of it will require terminal devices that are capable of hosting this new technology. Connected devices are part of a system where all devices are capable of talking to other related devices as well as communicate relevant data released

Paper, 28 September 2016) <https://www.dtps.gov.za/images/phocagallery/Popular_Topic_Pictures/National_Integrated_ICT_Policy_White.pdf>.

by sensors to users, businesses and other interested parties over network.

The terminal IoT devices can be categorized as consumer, enterprise, and industrial. Consumer IoT devices include smart TVs, smart speakers, wearables and other smart equipment whereas smart meters, commercially deployed security systems and smart city technologies -- such as traffic monitors and weather forecast devices -- are examples of industrial and enterprise IoT devices. Other technologies, including smart air-conditioning, smart thermostats, smart lighting, and smart security have enterprise and industrial uses.

The terminal devices are not just limited to mobile phones; they can be intelligent machines, drones, robots, intelligent devices like smart meters, smart bins, smart traffic lights, and the list goes on. The adaptability and versatility of the use cases of Industry IoT is such that the terminal devices can range from something as simple as a trash bin to a high-end car.

10.2.2.2. Communication Infrastructure

The IIoT infrastructure is different from infrastructure for the enterprise or consumer IoT. IIoT is the amalgamation of information technology (IT) and operational technology (OT).²⁵³³ Some important infrastructure requirements can be categorized as follows:

- **Network Requirements:** network requirements can vary based on the application. They could range from being very basic to extremely demanding. Some applications require low latency and high throughput whereas others can afford low power consumption and high latency. The system should be capable of adjusting with the varying demands.
- **Backward Compatibility:** all new technologies are expected to be compatible with the already existing legacy technologies. This is important because old technology should not become obsolete till the time the new one is completely adopted.
- **End-to-End-Connectivity:** an IoT system is complex architecture of sensors, end user device, a control plane, and a data plane. All these components need to be connected from one end to the other via gateways for a seamless service to be deployed.
- **Interoperability:** as mentioned above, an IoT system consists of multiple components and each component is supplied by multiple vendors. For this reason, it is important to have interoperable communication so as similar components from all vendors can interact without any hiccup.
- **Standards:** for interoperability to be in place, there is an absolute need of well-defined standards. The protocol, technologies and the physical components should be standardized for maximum interoperability.

²⁵³³ Operational technology (OT) is hardware and software that detects or causes a change through the direct monitoring and/or control of physical devices, processes and events in the enterprise.

- **Spectrum requirements:** for wireless communications, the regulatory mechanisms for licensed and unlicensed spectrum should be taken into consideration.
- **Power:** availability and consumption of power is a prerequisite for IoT systems to operate.
- **Storage Needs:** the data release from sensors and IoT devices installed needs to be stored for reference and analysis. Since the development is at an industrial level, data produced is expected to be a huge amount. A robust storage infrastructure is required to collect the data produced by IoT devices.

One such storage medium is cloud infrastructure which is discussed in the following section.

10.2.2.3. Cloud Infrastructure

The flexibility of cloud infrastructure is its one of the major advantages. A cloud can be implemented in one of the following three models-

- **SaaS:** Software as a Service is the most widely implemented cloud service model. SaaS employs the internet to provide distributed applications and services, eliminating the need for clients to download any software. With SaaS, a cloud vendor has complete control over applications, data, runtime, middleware, operating systems, services, storage, networking, and virtualization.
- **PaaS:** Platform as a Service offers a platform to create software. With PaaS, the cloud vendor assumes a majority of the service, including runtime, middleware, operating systems, servers, storage, networking, and virtualization. The client only needs to take care of the applications and data.
- **IaaS:** Infrastructure as a Service offers an extensively automated and scalable service to clients. Clients are allowed to buy resources as required without relying on in-house hardware. With IaaS, the cloud services like applications, data, runtime, middleware, and operating systems managed by a company, including but the cloud vendor is responsible for the storage and virtualization.

There are several advantages of installing a cloud infrastructure as a storage medium. Some of the advantages are discussed below:

- **Economic Alternative for Storage:** the installation of cloud infrastructure significantly reduces the operating cost of a company installing and managing a data center. With cloud infrastructure, a company just needs to pay for its usage as a pay-as-you-go service.
- **Agility and Flexibility:** most cloud service infrastructure is installed as independent modules and self-managed services. With a cloud infrastructure managing processes, a user becomes more business-oriented than IT-focused.

- **Security:** Cloud infrastructure technologies and providers are always refining protection against viruses and other data breaches with advanced encryption keys and a hybrid approach which stores sensitive data in a private cloud and other general data in a public cloud.

10.3. Estimating the future IoT and 5G patent landscape

10.3.1. IoT standards and patent landscape

IoT standards cover many different layers and are developed by numerous Standard-Setting Organisations (SSO). A study by Al-Fuqaha and others identifies a number of IoT layers each with a unique standards and applications, as shown in Table 1 below.

Table 10.1: overview of IoT layers, standards and applications²⁵³⁴

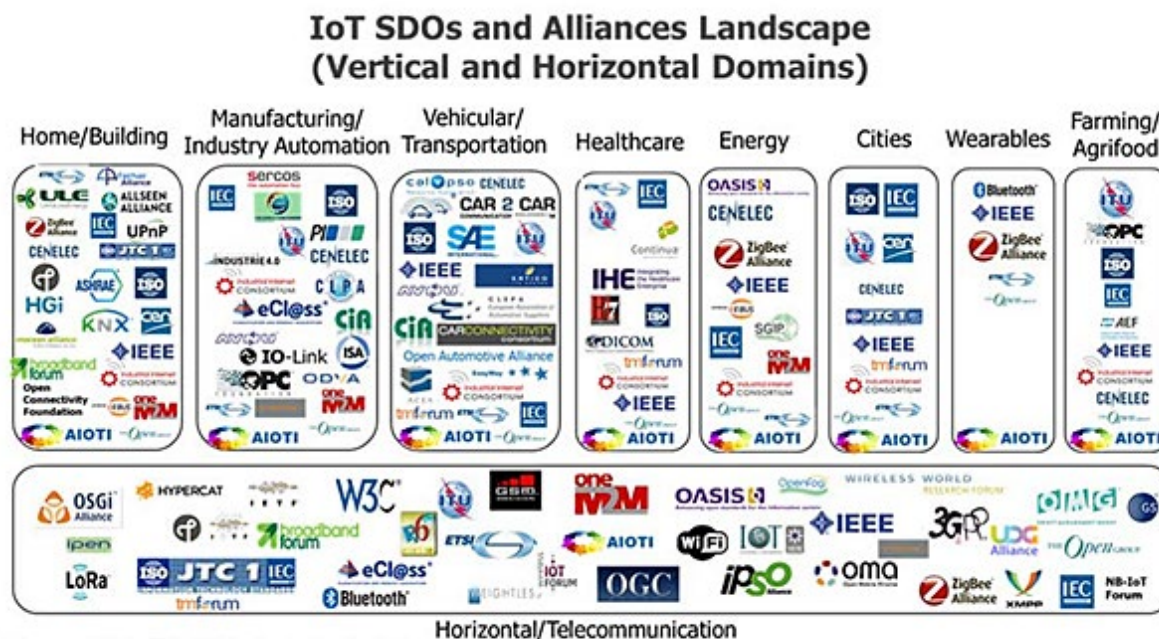

IoT Elements		Samples
Identification	Naming	EPC, uCode
	Addressing	IPv4, IPv6
Sensing		Smart Sensors, Wearable sensing devices, Embedded sensors, Actuators, RFID tag
Communication		RFID, NFC, UWB, Bluetooth, BLE, IEEE 802.15.4, Z-Wave, WiFi, WiFiDirect, , LTE-A
Computation	Hardware	SmartThings, Arduino, Phidgets, Intel Galileo, Raspberry Pi, Gadgeteer, BeagleBone, Cubieboard, Smart Phones
	Software	OS (Contiki, TinyOS, LiteOS, Riot OS, Android); Cloud (Nimbits, Hadoop, etc.)
Service		Identity-related (shipping), Information Aggregation (smart grid), Collaborative-Aware (smart home), Ubiquitous (smart city)
Semantic		RDF, OWL, EXI

Indeed, numerous SSOs are developing standards for the application in the IoT ecosystem. Study by ETSI shows large international formal SSOs such as ISO, ITU-T, IEC, ETSI, CEN-CENELEC; quasi-formals SSOs such as IEEE, W3C as well as numerous smaller consortia present in the IoT standardisation system.²⁵³⁵ Picture 7 below illustrates the involvement of SSOs in different areas where IoT technologies will be used.

²⁵³⁴ Taken from Ala Al-Fuqaha, Mohsen Guizani, Mehdi Mohammadi, Mohammed Aledhari, Moussa Ayyashi, 'Internet of Things: A Survey on Enabling Technologies, Protocols and Applications' (2015) 17(4) IEEE Communications 2347.

Source: AIOTI WG3 (IoT Standardisation) – Release 2.6

Standards are often covered by patented technologies and the information about their owners can be obtained by looking at patent applications filed at patent offices. Precisely such a study was done by the European Patent Office (EPO) which measured the number of patent applications in areas related to the IoT sector. The EPO classified IoT inventions into three main sectors, Core technologies, Enabling technologies and Application domains.²⁵³⁷ Each main technological sector is further broken down into smaller technology fields such as Hardware, Software and Connectivity (as Core Technologies) that enable the connection of objects to the internet; Analytics, Security, AI, 3D Systems, User Interface (as Enabling Technologies) are used in combination with connected objects and Home, Personal, Enterprise, Manufacturing, Infrastructure and Vehicles (as Application domains) where a connected object can be used.²⁵³⁸ EPO found that applications for patents in the IoT field are increasing, the growth rate was 54%, far outpacing the overall growth rate of other patent applications of 7.65%.²⁵³⁹ More than 5,000 patent applications for inventions related to autonomous objects were filed in 2016 alone.²⁵⁴⁰ As to the largest patent holders, a study by EPO shows that the field is dominated by the large European, American and Japanese companies, but with Korean and Chinese companies increasingly innovating and filing for patent applications. The largest individual patent applicants are, in fact, two Korean companies (Samsung and LG). The table below provides information on the largest patent applicants at EPO in the IoT field.

10.3.2. 5G patent landscape

The internet connectivity in the IoT is expected to be brought about by the incoming 5G standard. The 5G communication standard is anticipated to be 100 times faster than the existing 4G LTE standard, with faster data rates and extremely low end-to-end latency.²⁵⁴² It will enable machines to directly communicate between each other and will be used across IoT application in various industry sectors. 5G economy will see cellular coverage extending into a broader range of structures such as office buildings, industrial parks, shopping malls, but also in domestic appliances, cars and machines. With improved capacity to handle significantly greater number of devices using high volumes of data, 5G will be a key enabler of IoT connectivity.²⁵⁴³

Like other standards, 5G is covered by patents. A study by IPLytics provides an overview of the patent landscape for 5G, which is dominated by Asian firms; in contrast to 2G, 3G and 4G standards where SEPs were mainly in the hands of large European and US companies. According to IPLytics, the largest 5G patent owner is Huawei, with Samsung and ZTE also in the top five. European companies Nokia and Ericsson also have a strong patent portfolio, while US company Qualcomm is at a sixth place, behind Asian and European firms. Table 3 below illustrates 5G patent ownership as of February 2019.

Table 10.3.: 5G patent owners²⁵⁴⁴

Measuring patent ownership is not the only way to assess one company's impact on standard's development. Another way is to look at technical contributions submitted by each company at standardisation meetings. Again, data from IPLytics show that Huawei is the most active contributor of technologies in 5G standards. Table below shows the top companies that made technical contributions to 5G technology.

nology Will Contribute to the Global Economy' (January 2017).

Table 10.4.: 5G Standard Contributions per Company²⁵⁴⁵

10.4. What types of standards are to the greatest extent covered by patents?

Products today need to interoperate with their ‘ecosystem’ to a much greater degree than before. In fact, a product’s degree of compatibility with a system is of significant importance when the general consumer makes his or her decision whether to purchase that product or not. To achieve compatibility firms need agree on the interfaces between products so that the essential parts of a product may interoperate with its surrounding. Several definitions of standards are given in the literature, by standard-setting organizations and political institutions.

ISO/IEC Guide 2:1996, definition 3.2 defines a standard as:²⁵⁴⁶

‘A document established by consensus and approved by a recognized body that provides for common and repeated use, rules, guidelines or characteristics for activities or their results, aimed at the achievement of the optimum degree of order in a given context’.

²⁵⁴⁵ Taken from: IPLytics, ‘Who is Leading the 5G Patent Race?’ (February 2019), p. 5.

²⁵⁴⁶ ISO/IEC Guide 2:2004, Standardization and related activities -- General vocabulary, <https://www.iso.org/standard/39976.html>

Given the above, the definition of a standard is wide, including not only interoperability standards, but also, for example, product, service, safety and environmental standards. It seems actually that a standard at its widest definition could plainly be described as *a structure for a solution to a demand*. Naturally, standards may be divided into different groups. They are given different names depending who is discussing standards. The ISO classification of standards may be divided into eight groups:²⁵⁴⁷

- (i) **Basic standard** has a broad ranging effect in a particular field. (These standards could be called and regarded as infrastructure standards.)
- (ii) **Terminology standards** define words permitting representatives of an industry to understand and communicate.
- (iii) **Testing standards** define the test methods to be used to assess the performance or other characteristics of a product.
- (iv) **Product standards** establish qualities or requirements for a product (or related group of products) to assure that it will serve its purpose effectively.
- (v) **Process standards** specify requirements to be met by a process, such as an assembly line's operation, in order to function effectively.
- (vi) **Service standards**, such as for servicing or repairing a car, establish requirements to be set in order to achieve the designated purpose effectively.
- (vii) **Interface/interoperability** standards, such as the point of connection between a telephone and a computer terminal, are concerned with the compatibility of products.
- (viii) **Standard on data**. The last type provides a listing of characteristics for value of data specifying a product, service, data-set etc.

In addition to the above product and service standards, but also other forms of standard such as interoperability standards, may be divided into performance (also called general uniformity or non-product standard) and design standards (also called prescriptive or product standards). A performance standard implies that the standard only stipulates certain performance that the product or service should meet to fulfil the standard, while a product or design standard stipulates specific requirements for the goods.

From a competition law perspective, it is of fundamental importance to grasp what sort of standard is up for scrutiny. Under antitrust law, several types of standards should be acknowledged as well as their different implications for markets and competition. Interoperability or interface standards, which guarantee that products made by different firms can interoperate, should be distinguished from general uniformity standards (sometimes called performance or non-product standards). Similarly, general uniformity standards (performance standards), which set minimum requirements for all products on a market, should be distinguished from design standards.²⁵⁴⁸

2547 See Liguozhang, Standardization and Patent Licensing in the European Union (Oy Nord Print Ab 2012), 26, with references.

2548 For a somewhat similar division, see Gregory Tasse, 'Standardization in Technology-Based Markets', (2000) 29 Research

Performance standards/general uniformity standards are often set by SSO connected to trade organizations, while interoperability or design standards are more specific and may, in combination with relevant intellectual property rights, restrict competition and product diversity. Actually, a design or prescriptive or, in other words, technical requirement standard regarding the parts, content or form of a product or technical solution, such as cement, tyres or even technologies for storing music or film (e.g. Memory stick, VHS, CD-rom or DVD technology) is a fundamentally different standard from an interoperability standard, which, in turn, *de facto* may reflect an infrastructure standard. Design or product standards may reflect a standard for one solution on a market that may efficiently harbour several different such standards or technologies.

Basic or infrastructure standards may have significant implications for an industry. They constitute the fundamentals for where trade will take place and several of the interoperability standards developed today are the infrastructure of the present and the future. Presumably, examples of such standards are the different generations of telecommunications network technologies.

Likewise, a design standard is, from a competition law perspective, different from a general uniformity or performance standard, where the standard only stipulates certain requirements for the product to fulfil to be able to meet the standard. A general performance standard, for example certain environmental or safety standards, may represent a competition law problem less often since it seldom implies that certain products or firms will be excluded from the relevant market or technology. Such standards only stipulate certain requirements for the performance of the product, e.g. what kind of heat a product should withstand or what degree of emission a product may give off, and, thus, give the manufactures the liberty to compete through innovation over how to fulfil these requirements.

It seems that the notion of interoperability is also used now for standards that were previously considered infrastructure standards. For example, standards for the railway system (e.g. for the gauge, couplings, brakes, and signalling), and standards for public safety (e.g. firefighting material), or for the armed forces, are today considered to be interoperability standards, while previously they were considered basic infrastructure standards.

Clearly interoperability standards refer to the ability of different (technical) units to combine, but it may today also be used in reference to organizations. Nonetheless, internet or telecom interoperability, the technology of the internet or the telecom technology of UNMTS or 3G must be treated differently in reference to interoperability and/or infrastructure standards from prescriptive or design standards.²⁵⁴⁹ Prescriptive design stan-

Policy 587, 589 et seq.

2549 Furthermore, interoperability means different things also within IT and telecoms. According to ISO/IEC 2382-01, Information Technology Vocabulary, Fundamental Terms, interoperability is defined as follows: 'The capability to communicate, execute programs, or transfer data among various functional units in a manner that requires the user to have little or no knowledge of the unique characteristics of those units'. Under telecoms, interoperability is under said ISO standard defined differently: 'The ability of systems, units, or forces to provide services to and accept services from other systems, units or forces and to use the services exchanged to enable them to operate effectively together. The

dards may very well reflect a new product in an existing market with other competitive solutions, while interoperability standards, through for example network (tipping) effects on the market, may very well develop or represent *de facto* virtual infrastructure. The market and industry will only, efficiently, be able to facilitate one such standard, and, while there may be dynamic competition over what it should be in the pre-standardization phase, when the technology is fixed, it will be the infrastructure for other markets to develop.

Notwithstanding these fundamental differences, the standards discussed here are mainly *interoperability* network-driven standards for the telecom sector or ICT sector, being either horizontal or vertical. The horizontal standards for the ICT, Internet or IoT can be of infrastructure type, developed through technical innovations, patent protected and often governed by a standard setting body such as ETSI or IEEE. For example the 5G now being launched is a horizontal standard for transferring mobile data and speech developed under ETSI. Indeed, it is the infrastructure, hardware oriented horizontal technical standards that normally are covered by a thicket of patents.

Vertical standards for the Internet are on top of the horizontal infrastructure type standards, and are today more and more data oriented, where a dominant system leader decide on certain technical standards with thereto connected APIs (open, privileged or private) for interoperability within respective ecosystem. The technology selected is the prerogative of the system leaders and through contracts with non-assertion covenants, the system leaders are often able to immunise the ecosystems from infringement claims based on intellectual property rights.

Other more 'product-oriented' standards, such as standards for different data/music storage solutions are different. Possibly, there are patents covering the data storage or clouds, however, there are few infringement cases. There are also widely used product standards that are in-between, such as AVC/H.264 video code for the internet, and they will also be discussed, while general uninformative or performance standards will not be analysed in this chapter because they, as stated, seldom represent competition law problems.

In other words, one could identify standards and/or technologies, and collaborations connected to them, and divide them loosely into four categories, depending on their anti-competitive effects. This is difficult because standards are in many ways overlapping. Especially, there is an overlap between the notion of infrastructure and interoperability standards. Nonetheless, from a competition law perspective the division helps when analysing their different anti-competitive effects

A	B	C	D
Infrastructure	Interoperability	Data	Device

This division into four groups will be used to explain, classify and discuss standards and

definition can be extended to the condition achieved among communications-electronics systems or items of communications-electronics equipment when information or services can be exchanged directly and satisfactorily between them and/or their users'.

their potential anti-competitive effects throughout this chapter. The division is somewhat interlinked to the discussion where competition by substitute, eg platform v. platform may still survive or where network effects and tipping has created a monopoly and a “failed” market is created where only competition by imitation can be upheld. Where the system leader may acquire a special responsibility to uphold competition within the ecosystem (the failed market). The A and B standards are horizontal, ‘one of a kind’ technologies for whole industries, while C and D standards can be vertical or more ecosystem specific. Indeed, they can differ for ecosystem to ecosystem.

10.5. Different layers of standards, Infrastructure or lower layer interoperability, upper layer data interoperability

There is a great need for interoperability so to create the Digital Economy. Basic interoperability, to materialize, needs some joint way of communication, or that one technology is adopted as the technical standard either *de facto* or *de jure* by the industry as a whole. Indeed, for the Digital Economy, IoT standards in general and functional IP rules/guidelines under these standards in particular seem to be desirable. When IoT will happen, devices will communicate with other devices, with the telecom technology, and with the Cloud. Devices and device producers need interoperability otherwise the internet of things may not materialize. We are at the beginning of the development of everything’s interoperability and the need of technical standards to enable this is great.

There is currently a global technical standard race for IoT. Several different SSOs are fighting to become the SSO part of the collaborations that enact the standards for the new IoT era. Moreover, several pre-standard collaborations (consortia) are being formed including several different combinations of important players for the technologies that might be included in the IoT standards. These consortia are like “pacts” conducting lobbying and outright frontal attacks on other formations or pacts, all in the effort of getting their technologies inside the relevant standards.²⁵⁵⁰

Of course, the incumbent SSOs are adapting to the new paradigm, e.g. ETSI, even CEN and CENELEC claim relevance in the IoT paradigm. But there are special IoT SSOs. For example, in 2015, the EU Commission and various IoT players launched a large-scale alliance called AIOTI (Alliance for Internet of Things Innovation) with the aim to assist the European Commission in the innovation and standardization policies.²⁵⁵¹

Whether these collective efforts under SSOs will be relevant in a world where Google (Brillo and Weave), Apple (HomeKit), Samsung (SmartThings), Amazon (Alexa) and Microsoft (Windows 10 IoT editions) are all bringing out their own unilateral IoT solutions is still to be seen. Perhaps, there will be no market for the SSOs and these firms will instead create the *de facto* IoT standards either just for their respective ecosystem (includ-

²⁵⁵⁰ For a analysis of the political and technical interface of standard-setting Bjorn Lundqvist, *Standardization Under EU Competition Rules and US Antitrust Laws – The Rise and Limits of Self-Regulation* (Edward Elgar 2014), 16.

ing many vertical dependent firms) just as Google's Android became the de-facto open mobile OS?²⁵⁵²

There are several layers of technical standards, and only a few standards are actually of infrastructure interoperability type. Indeed, at a minimum, one should distinguish standards for the "lower" and the "upper" layer, pointing to a division between infrastructural interoperability and data interoperability. While infrastructural interoperability enables devices to exchange data under common network protocols, data interoperability concerns more directly users and developers of IoT applications within separate ecosystems, allowing them to meaningfully connect mainly their software interfaces of those applications.²⁵⁵³ Indeed, upper layer interoperability is attained by reading and reproducing specific parts of computer programs, called interfaces, which contain the information necessary to "run" programs in a compatible format.²⁵⁵⁴

It is from the perspective of the user/consumer of the computer program, user interfaces are relevant to the extent that they enable him or her to visualize and deploy a specific set of commands or modes of interaction with the program, that can potentially be replicated into another (different) application. Importantly, although this kind of interoperability can increase a program's utility to the user, it is not required for the purpose of its technical functioning. Most choices for user interfaces are indeed dictated not so much by functional elements of the program, as by the pursuit of the goals of user friendliness, aesthetical appeal and promotion of brand-specific features, often inside the ecosystem.²⁵⁵⁵ Moreover, there does not seem to be one way of solving the need for upper level interoperability since communication will be done in several modes. Indeed, it seems that different collaborations, or ecosystems, may provide similar but still different designed data interoperability. Indeed, well-functioning data interoperability within separate ecosystems created network effects inside the ecosystem, while still these systems may compete in between themselves.

In addition, there also seem possible to make a distinction between horizontal and vertical upper level standards. As Kerber and Schweitzer explain, "[p]articularly important is the distinction between horizontal and vertical [semantic] interoperability. Horizontal interoperability denotes the interoperability of competing products, services or platforms. One example is the interconnection between communication networks. Vertical interoperability refers to the interoperability of a product, service or platform with complementary products and services. The degree to which complementary products (e.g., digital goods as music files or e-books) can be shared across different platforms, and complementary products of one platform can be accessed from rival platforms is said to characterize the horizontal openness of a platform. The ability of independent firms to

2552 Terry Hughes, 'A world with more IoT standards bodies than IoT standard', (16 March 2016) available at: <http://internetofthingsagenda.techtarget.com/blog/IoT-Agenda/A-world-with-more-IoT-standards-bodies-than-IoT-standards>.

2554 Ibid.

2555 Ibid.

offer complementary products on a platform stands for its vertical openness.”²⁵⁵⁶

This is an interesting observation, and an issue would be whether, from a competition policy perspective, horizontal openness in vertical interoperability should be promoted, or whether system competition, between ecosystems, should be promoted. Kerber and Schweitzer seem to urge caution in creating open (industry-wide) standards in this regard, and that competition between vertical data interoperability systems (ecosystems) should be given room to foster the market. Only when we can identify market failure should industry wide standards be promoted, and tolerated, under competition law, according to the authors. Industry-wide standards may have several anticompetitive effects, especially by lessening or totally eliminating competition between technical systems (i.e. substitute technology competition), while only allow for competition between complementary products in the same technology (rivalry based on the same technology platform, through competition based on design and some form of imitation).²⁵⁵⁷

The two main market failures Kerber and Schweitzer identify are, firstly, dominant or monopoly firm, where one firm won the rivalry for the demand and obtained unilateral power to decide on the prevailing standard. The authors put in this group the monopolist that obtained its market power through network effects and “tipping”. The second example of market failure that requires an industry-wide standard is according to the authors when the technology being standardized is of infrastructure character and the economic advantages are so great that the industry can only have one standard, i.e. the market tend to be a natural monopoly.²⁵⁵⁸

Presumably, a third market failure situation would be markets where the patent or intellectual property thicket has become so wide that the industry or relevant market is not functioning or even emerging; and that access to SEPs need to be obtained through a industry wide *de jure* standard with the complementary SSO IP Guidelines.²⁵⁵⁹ Indeed, an object for the implementation of *de jure* telecom standards was to overcome the patent thicket in the technology.²⁵⁶⁰

It is interesting to pursue the idea that industry-wide standards should be leniently treated or even promoted in these three instances of market failure, while in other scenarios consortia driven standard-setting as well as unilateral standard efforts should benefit from heightened scrutiny under competition law since such collaboration may lead to exclusionary collusive behaviour or anticompetitive exclusionary abusive conduct.

From a data and IoT perspective, interestingly, the issue is not only what standards are being utilized. It is often more relevant to discuss control, for example: (i) Who controls the sensors embedded in infrastructure? (ii) Who controls the sensors in devices? (iii) Who controls the flow of information between the moving parts of the IoT and the static

parts of the IoT? (iv) Who controls the user interfaces?. These issues will be described when analysing upper layer standards below.

10.6. Distinguishing between open source versus proprietary models/ecosystems: the crucial role of interoperability

As we have explained in Chapter 3, the governance of digital ecosystems may take different forms. Firms put in place strategies in order to capture a disproportionate amount of the surplus value created by the innovation. In some situations, the most effective strategy will be to opt for an 'open architecture' that nurtures complementarity through an open eco-system, should a system of 'open innovation' be the most effective way to generate higher value in this industry. In other situations, firms may opt for a 'walled garden approach', opting for a closed architecture with regard to firms with competing assets and capabilities entering the value chain while keeping it open for firms with complementary assets. Finally, in other circumstances, firms may opt for vertical integration; taking full control over the rents generated by the complementarities brought by the innovation whilst maintaining the possibility to exclude or marginalize any new entrant, for instance, by denying interoperability with regard to some indispensable technological interfaces.

Open interfaces ensure interoperability so that a platform may be used by more people and more companies, the entity controlling the platform earning from the increase of the value of the platform and therefore the price paid for it and of itself. By becoming system integrators, the architects of digital ecosystems capture value from both the development of new products that they may be able to provide and some of the surplus value from the use of their platform.

In a fast moving technological environment where the boundaries of the various industries are blurred, interoperability will be important for both 'open' and vertically integrated digital ecosystems. Interconnectivity will be implemented through Cyber-Physical Systems (CPS) combining 'real-time data acquisition from the physical world and information feedback from the cyber space' with 'intelligent data management, analytics and computational capability that constructs the cyber space'²⁵⁶¹. These will enable cognition (e.g. quality controls of the various machine components and product quality reasoning), and at the level of configuration self-adjustable prognostics and the development of self-optimized machine tools.

In view of the important fixed costs to develop these technologies, which will need to be shared among the various industry participants, the complexity of the transactions and the need for data, 'open manufacturing' initiatives will therefore become more common in Industry 4.0 in view of the importance of interoperability in these complex technological and business environments²⁵⁶². For instance, Microsoft and car manufacturer

2561 J. Lee, B. Bagheri, H.-A. Kao, A Cyber-Physical Systems architecture for Industry 4.0-based manufacturing systems, (2015) 3 Manufacturing Letters 18.

2562 On the importance of interoperability for Industry 4.0., see Y. Lu, Industry 4.0: A survey on technologies, applications

BMW have launched in 2019 an open industrial IoT platform, the 'Open Manufacturing Platform', in order to develop common production and logistics optimization efforts and cross-industry collaboration²⁵⁶³. The platform aims to standardise data across data producers, provide central auditability, enhance common data monetization opportunities through controlled sharing and ownership of data, and become an open source for Open Manufacturing Platform components. Members of this Open Manufacturing Platform will cooperate and share a set of information with the OMP community about the roadmap of use cases to be developed and made available for the rest of the platform. Members will maintain ownership of their own data and IP rights.

'Intelligent interoperability' should enable devices (sensors and actuators) to describe themselves in a way that is understandable by both machines and humans²⁵⁶⁴. These implicit or explicit semantics would power a dynamic Industry 4.0 production line. This dynamic perspective in interoperability as a fundamental principle of Industry 4.0. and the IoT indicates the importance of developing common or de facto connectivity (interoperability) standards.

10.7. Connectivity (interoperability) standards

As seen, connectivity (interoperability) standards specify how different technologies interact with one another and work together successfully.²⁵⁶⁵ Technical interoperability standards are important in many industries but are especially relevant to the ICT sector and the emerging Internet of Things. They enable, for instance, to make and receive calls from smartphones from different manufacturers or that computer hardware components from various producers may be combined to create a functional computer. In the IoT they will enable connected devices such as cars, domestic appliances, wearables and industrial equipment to communicate seamlessly with each other, regardless of manufacturer, operating system, or other technical components.²⁵⁶⁶ An example of well-known connectivity standards are 3G (UMTS), 4G (LTE) and upcoming 5G cellular standards, Wi-Fi, Bluetooth and USB.

Interoperability standards are covered by patented technology and the proper use and licensing of standard-essential patents has been the subject of world-wide litigation and controversy, as will be described below.

10.7.1. The notion and controversy surrounding Standard Essential Patents

A patent is said to be standard essential if it must be implemented to comply with a standard.²⁵⁶⁷ In other words, there are no other ways to use the standard without infringing the SEP and any company implementing a standard would need to take a license for SEPs. Well known technology standards often include thousands of SEPs. For example, according to some estimates, there are over 45,000 and 39,000 patents declared essential to 4G LTE and 3G UMTS respectively,²⁵⁶⁸ while the Wi-Fi standard is estimated to have around 3000 declared SEPs.²⁵⁶⁹

In order to make the implementation of the standard widely accessible, SSO typically require patent owners to commit to make licences for SEPs available on fair, reasonable and non-discriminatory terms.²⁵⁷⁰ A FRAND commitment is said to pursue two main principles: on the one hand ensuring widespread access and implementation of the standard by standard-implementers and, on the other hand, securing adequate invention incentives by technology developers. Namely, standardisation efforts would be wasted if subsequent implementation of a standard would be blocked because of unavailability of the patented technology.²⁵⁷¹ Generally, patents give their holders the right to exclude others from using patented inventions. Normally patent holders are free to decide whether to license their patents or not, and if they do decide to make licenses available, they are free to set the terms.²⁵⁷² A FRAND commitment, however, is a constraint on a patent holder's freedom to choose whether it wants to license or not, as well as on the terms of such licence. Consequently, the FRAND commitment ensures that the patent holder will not deny licences for its SEPs and will also make them available under terms

2567 See ETSI, Intellectual Property Rights Policy (28 November 2017) Article 15; IEEE, Standard Boards Bylaws (December 2017) Clause 6.1 ("Essential Patent Claim" shall mean any Patent Claim the practice of which was necessary to implement either a mandatory or optional portion of a normative clause of the IEEE Standard when, at the time of the IEEE Standard's approval, there was no commercially and technically feasible non-infringing alternative implementation method for such mandatory or optional portion of the normative clause."); ITU-ISO-IEC, 'Patent Statement and Licensing Declaration for ITU-T, ITU-R Recommendation, ISO or IEC Deliverable' (26 June 2015) ("Essential patents are patents that would be required to implement a specific Recommendation | Deliverable").

2569 In re Innovation IP Ventures LLC Patent Litigation 2013 WL 5593609 (N.D. Illinois 2013) at 43. However, not all declared essential patents are essential in fact due to widespread overdeclaration problem. Studies and cases have demonstrated that only approximately between 20%-50% of declared patents are actually essential for a standard. See: Tim Pohlman, Knut Blind, 'Landscaping Study on Standard Essential Patents (SEPs)' (2017) p. 48-49.

2570 Justus Baron, Daniel Spulber 'Technology Standards and Standard Setting Organisations: Introduction to the Searle Center Database' (2018) 27 *Journal of Economics & Management Strategy* 462 (studying IPR policies of 37 SSO and find that 32 SSOs allow for FRAND licensing, with the remaining 5 SSOs require royalty-free licensing).

2571 See: Keith Maskus, Stephen Merrill (eds.), 'Patent Challenges for Standard-Setting in the Global Economy: Lessons from Information and Communication Technology' (National Research Council 2013) pp. 52-61 (discussion some objectives of FRAND licensing).

2572 For overview of patent rights see: Tanya Aplin, Jennifer Davies, *Intellectual Property Law: Text Cases and Materials* (2nd edition, Oxford University Press 2013) pp 562-563 ("patent law confers a property right, i.e. a right enforceable in rem rather than in personam. Thus, a patent owner can exercise her exclusive monopoly right against third parties...").

that are fair and reasonable. On the other hand, the FRAND commitment, also protects the interests of patent holders who are assured that they will be adequately rewarded for the use of their technology.²⁵⁷³ Patent holders need adequate compensation for the investment in research and development of new technologies, securing incentives to innovate in the future. Otherwise, there is a risk that patent holders would abandon open collaborative standardisation and opt instead for creating closed proprietary standards.²⁵⁷⁴

The FRAND commitment therefore represents a balance between the interests of standard implementers and patent holders.²⁵⁷⁵ These interests are not opposed but are mutually reliant. Manufacturers want best available technologies to make successful innovative products, and standard developers are also interested in successful implementation of standardised technologies in order to earn adequate rewards for their research and development and invest in further innovation.

However, the problem in practice is the vagueness and indefiniteness of what FRAND terms precisely are.²⁵⁷⁶ What is fair and reasonable to a large patent owner may not be for a standard implementer. The unclarity about the precise meaning of FRAND licensing terms has led to disputes between large technology companies and to full-blown smartphone patent wars involving almost every company in the smartphone industry. The next section will look more closely on the elements of FRAND commitment that produced tensions in practice.

10.7.2. The meaning of FRAND commitment to license Standard Essential Patents

What FRAND is about involves a complex mutual interrelation between contract, patent and competition law. As it will be seen, some legal system see FRAND commitment as an enforceable contract for the benefit of third parties, while other use (or try to use) competition law to ensure FRAND's enforceability. FRAND commitment also impact the availability of patent remedies – injunctions and patent damages. Finally, there are debates about what principles should FRAND royalty include and on what royalty base should be used for FRAND royalties. These issues will be discussed in turn.

2573 See ETSI, Intellectual Property Rights Policy (29 November 2017) 3.2 ("IPR holders whether members of ETSI and their AFFILIATES or third parties, should be adequately and fairly rewarded for the use of their IPRs in the implementation of STANDARDS and TECHNICAL SPECIFICATIONS") [emphasis added].

2574 Jorge Padilla, John Davies, Aleksandra Boutin, 'Economic Impact of Technology Standards' (Compass Lexecon 2017 (finding that open collaborative standards are more innovative and beneficial to the economy than closed propriety standards)).

2575 ETSI, Intellectual Property Rights Policy (29 November 2017) 3.1 ("the ETSI IPR POLICY seeks a balance between the needs of standardization for public use in the field of telecommunications and the rights of the owners of IPRs.")

2576 See Mark Lemley, 'Intellectual Property Rights and Standard-Setting Organizations' (2002) 90 California Law Review 1889, 1964 ("it is all well and good to propose that SSOs require licensing on reasonable and non-discriminatory terms. But without some idea of what those terms are, reasonable and non-discriminatory licensing loses much of its meaning.").

10.7.2.1. The nature on FRAND: the interplay between contract, patent and competition law

Under one interpretation, when the SEP holder submits a FRAND commitment it enters into a binding contract with the SSO that it will make licenses available for its SEPs on FRAND terms to all third parties implementing a standard. Implementers of a standard may then rely on this FRAND contract between the SEP holder and the SSO as a third party intended beneficiaries. Accordingly, contract law lies at the heart of enforcing FRAND commitments. The notion that FRAND commitment is of contractual nature has been widely recognised in the literature.²⁵⁷⁷

The benefits of conceptualising a FRAND commitment as an enforceable contract is that it gives all standard implementers a right to challenge the licensing terms offered by SEPs holders before court. It is fundamentally a remedy against holdup. If the SEP holder offers excessive non-FRAND licensing terms, standard implementers have the right to sue the SEP holder for the breach of contract and request the court to decide whether offered terms are FRAND and, if the court finds that they are not, to determine the precise FRAND licensing terms. Moreover, if the SEP holder is negotiating in bad faith, implementers may also bring breach of contract action.²⁵⁷⁸ By having the breach of contract action there can be no practical possibility for holdup, as implementers always have the option to go court.

However, the drawbacks of a contractual approach is that not all jurisdiction may accept such interpretation and recognise third-party beneficiary rights.²⁵⁷⁹ It appears that courts in Germany do not recognise FRAND as forming and enforceable contract but represent a mere invitation of third parties to make offers.²⁵⁸⁰

Nevertheless, courts in the US and the UK have recognised that a FRAND commitment creates a binding contract between the SEP holder and the SSO, and that standard implementers may enforce it as third-party beneficiaries. Courts analysed whether FRAND commitments given to IEEE, ETSI and ITU-T were enforceable contracts and found that

²⁵⁷⁷ See: Mark Lemley, 'Intellectual Property Rights and Standard-Setting Organisations' (2002) 90 California Law Review 1889, 1909-1917; Roger Brooks, Damien Geradin, 'Interpreting and Enforcing the Voluntary FRAND Commitment' (2011) 9 International Journal of IT Standards and Standardization Research 1, 2; Gregory Sidak, 'The Meaning of FRAND, Part II: Injunctions' (2015) 11 Journal of Competition Law & Economics 201, 210 ('The SEP holder and the SSO are parties to the contract, whereas the implementer of the standard (the licensee) is a third-party beneficiary').

²⁵⁷⁸ For example, seeking injunctions before offering licensing terms may be a breach of duty to negotiate in good faith. See: *Realtek Semiconductor v LSI*, 946 F.Supp.2d 998, 1008 (N.D. Cal. 2013) ('the court holds that defendants breached their contractual obligations to IEEE and to Realtek as a third-party beneficiary of that contract by seeking injunctive relief against Realtek before offering Realtek a license').

²⁵⁷⁹ For further criticism of contractual approach see: Jorge Contreras, 'A Market Reliance Theory for FRAND Commitments and Other Patent Pledges' (2015) 2 Utah Law Review 479.

²⁵⁸⁰ See: Thomas Cotter, 'Comparative Law & Economics of Standard Essential Patents and FRAND Royalties' (2014) 22 Texas Intellectual Property Law Journal 311, 318 (referring to two Germany cases); however for the contrary argument see: Claudia Tapia, *Industrial Property Rights, Technical Standards and Licensing Practices (FRAND) in the Telecommunications Industry* (Carly Heymanns Verlag 2010) p. 18-36, 39-40 (arguing how under German law it may be possible that a FRAND commitment constitutes a binding pre-contract for the benefit of third parties).

they were. For instance, in *Unwired Planet v Huawei* Birss J. analysed the nature of FRAND commitment given at ETSI, which is governed by French law, and found that it forms a binding contrary to which third parties may rely.²⁵⁸¹ Similarly in the US, Judge Robart found in *Microsoft v Motorola* found that Motorola's commitment given to IEEE and ITU created a binding contract which Microsoft could enforce as third party beneficiary, in particular because Microsoft was a member of these SSOs.²⁵⁸²

On the other hand, some authors claim that competition law should have a role to play regulating the enforcement FRAND commitments.²⁵⁸³ According to Shapiro and Melamed, holding an SEP can create or enhance the patent owner's market power.²⁵⁸⁴ *Ex ante*, before the patent is included in a standard, the patent owner's market power is constrained because it competes with alternative technologies to be included in the standard or to be used by standard implementers. However, *ex post*, after the patent is included in the standard, the market power of patent owner is increased because implementers are now locked-in to using the technologies claimed by SEPs. Implementers would be willing to pay a much larger royalty for use of the patented technology than they would have paid *ex ante*, when the SEP holder faced competition from other technologies. In these circumstances, according to Melamed and Shapiro, "the SEP holder has *ex post* monopoly power that, if left unchecked, would enable it to obtain royalties far in excess of the royalties that it could earn in a competitive market"²⁵⁸⁵ Thus, according to some commentators, competition laws should apply the police the *ex post* opportunist my SEP owners. Melamed, Shapiro, Chappatte, Cary and others argue that competition law should be used to address opportunistic conduct of SEP holders such as patent holdup and the imposition of excessive or non-discriminatory royalties.²⁵⁸⁶ Dolmans and Jones similarly argues that the use of injunctive relief by SEP holders should be a competition law infringement because it allows the SEP owners to pressure implementers into acceptance of excessive licensing terms.²⁵⁸⁷

2581 *Unwired Planet v Huawei* [2017] EWHC 2988 (Pat) paras 98-146.

2582 See: *Microsoft v Motorola*, 854 F.Supp.2d 993 (W.D. Wash. 2012).

However, others question the suitability and applicability of competition law in SEP context.²⁵⁸⁸ Enforcing a patent *ex post* is not a straightforward process. It requires going to court and provide the infringement and validity of patent, which may take years to decide. As seen, even if the SEP owner is successful in proving the infringement and validity of its SEPs, injunctions usually do not follow automatically, and going to court and asking for injunction would hardly scare infringers into accepting excessive licensing terms. Moreover, before ruling on an injunction, a court would first need to establish whether offered terms are FRAND. It is also submitted that US antitrust law does not prohibit excessive prices as such, while the legal standards for proving excessive prices under EU competition may not be adequate in the IP context.²⁵⁸⁹ According to Ohlhausen, only some form of deception during the standardisation process may involve actionable anti-competitive conduct.²⁵⁹⁰ Otherwise, as noted by Hovenkamp, “antitrust law is a blunt instrument for dealing with many claims of anticompetitive standard setting.”²⁵⁹¹

Despite voluminous academic debate, in practice, the application of competition law to FRAND disputes remained limited. As will be seen below, competition law was only raised successfully with respect to the use of injunctions in the EU and traditional competition law doctrines have proved to be difficult to apply in FRAND context.

Finally, FRAND commitment also affects patent remedies. As seen, patent law allows patent owners to demand and receive injunctions against patent’s unauthorised use, as well as to request the level of royalties they seem adequate. However, the FRAND commitment constraints both the availability of injunctions for the infringement of SEPs and the level of royalties the SEP owner can demand. As will be seen below, injunctions for SEPs are not automatic and it is increasingly difficult for the SEP owner to obtain them. In the US no enforceable injunction has been awarded for the infringement of SEPs,²⁵⁹² and SEP owners in the EU must comply with elaborate criteria set out in *Huawei v ZTE* judgment of the ECJ.²⁵⁹³ When it comes to assessing damages for the infringement of SEPs, FRAND commitment also constrain the amount of damages which must also be on a FRAND level.

10.7.2.2. FRAND Royalty Principles

Under which principles should a FRAND royalty be determined? This has been another area of contention where economists, companies and policy makers tried to set out some broad guidelines on how FRAND royalties should be calculated.

Under one approach, FRAND royalty should be based on the ex-ante incremental value of the patented technology before it was included in a standard.²⁵⁹⁴ The essence of this approach is that SEP owner should be able to capture only the value of its technology before inclusion in the standard, and not any additional value arising out of standardisation. Namely, during standard's development, different patented and unpatented technologies compete with each other for the inclusion in a standard. At that stage, the patent holder would only be able to charge an incremental value of its technology over the next best alternative. However, once a patented technology is chosen to be a part of the standard, other alternative technologies are eliminated. At that stage, the patent holder would allegedly be able to capture not only the incremental value of its technology over the next best alternative but also the full value of the standard, even though its technology makes only a modest contribution, as well as implementers' switching costs. Accordingly, it is alleged that the patent holder should not be able to capture this additional "holdup" value. Instead, the patent owners should be compensated only for the value of their technology before it was included in a standard.

The ex-ante incremental value approach has been very influential. The US and the EU competition authorities principally endorsed the ex-ante incremental value approach. The FTC in the 2011 Evolving IP Marketplace Study held that "a definition of RAND based on the ex-ante value of the patented technology at the time the standard is set necessary for consumers to benefit from competition among technologies to be incorporated into the standard – competition that the standard-setting process itself otherwise displaces",²⁵⁹⁵ and recommended to courts to "cap the royalty at the incremental value of the patented technology over alternatives available at the time the standard was defined."²⁵⁹⁶ More recently, the European Commission in its 2017 Communication on Standard Essential Patents recommended that a FRAND royalty for SEPs should primarily "focus on the technology itself and in principle should not include any element resulting from the decision to include the technology in the standard."²⁵⁹⁷ Moreover, US courts have also principally endorsed this notion of FRAND royalty. The Federal Circuit

2594 For economic literature see Mark Lemley, Carl Shapiro, 'Patent Holdup and Royalty Stacking' (2007) 85 Texas Law Review 1991, 2040-2043; Joseph Farrell, John Hayes, Carl Shapiro and Theresa Sullivan, 'Standard Setting, Patents and Hold-up' (2007) 74 Antitrust Law Journal 603, 637; Denis Carlton, Allan Shampine, 'An Economic Interpretation of FRAND' (2013) 9 Journal of Competition Law & Economics 531, 545. Recently, a group within CEN/CENELEC produced a guiding paper on the principles of FRAND licensing, supportive of the ex-ante incremental value approach. See: CEN/CENELEC, 'Core Principles and Approaches for Licensing of Standard Essential Patents' (January 2019) p. 7.

held that the FRAND royalty rate must be based “on the value of the invention, not any value added by the standardization of that invention,”²⁵⁹⁸ and that “any royalty award must be based on the incremental value of the invention, not the value of the standard as a whole or any increased value the patented feature gains from its inclusion in the standard.”²⁵⁹⁹ District courts have similarly rule that FRAND royalty should be based on patents ex ante value before it was included in a standard.²⁶⁰⁰

However, the ex-ante incremental value approach has been criticized in the literature.²⁶⁰¹ First, it does not take into account the fact that SEPs are largely developed with the aim of being part of the standard and technology may not exist independently of standard-development context.²⁶⁰² Technology developers invest significant resources into research and development of technologies precisely to be part of the standard, and technological solutions are developed and refined in parallel with standardisation efforts within SSOs. Consequently, there may not always exist alternative technologies for SEPs in question. Secondly, basing royalties on this ex-ante value would expropriate all the value of the standard to standard implementers. It is doubtful whether the ex-ante incremental value leaves enough incentives to invent and invest to future standard development.

Instead, it has been suggested that FRAND royalties should be based on upon the value of the patented standardised technology to users.²⁶⁰³ Such approach would arguably secure adequate incentives to invent with a reasonable cost to access the standard.

Be that as it may, these economic discussions are largely theoretical. Courts in practice use observable factors to calculate FRAND royalties by, for instance, looking at comparable prior licences for SEPs in questions and/or a top down approach which seeks to determine the total aggregate royalty for a standard and distribute it proportionally to SEP owners.²⁶⁰⁴

10.7.2.3. A FRAND royalty base: Smallest Saleable Patent Practicing Unit (SSPPU) or end product?

Besides royalty rate, another significant aspect is to look at appropriate royalty base for FRAND calculations. The choice is typically whether FRAND royalties should be based on the value of the final downstream product implementing the standard (the entire market value rule or EMVR) or based on the value of the infringing component itself (often called Smallest Saleable Patent Practicing Unit – SSPPU).

Again, the literature is split on this issue. On the one hand, some groups and commentators argue that applying royalties on end-products systematically overcompensates patent holders as it enables them to capture the value of other unrelated patented and unpatented features and components.²⁶⁰⁵ Basing royalties on final downstream products effectively represents a ‘tax’ on successful implementers who have made a significant investment in the development of downstream products and other valuable follow-on non-standardised technologies. Instead, they suggest that SEP royalties should be based on the value of components because they fully implement standard’s functionality.²⁶⁰⁶

On the other hand, others claim that it is a long-standing industry practice to license on the final downstream device, which is more efficient and properly takes into account the contribution of SEPs to final products.²⁶⁰⁷ The full value of the standard said to be fully realised only in final downstream products because of synergies and added value that SEPs bring.²⁶⁰⁸ Basing royalties on components would therefore systematically under-compensate SEP holders, diminish incentives to innovate and participate in the development of future standards.

2605 For overview of the literature in support of component licensing see: Mark Lemley, Carl Shapiro, ‘Patent Holdup and Royalty Stacking’ (2007) 85 Texas Law Review 1991, 2024; Janusz Ordover, Allan Shampine, ‘Implementing the FRAND Commitment’, (2014) October, The Antitrust Source 1, 10 (“our concern about using the price of the downstream device is that its market price can reflect a great deal of value to consumers derived from other sources”); Joseph Kattan, ‘The Next FRAND Battle: Why the Royalty Base Matters?’ (2015) 1 CPI Antitrust Chronicles 1; Joseph Kattan, Janusz Ordover, Allan Shampine, ‘FRAND and the Smallest Saleable Unit’ (2016) September, Competition Policy International 1; CEN/CENELEC, ‘Core Principles and Approaches for Licensing of Standard Essential Patents’ (January 2019) p. 7.

2606 Joseph Kattan, Janusz Ordover, Allan Shampine, ‘FRAND and the Smallest Saleable Unit’ (2016) September, Competition Policy International 1 (“with respect to the value of the technology, the standard is implemented in the component”).

2607 For overview of the literature supportive of end-device licensing see: Damien Geradin, Anne Layne-Farrar, ‘Patent Value Apportionment Rule for Complex, Multi-Component Products’ (2011) 27 Santa Clara High Technology Law Journal 763; Gregory Sidak, ‘The Proper Royalty Base for Patent Damages’ (2014) 10 Journal of Competition Law & Economics 989; Cristina Caffarra, Pierre Regibeau, ‘Patent Explosion and Patent Wars: Holdup, Royalties and Misunderstandings over “Market Value”’ (2014) https://ecp.crai.com/wp-content/uploads/2017/11/Caffarra_et_al_SEP_and_market_value_revised_clean.pdf; CEN/CENELEC, ‘Principles and Guidance for Licensing Standard Essential Patents in 5G and the Internet of Things (IoT), Including the Industrial Interent’ (2018) p. 7.

2608 See: Gregory Sidak, ‘The Proper Royalty Base for Patent Damages’ (2014) 10 Journal of Competition Law & Economics 989, 991 (“Using the price of the smallest salable patent-practicing component as the royalty base risks undercompensating the patent holder, because it ignores (1) the effects that the patented technology has on the value of the downstream product and (2) the value that synergies between complementary technologies create.”).

The roots of the discussion involving apportionment can be traced back to the US Supreme Court decision in *Garretson v Clark*²⁶⁰⁹ in the late 19th century.²⁶¹⁰ Addressing the issue of patent damages and apportionment, the Court held that “The patentee . . . must in every case give evidence tending to separate or apportion the defendant’s profits and the patentee’s damages between the patented feature and the unpatented features, and such evidence must be reliable and tangible, and not conjectural or speculative; or he must show, by equally reliable and satisfactory evidence, that the profits and damages are to be calculated on the whole machine, for the reason that the entire value of the whole machine, as a marketable article, is properly and legally attributable to the patented feature.”²⁶¹¹

The debate is especially fought in the US, where courts in some instances have required from patent owners, in case of complex multi-component products, to base their royalty demands on the value of the smallest saleable patent practicing unit (SSPPU).²⁶¹² However, in the case of SEPs the Federal Circuit clarified in *Ericsson v D-Link* and *CSIRO v Cisco* that “the rule ... which would require all damages models to begin with the smallest salable patent-practicing unit—is untenable”²⁶¹³ The Federal Circuit held that the SSPPU doctrine has two parts – a substantive legal rule and an evidentiary principle. A substantive legal rule is the requirement of apportionment, namely that “the ultimate combination of royalty base and royalty rate must reflect the value attributable to the infringing features of the product, and no more,”²⁶¹⁴ and that the apportionment could be done in various ways “by careful selection of the royalty base to reflect the value added by the patented feature, where that differentiation is possible; by adjustment of the royalty rate so as to discount the value of a product’s non-patented features; or by a combination thereof.”²⁶¹⁵ On the other hand, the evidentiary principle behind the SSPPU is the fear of jury bias. According to the Federal Circuit: “It is not that an appropriately apportioned royalty award could never be fashioned by starting with the entire market value of a multi-component product—by, for instance, dramatically reducing the royalty rate to be applied in those cases—it is that reliance on the entire market value might mislead the jury, who may be less equipped to understand the extent to which the royalty rate would need to do the work in such instance.”²⁶¹⁶ Therefore, it seems there is no legal requirement which would compel the parties to use the SSPPU as the royalty base. The

2616 *Ibid.*, 1226-1227.

exact FRAND royalty base would depend on the negotiation between the parties.

Despite the controversy, the most recent SEP cases involved courts calculating royalties on the value of final downstream products. In UK's *Unwired Planet v Huawei*,²⁶¹⁷ the court calculated FRAND royalties for Unwired Planet's 2G, 3G and 4G SEP portfolio on the value of Huawei's final products, while the same occurred in US' *TCL v Ericsson* case.²⁶¹⁸ It thus appears that large technology companies do, in fact, base their licences on the final downstream products.

10.7.3. Potential unilateral anticompetitive practices with respect to SEPs

Because of their strategic importance the conduct of SEP holders has been carefully scrutinised by competition law authorities. Three potential problematic practices have been observed to-date: i) seeking injunctions for infringement of SEPs; ii) refusal to license SEPs to competitors on a chip level and iii) the imposition of excessive non-FRAND royalties. These practices will be analysed in detail below.

10.7.3.1. Injunctions and standard essential patents

An injunction is a patent law remedy for the infringement of a valid patent which prohibits future acts of infringement. If the injunction is granted, the defendant must stop selling the infringing product until it secures a licence or designs around the patent.

The use of injunctions for SEPs has been highly controversial. Injunctions have been seen as a tool for opportunistic 'patent holdup' strategies by SEP owners.²⁶¹⁹ Namely, even if one SEP is found to be valid and infringed it may stop the sale of the whole product. SEP holders are said to be able to use injunctions, or even the threat of injunctions, to force implementers to accept excessive holdup licensing terms. Accordingly, many argue that injunctions for SEPs should not be available in principle,²⁶²⁰ and the only remedy in SEP cases should be the award of FRAND damages.²⁶²¹ Others, however, fear that prohibiting injunctive relief will open the door for opportunistic behaviour of standard implementers i.e. 'holdout'.²⁶²² Namely, injunctions are seen as the tool to bring imple-

menters back to the negotiation table.²⁶²³ Otherwise, implementers may decide to behave opportunistically and use the strategy of systematically infringing patents, waiting to be sued by SEP holders and litigate the validity of each and every patent in the portfolio. Such strategy may lead SEP owners to settle for below FRAND royalties, hampering further incentives to innovate in standardisation.

Having said that, getting an injunction for SEPs is not an easy task and the availability of injunctions has been restricted both in the EU and the US. The EU used competition law for restricting the availability of injunctions, while the same effect in the US was realised by patent law remedies. The next paragraphs will briefly describe EU and US approaches.

The fear of dangerous patent holdup has led the European Commission to intervene in two cases concerning Motorola and Samsung in their 'smartphone patent wars' against Apple.²⁶²⁴ The first decision emerged from Motorola's dispute against Apple in Germany. Motorola asserted certain patents essential to 3G telecommunications standard against Apple's products in Germany. The parties could not agree on licensing terms, and Apple made several licensing proposals. A second licensing offer left the determination of the royalty rate to Motorola's equitable discretion, provided for the payment of a provisional royalty into an escrow account and included a withdrawal of all pending validity challenges to Motorola's SEPs. That offer was considered as inadequate, as it did not include a termination clause in case of the future challenge of Motorola's SEPs and acknowledgment of past damages above FRAND rates. After the injunction was granted and Motorola posted a security for its enforcement, Apple sent final proposal accepting Motorola's demands. Karlsruhe Appeal Court deemed such offer sufficient and declared injunctions moot.²⁶²⁵

The Commission, however, concluded that Apple was acting as a willing licensee as of the second offer. Not accepting termination clause and not agreeing on past damages above FRAND rates does not represent unwillingness to license. Thus, the Commission held that Motorola abused its dominant position by seeking and enforcing injunctions on its FRAND committed SEPs against Apple, a willing licensee. The Commission, however, decided not to impose any fines because there was no EU case law regulating these issues and the national courts have reached diverging conclusions.²⁶²⁶

The second case concerned Samsung's injunction requests against Apple before courts in France, Germany, Italy, the Netherlands and the UK, on the basis of certain of its

UMTS SEPs.²⁶²⁷ Samsung later unilaterally withdrew these actions.²⁶²⁸ The Commission nevertheless continued with the investigation as it was concerned that Samsung might continue seeking injunctions on its SEPs in the future. The case ended with commitments decision whereby Samsung committed not to seek injunctions against potential licensees who sign up to a specified licensing framework. Under this framework, Samsung committed to approach the prospective licensee and start with the negotiation process, which may last up to 12 months. If no agreement is reached, parties shall seek a determination of FRAND terms by the court or, if both parties agree, arbitration.²⁶²⁹

There are several characteristics of the Commission's intervention. First, the Commission introduced a novel type of abuse that did not exist before i.e. asking a court for remedy for patent infringement.²⁶³⁰ It is not uncommon for the Commission or the European Courts to uncover new forms of abuse. Indeed, it is long standing principle of EU competition law that dominant undertakings are prohibited from engaging in the competition 'outside of the scope of the competition on the merits'.²⁶³¹ There is no exhaustive list of what acts or practices are outside the scope of the competition on the merits, and the Commission traditionally used this provision to catch novel acts and practices that have anticompetitive effects on the market.²⁶³²

In *Motorola*, the Commission relied on the past cases concerning the refusal to license IP rights where it was established that the exercise of IP rights may, in exceptional circumstances, amount to an abuse.²⁶³³ The list of 'exceptional circumstances' when the exercise of IP rights may be limited is not exhaustive. Against this background, the Commission extended the case law on refusal to license IP rights to seeking injunctions for enforcement of patent rights. The Commission emphasised that SEP holder, like any other patent holder, is generally entitled to seek and enforce injunctions as part of the exercise of its IP rights.²⁶³⁴ However, the exceptional circumstances of this case being the participation in the standard-setting process within an SSO (ETSI) and commitment

to licence on FRAND terms, justify the limitation on SEP holders' right to seek and enforce injunctive relief.²⁶³⁵

The Commission justified competition law intervention by the need to prevent patent holdup, holding that its decision "promotes the proper functioning of standard-setting by ensuring the accessibility of the technology ... and by preventing hold-up".²⁶³⁶ Another reason for Commission's interventions was that national courts came to different standards for assessing injunctions for SEPs, and it wanted to establish an EU-wide framework.

Finally, the Commission established that seeking an injunction for infringement of FRAND committed SEPs is an automatic abuse of dominant position. Put differently, the Commission held that by going to court and asking injunction, the SEP holder abuses its dominant position and the burden of proof is on the SEP holder to justify its behaviour.²⁶³⁷ According to the Commission, the SEP may seek injunction only if proves that the infringer: i) is in financial distress and unable to pay its debts; ii) has assets that are located in jurisdictions that do not provide for adequate means of enforcement of damages; iii) is unwilling to enter into a licence agreement on FRAND terms,²⁶³⁸ or iv) is seeking injunctive relief with respect to its own SEPs.²⁶³⁹ According to the Commission, the infringer can always escape injunctions and prove it is willing to license if it agrees with the court or arbitration determination of FRAND terms and accepts to be bound by such determination.²⁶⁴⁰ Also, challenging the validity, essentiality and infringement of SEPs is not considered as unwillingness to license on the part of the implementers.²⁶⁴¹

During the Commission's investigation of Motorola and Samsung, a dispute arose before the Dusseldorf Regional Court between Huawei and ZTE. Huawei held SEPs for the 4G LTE standard which it committed to licence on FRAND terms. It offered a license to ZTE, and after several months of unsuccessful negotiations, Huawei initiated infringement proceedings seeking, among other things, an injunction prohibiting infringement and the recall of products.²⁶⁴² The Dusseldorf Regional Court decided to stay proceedings and refer questions to the European Court of Justice whether, and under what conditions, seeking injunctions for SEPs could represent an abuse of dominant position.

The ECJ confirmed that seeking injunctions by SEP holder may, under certain circumstances, represent an abuse of dominant position. It reiterated that the enforcement of IP rights might in exceptional circumstances amount to an infringement of Article 102 TFEU. The facts that the patent is essential to a standard adopted by the SSO, and SEP

holder's FRAND commitment, create exceptional circumstances justifying the limitation on the exercise of intellectual property rights.²⁶⁴³ Unlike the Commission, however, the ECJ was more neutral and imposed obligations on both parties. It held that it would not be an abuse of dominant position if the SEP holder complies with the following steps:

- (i) before seeking an injunction, the SEP holder must approach and notify the implementer about infringement and designate specific SEPs that are infringed and the way they are infringed;²⁶⁴⁴
- (ii) the infringer should express its willingness to conclude the licensing agreement;²⁶⁴⁵
- (iii) the SEP holder should then provide the specific, written offer for a license on FRAND terms, specifying, in particular, the amount of the royalty and the way in which is to be calculated;²⁶⁴⁶
- (iv) Infringer must then diligently and in good faith respond to the offer, without any delaying tactics. If the infringer does not accept, it must submit promptly and in writing his FRAND counter-offer;²⁶⁴⁷
- (v) If the SEP holder rejects the counter-offer, the infringer must provide appropriate security (for example, by providing a bank guarantee or placing necessary amounts on deposit) and render accounts;²⁶⁴⁸
- (vi) At that point, the parties may by common agreement request the FRAND royalty to be determined by an independent third party (presumably court or arbitration).²⁶⁴⁹

Therefore, in the EU the availability of injunctions for SEPs is constrained by competition law. Further application of *Huawei v ZTE* framework remains on national courts who are carefully examining *Huawei* criteria before deciding whether to grant injunctions or not.²⁶⁵⁰

In the US, injunctions for SEPs have been limited primarily via patent law. US courts have used traditional principles of equity to deny injunctive relief to SEP holders. US Patent Act provides that a permanent injunction "may" be granted "in accordance with the principles of equity, on such terms as the court deems reasonable".²⁶⁵¹ The decision to grant or deny an injunction is at the discretion of US district courts, reviewable on appeal only for abuse of discretion. In 2006, the Supreme Court held in *eBay v MercExchange*²⁶⁵² that,

2652 *eBay Inc. v. MercExchange, L.L.C.*, 547 U.S. 388 (2006).

to obtain injunction, patent holder must prove the following four requirements: i) that it has suffered an irreparable injury; (ii) that remedies available at law, such as monetary damages, are inadequate to compensate for that injury; (iii) that, considering the balance of hardships between the plaintiff and defendant, a remedy in equity is warranted; and (iv) that the public interest would not be disserved by a permanent injunction.²⁶⁵³

The *eBay* test equally applies to SEP cases as well.²⁶⁵⁴ It is extremely difficult for SEP holder to satisfy *eBay* criteria and, to date, no permanent injunction was issued for infringement of FRAND committed SEP.²⁶⁵⁵ Injunctions were typically denied because it could not be established that patentee would suffer irreparable harm and that damages would not provide sufficient compensation.²⁶⁵⁶ For example, in *Apple v Motorola* the Federal Circuit held that: "Considering the large number of industry participants that are already using [Motorola's patent], including competitors, Motorola has not provided any evidence that adding one more user would create [irreparable] harm."²⁶⁵⁷ The court also noted that many other licenses that Motorola concluded regarding the SEP in questions, "strongly suggest that money damages are adequate to fully Motorola compensate for any infringement".²⁶⁵⁸ Similarly in *Microsoft v Motorola*,²⁶⁵⁹ the court held that Motorola failed to demonstrate that it will suffer irreparable harm absent injunction because Microsoft committed to accepting a license on FRAND terms for Motorola's SEP portfolio, the litigation is continuing to determine the details of such a license, and at some point in the future, either by agreement of the parties or by court adjudication, a license agreement will become a reality.²⁶⁶⁰ The impending license agreement would also provide an adequately remedy to Motorola as a matter of law, instead of an injunction.²⁶⁶¹

Finally, the The US Federal Trade Commission (FTC) investigated two cases where SEP holders requested injunctions as a standalone violation of Section 5 of the FTC Act. i.e. an unfair method of competition and unfair acts or practices. The first case concerned Bosch's proposed merger with a company SPX Services that held certain SEPs related to air conditioning equipment standards, which it committed to license on FRAND terms and sought injunctions against implementers of respective equipment.²⁶⁶² The second case concerned Motorola's request for injunctions and exclusion orders before courts

and the ITC against Microsoft and Apple.²⁶⁶³

In the view of the FTC, seeking injunctive relief against a 'willing licensee' is incompatible with FRAND commitment, as it may allow the SEP holder engage in patent holdup and obtain unreasonable licensing terms.²⁶⁶⁴ It held that "negotiation that occurs under threat of an injunction may be weighted heavily in favour of the patentee in a way that is in tension with the[F]RAND commitment."²⁶⁶⁵

The FTC held that SEP holders may only seek injunctions if the implementer: i) is not subject to United States jurisdiction; ii) has stated in writing or in sworn testimony that it will not accept a license on any terms; iii) refuses to enter a license agreement determined by court or arbitration; iv) files a claim for injunctive relief against SEP holder for its own FRAND SEPs; v) fails to assure that it is willing to accept a license on FRAND terms, or vi) a court determined that implementer used SEP for purposes other than implementing the standard.²⁶⁶⁶

However, both cases were concluded with consent orders, which do not represent an admission of liability or a binding legal precedent, and the position of the FTC remains untested at courts. Nevertheless, it signals the position of the FTC to view the mere seeking of injunctions by SEP holders as a violation of Section 5 of the FTC Act.

In conclusion, injunctions for SEPs do not follow automatically and courts have been cautious in granting this type of remedy. As seen, EU and US used different legal mechanisms to achieve the same effect. In the EU, competition law primarily governs the availability of injunctions for SEPs, while in the US patent law doctrines impose restricting in awarding injunctions.

10.7.3.2. Refusal to license to upstream competitors (chip level licensing)

Another potentially anti-competitive practice is a refusal by the SEP owner to license upstream, to chip manufacturers, but licenses only to final downstream device manufacturers. Under one view, components best reflect the value of the standardised technology and, therefore, licences should be concluded with component manufacturers (license to all approach).²⁶⁶⁷ Basing royalties on end-products is likened to a tax on innovation that inappropriately overcompensates SEP holders for the value of other downstream technology and components unrelated to the standardised technology.²⁶⁶⁸ Accordingly, the SEP owner cannot refuse to license its SEPs to chip manufacturers, if they so request.

(2015) 1, CPI Antitrust Chronicles 1.

²⁶⁶⁸ See Fair Standards Alliance, 'Position Paper- SEP Licenses Available to All' (24 June 2016) p. 4.

On the other hand, others argue the ordinary industry practice is to license at the final downstream product level, that no company has been denied access to standardised technology and no company wanting to sell components to downstream manufacturers has been prevented from doing so.²⁶⁶⁹ Moreover, it is said that the end-device accurately reflects the true value of the standardised technology as the value of the standard is fully realised in the end-product device, not on the chip physically implementing it.²⁶⁷⁰ Under this approach, access to all companies wanting to implement the standard is granted (access to all), while SEP holders only chose the level of the supply chain for concluding licenses without prohibiting the use of standard by anybody else in the production chain.

Refusal to license to all is still an unexplored area of competition law in SEP cases. The FTC brought a case against Qualcomm in January 2017 alleging, among others, a violation of Section 2 of the Sherman Act for refusing to license SEPs to competing chip manufacturers.²⁶⁷¹ According to FTC, “Qualcomm’s refusal to license competing manufacturers of [modem chips], in contravention of its FRAND commitments, contributes to [Qualcomm’s] ability to tax its competitors’ [modem chip] sales, and thus maintain Qualcomm’s modem chip monopoly.”²⁶⁷² In 2018 the district court judge ruled that Qualcomm had a *contractual* duty to license to component manufacturers arising out of its FRAND commitment given to standard-setting organisations ATIS and TTA.²⁶⁷³ Finally, in 2019 judge ruled that Qualcomm also has an *antitrust* duty to license to all.²⁶⁷⁴ The judge applied seldom used *Aspen Skiing* test which prohibits refusal to deal with competitors when three requirements are met: i) unilateral termination of a voluntary and profitable course of dealing; ii) refusal to deal even if compensated at retail price, which suggested that the conduct was anticompetitive; iii) refusal to provide its competitor a product that was already sold in a retail market to other customers.²⁶⁷⁵ In this case, district court judge considered that all three criteria have been fulfilled as Qualcomm historically used to license component manufacturers which it terminated in order to extract unreasonably high royalties from end-device manufacturers.²⁶⁷⁶ The case, however, is criticised for relying too much on past historical information that may not be adequate for changed industry environment, that it does not take into account the basic principles of patent law that the patentee is free to decide at which production chain to license its technology and disregards incentives to innovate in the future.²⁶⁷⁷ The case is currently under appeal and it remains to be seen what will be the final US word in this regards.

10.7.3.3. Excessive non-FRAND royalties

Finally, there are debates whether competition can or should apply to SEP owners who offer excessive non-FRAND licensing terms. The potential of applying competition law to non-FRAND royalties depends on the suitability of existing competition law doctrines. Namely, EU competition law prohibits dominant companies from imposing excessive and discriminatory prices defined as those that “have no reasonable relation to the economic value.”²⁶⁷⁸ The legal test for proving excessive prices requires, first, determining whether the difference between the costs actually incurred and the price actually charged is excessive.²⁶⁷⁹ If the answer is affirmative, then it must be established whether the price is unfair in itself or when compared to competing products.²⁶⁸⁰ However, applying the legal test for determining excessive prices to concrete example of SEP royalties is not an easy task.

The difficulty in applying Article 102 TFEU to excessive non-FRAND royalties was apparent in two cases investigated by that the European Commission. In the *Rambus* case, the European Commission challenged the imposition of royalties for the use of SEPs that were considered as excessive.²⁶⁸¹ Rambus’ conduct consisted of a “patent ambush”, intentional deception of the SSO by concealing the existence of patents and patent applications during the development of a standard and later, once its technology has been adopted into the standard, claiming unreasonably high royalties.²⁶⁸² Thus, because of a patent ambush, Rambus managed to avoid giving a FRAND commitment and charge unconstrained royalties for the use of its SEPs.

The European Commission also investigated whether Qualcomm was charging non-FRAND terms for the use of its SEPs, contrary to Article 102 TFEU.²⁶⁸³ Qualcomm participated in the standardisation process and committed to license its SEPs for WCDMA standard on FRAND terms. Later, complainants alleged that Qualcomm failed to comply with its FRAND licensing commitment. In opening the investigation, the European Commission stated that it would evaluate whether Qualcomm’s breach of FRAND commitment consisted in an abuse of dominant position. In the words of the European Commission: “a finding of exploitative practices by Qualcomm in the WCDMA licensing market contrary to Article [102] of the EC Treaty may depend on whether the licensing terms imposed by Qualcomm are in breach of its FRAND commitment.”²⁶⁸⁴

However, neither investigation resulted in definite finding of the abuse of dominant position. The *Rambus* case was closed with a commitments decision, where Rambus undertook to lower its royalties, but did not determine whether the challenged conduct

2684 Ibid.

represented an abuse of dominant position.²⁶⁸⁵ The investigation of Qualcomm was terminated after complainants withdrew their claims.²⁶⁸⁶ Therefore, the results of European Commission's investigations demonstrates the difficulties in linking the breach of FRAND commitment with the competition law notions of excessive royalties.

The US antitrust law, on the other hand, does not prohibit the imposition of excessive prices. The US Supreme Court even held that: "charging of monopoly prices, is not only not unlawful, but it is important element of free market system. The opportunity to charge monopoly prices, at least for a short period of time, is what attracts business acumen in the first place, it induces risk taking that product innovation and economic growth."²⁶⁸⁷ Therefore, charging excessive non-FRAND royalties as such is not actionable antitrust conduct in the US. The US antitrust law is concerned with the illegitimate obtainment or maintenance of monopoly power, and not how legitimate monopolist should use its monopoly power. Section 2 of the Sherman Act makes it unlawful to "monopolize, or attempt to monopolize ... any part of the trade or commerce among the several States."²⁶⁸⁸ To prevail on a claim for monopolization or attempted monopolization, the plaintiff must prove that the defendant had power in the relevant market and wilfully sought, acquired, or maintained that power in an unlawful manner.²⁶⁸⁹

Accordingly, in order to catch the imposition of non-FRAND royalties as an antitrust offence, antitrust claims were focused on the fact that SEP holder *deceived* SSO in order to *unlawfully* acquire monopoly power. In *Broadcom v Qualcomm*,²⁶⁹⁰ Broadcom alleged that Qualcomm deceived SSO to include its SEPs into the standard by falsely promising to license its patents on FRAND terms, and then breached such promise by licensing its technology on non-FRAND terms. The Third Circuit held that for the violation of Section 2 of the Sherman Act it has to be proven that: i) the SEP holder intentionally falsely promised to license its SEPs on FRAND terms, ii) the SSO's reliance on that promise when including the technology in a standard, and iii) the patent holder's subsequent breach of that promise.²⁶⁹¹ Only then would the conduct represent unlawful acquisition of monopoly power. This is not an easy test to prove and no court to date has definitively established the violation of Section 2 of Sherman Act for mere breach of FRAND royalty terms.

Therefore, the mere breach of FRAND commitment is thus not an actionable antitrust conduct in the US.²⁶⁹² At least one US court explicitly confirmed this finding. In *TCL v Ericsson*

2685 Commission, 'Antitrust: Commission accepts commitments from Rambus lowering memory chip royalty rates' IP/09/189 (2009) (Rambus agreed to charge zero royalties for the SDR and DDR chip standards that were adopted when Rambus was a JEDEC member, and a maximum royalty rate of 1.5% for the later generations of JEDEC DRAM standards, instead of 3.5% that Rambus was previously charging).

son the court held that: “the crux of TCL’s argument seems to be that because TCL has evidence that Ericsson has breached FRAND, TCL has evidence that Ericsson has necessarily done so in an anticompetitive way ... The Court has not been provided with any authority for this kind of bootstrapping of a breach of contract case, without more, into a violation of the policy or spirit of antitrust laws. Instead ... it is clear that there needs to be some other conduct by Ericsson than mere breach of its FRAND obligations.”²⁶⁹³ The US DOJ’s Assistant Attorney General for Antitrust Division Makan Delrahim, in a number of speeches, similarly emphasised current DOJ’s view that antitrust law should not be used to police mere breaches of FRAND commitments, and that remedies available in contract law or other legal disciplines are more adequate in that regard.²⁶⁹⁴

10.7.4. Comparative analysis of unilateral exclusionary and exploitative practices relating to IoT and standards: a BRICS’ perspective

10.7.4.1. Injunctions

10.7.4.1.1. Brazil

The Brazilian experience regarding FRAND injunctions is incipient. At the antitrust enforcement level, CADE (the Brazilian competition authority), as did the American courts, analysed the case between TCT and Ericsson and reached a similar conclusion.²⁶⁹⁵

The Brazilian case was initiated due to a complaint filed by TCT against Ericsson, in which it argued that Ericsson was employing exploitative practices relating to intellectual property, imposing unreasonable negotiation conditions and sham litigation. The last practice was related to many requests for judicial injunctions that Ericsson filed against TCT. In TCT’s views, such request for injunctions were baseless and had as only goal to force TCT to accept discriminatory contractual provisions.

In its decision, CADE’s General-Superintendence issued an opinion for the dismissal of the case. According to its reasoning, the debate regarding business conditions, including the value of royalties, was a private matter between two market players and did not fall within CADE’s jurisdiction. Moreover, the General-Superintendence did not find the injunction requests filed by Ericsson as baseless and thus could not characterize sham litigation.

The Brazilian decision has points of convergence with the decision rendered by the DoJ Antitrust Division, to the extent that both authorities concluded that the antitrust field is not the most adequate for disputes regarding royalty and FRAND issues.

10.7.4.1.2. Russia

As regards Russian experience in the field of FRAND royalty, Russia's case law has no record of examining these issues as of now.

10.7.4.1.3. India

Over the last five years, the Competition Commission of India (CCI) and the Delhi High Court have tussled over defining the nascent jurisprudence of FRAND licensing terms in India. Both bodies have passed several interim orders (all involving the same SEP holder, Ericsson), which suggest opposing views on the balance of interests between essential technology contributors and technology users.

The Delhi High Court has confirmed the right of an SEP holder to obtain an injunction is coterminous with the issuance of SEPs on FRAND terms. Without determining the actual royalty base for SEPs, the High Court has, in several cases, based upon royalty payments made to comparable third-party licenses, ordered interim payments to SEP holders. These orders have been granted under the Indian Patents Act, 1970 (Patents Act). The High Court has also held that SEP holders are free to charge royalty rates based on the price of the downstream product, where the SEP technology is being used.

In contrast, CCI, India's competition law regulator, has adopted a stricter approach towards licensing practices of SEPs, under the [Indian] Competition Act, 2003 (Competition Act). CCI, under India's competition law regime, has *prima facie*, held that an SEP holder's charging of royalties based upon the price of a downstream product is discriminatory and amount to an abuse of a dominant position under section 4 of the Competition Act. Further, the use of non-disclosure agreements by SEP holders, was *prima facie* held as indication that an SEP holder is charging different royalty rates to different licensees in violation of its FRAND commitments. Under the enforcement scheme of the Competition Act, such *prima facie* finding is then investigated by the Office of the Director General (DG), CCI's own investigative arm. The findings of the DG are then reported back to the CCI, which then passes its final decision. As of May 2019, CCI has not adopted a final decision on either: basing royalty rates on price of downstream products or the use of non-disclosure agreements violates India's competition laws.

10.7.4.1.4. China

China is often one of the major battlefields where SEP holders are wrestling with licensees by seeking injunctive reliefs. This issue is touched by Chinese courts and antitrust agencies in various proceedings. In this regard, Chinese authorities and courts stress that the license negotiation must be under FRAND terms. That said, compared to the established precedents in the U.S. and Germany, Chinese courts seems to attach more importance to the subjective attitude of the SEP holder and licensee when evaluating whether to grant an injunctive relief. In essence, the Chinese courts require both parties to negotiate under a clear FRAND term. The courts will find out whose fault has led

to the failure of FRAND negotiation so as to determine whether to grant an injunction.

In 2013, Guangdong High Court ruled down an eye-catching antitrust case between InterDigital Corporation (IDC) and Huawei. IDC, the SEP holder was found to have abused its market dominance through various means, including unfairly seeking for injunctive relief to force Huawei, the licensee, to accept more onerous terms. The High Court held that IDC's action in other jurisdictions to sought for injunctive relief is unlawful as Huawei had expressed its willingness to negotiate with IDC to obtain the license.

The *Huawei v. IDC* case left the commentators with the impression that the Chinese court adopted a pro-implementor approach. Such approach was later reinforced by the Chinese antitrust watchdog's fine against Qualcomm. This idea is later adopted as a general rule. The Supreme Court of China (SPC) clarified in 2016 that injunctive relief is unavailable for an unwilling SEP holder against a willing licensee, where the SEP holder deliberately avoids its FRAND obligations, causing delay or failure to reach a licensing agreement.²⁶⁹⁶

However, it is unfair to label the SPC's approach as a total "pro-licensee" one as it also requires that the accused infringer (i.e., the implementor) shall have no apparent fault for the failure. While provided a general high threshold on FRAND-encumbered SEP injunctive reliefs, the SPC left open for many other issues with more complications, such as whether the injunction is available where the SEP holder and the implementer are both negotiating in good faith or both had fault, or under a reverse hold-up setting where the SEP holder was acting in good faith, but the licensee was not.

These points were later addressed by jurisprudence. On March 22, 2017, the Beijing IP Court granted an injunction relief in *Iwncomm vs. Sony*, marking a significant shift in the landslide by granting injunction to the SEP holder, Iwncomm. According to the Beijing IP Court, injunction could be granted to address reverse hold-up when the SEP holder had no fault and the implementer was acting in bad faith. The Court also stated that where both parties have fault to cause the failure of reaching license terms, the court shall weigh and assess the degree of fault of each party to determine whether to grant an injunction. In evaluating the parties' fault, the *Iwncomm vs. Sony* assessed whether the failure of reaching a license was caused by, for example, the SEP holder requesting non-FRAND loyalty fee, or the implementer by hindering or delaying the negotiation process.

Affirming the *Iwncomm vs. Sony* ruling, the Beijing High Court set out further guidance in its *Guidelines for Patent Infringement Determination (2017)* (Beijing Guidelines).²⁶⁹⁷ The Beijing Guidelines further provides that in the case neither party has fault, the implementer can avoid an injunction by deposit with the court an amount of its proposed royalty. This rule is understood to address the prominent concern from SEP holders on reverse hold-up (hold-out). These rules are generally consistent with the EU guidance set out in the by the Court of Justice in *Huawei vs. ZTE* with more clarity on the procedural requirements.

²⁶⁹⁶ Article 24 of the Interpretations (II) of the Supreme People's Court on Several Issues concerning the Application of Law in the Trial of Patent Infringement Dispute Cases (effective as of April 1, 2016)

²⁶⁹⁷ <http://bjgy.chinacourt.gov.cn/article/detail/2017/04/id/2820737.shtml>

According to the Beijing Guidelines, the SEP holder shall observe its FRAND commitment, several check-points are provided in this regard:

1. The SEP holder shall notify the implementor in writing of alleged patent infringement, including the asserted SEPs and how the SEPs has been infringed by the implementer;
2. The SEP holder shall provide information of SEPs (illustrative patent list) and proposed FRAND terms after the implementer has expressed its willingness to take a FRAND license, and allow the implementer to response within a reasonable timeframe conforming to business or trading practice;
3. The SEP holder shall act in good faith in negotiating with the implementer, including not to offer unreasonable terms and not to hinder or discontinue negotiation without justifiable grounds.

On the other hand, an implementer shall satisfy the following checklist to qualify as in good-faith:

1. To timely respond to the SEP holder's infringement notice within a reasonable timeframe;
2. To either accept or reject with a counter offer within a reasonable timeframe upon receipt of the SEP holder's license proposal;
3. To act in good-faith in negotiating with the SEP holder, including not to offer unreasonable terms and not to hinder or discontinue negotiation without justifiable grounds.

Though the *lnncomm vs. Sony* and the Beijing Guidelines are not binding on courts in other areas of China, the methodology appears to be adopted by other later rulings. Such as the Shenzhen Court's ruling over *Huawei vs. Samsung*.

As the most recent development on the injunctive relief issue, the Guangdong High Court issued its *Working Guidelines on the Trial of Standard Essential Patents Disputes* (Guangdong Guidelines). The substance of the Guangdong Guidelines is consistent with the Beijing Guidelines, which reaffirm and summarise the fault-based test for injunctive relief. Below is a table summarising the substantive rules set out by the Guangdong Guidelines:

Is the SEP holder at default	Is the SEP implementer at default	Is an injunctive relief available to the SEP holder?	Further factors to evaluate
Yes	No	No	N/A
No	Yes	Maybe	

Is the SEP holder at default	Is the SEP implementer at default	Is an injunctive relief available to the SEP holder?	Further factors to evaluate
Yes	Yes	Maybe	<ul style="list-style-type: none"> • The gravity comparison of the fault by the holder and the implementer; • Remedial actions taken; • Impact on the negotiation process; • Causation between the fault and breakdown of negotiations
No	No	No	Provided that the SEP implementer timely provides a sufficient deposit.

On the enforcement side, the authorities similarly affirmed the general idea that injunction may be a vehicle for patent holders to abuse their FRAND-encumbered patents. The merger review regulator, then MOFCOM, explicitly required in *Nokia/Microsoft* that the SEP holder should not prevent the implementation of its SEPs by filing an injunction, unless the licensor provides FRAND terms to the implementer, but the licensee refuses to make a deal. This approach was later reiterated by several other merger clearances.

In the draft *Guidelines for Abuse of IPRs*, the authority listed out factors it put into consideration while evaluating whether seeking for injunctive relief by a SEP holder is deemed as abusive. The factors include: (1) the actual willingness and actions taken by both parties during the course of negotiation; (2) whether the SEP related commitment contemplated with injunctive relief; (3) the licensing conditions provided by both parties; and (4) the impact of injunctive relief on the licensing negotiation, the relevant market, downstream competition and consumer welfare.

As a general observation, the approach adopted by Chinese courts and authorities is closer to that of the German courts and the ECJ's *Huawei vs. ZTE* approach than it is to the US/UK approach affirmed by *TCL vs. Ericsson* and the UK *Unwired Planet* cases.

10.7.4.2. The Determination of FRAND Royalty

10.7.4.2.1. Brazil

No practice currently available in Brazil.

10.7.4.2.2. Russia

No practice currently available in Russia.

10.7.4.2.3. India

10.7.4.2.3.1. Methodology to calculate SEP royalty

The contentious issue at hand is the methodology to calculate the SEP royalty rate but as of May 2019 no Indian court or regulator has set a FRAND royalty rate/base for SEPs. But contrasting jurisprudence has emerged from the interim decisions of the Delhi High Court and CCI. The Delhi High Court has determined that SEP holders are required to be paid by the licensees, during the pending of the legal dispute, and for the purposes of calculating such interim royalty rate, the court looked at similar third-party licenses.

For example, in December 2013, the court ordered Ericsson to produce 26 license agreements that Ericsson had signed with Indian licensees to determine the rate of the interim royalty due to Ericsson, an SEP holder, by Micromax (the largest Indian mobile handsets manufacturer), until the pendency of the trial. Earlier in March 2013, Ericsson sued Micromax for infringing eight of Ericsson's SEP patents in 2G and 3G telecommunications standards,²⁶⁹⁸ seeking damages and a permanent injunction against Micromax. Using these 26 comparable third-party licenses, the High Court set a range of royalties between 0.8 and 1.3 per cent of the sale price of the Micromax's end products where such infringing SEP technology has been used. Therefore, as per the Delhi High Court's decision, the basis of avoiding a permanent injunction would be to deposit such interim royalties, based upon comparable third-party licenses. The court was quick to note that the determination of the interim royalty base was not a determination of FRAND rates for the eight alleged infringing SEPs.

Micromax, during the pendency of its suit against Ericsson before the Delhi High Court, filed a complaint with CCI alleging that Ericsson charges exorbitant royalty rates for its SEPs, and thereby abuses its dominant position under section 4 of the Competition Act.²⁶⁹⁹ Contrary to what the Delhi High Court had held, Micromax alleged that Ericsson charged excessive royalties for its SEPs compared to those charged from other similar patentees. Further, that such royalties being based on the sale price of the downstream Micromax product in which the SEP technology was incorporated, was an abusive market practice. Micromax claimed that the royalty rate should be pegged at the value of the chip-set technology instead. Micromax reasoned that charging of such higher royalty rates would ultimately harm Indian consumers. In addition, the requirement of Ericsson that all current and prospective licensees sign a non-disclosure agreement, was used by Micromax to evidence that Ericsson could discriminate between similarly placed licensees, in violation of its FRAND commitments.

In its preliminary order in November 2013, CCI showed sympathy to such arguments and held that Micromax had established a *prima facie* case of abuse of dominant position by Ericsson and referred the case for further investigation by the DG. CCI delin-

²⁶⁹⁸ Telefonaktiebolaget LM Ericsson v Mercury Electronics & Another (2013) Delhi High Court, Interim Application No. 3825 of 2013, CS(OS) 442 of 2013.

²⁶⁹⁹ Micromax Informatics Ltd. v Telefonaktiebolaget LM Ericsson (2013) Competition Commission of India, Case 50 of 2013.

ated the relevant product market as SEPs that are necessary for mobile devices implementing the GSM standard and delineated India as the relevant geographic market. In such delineated relevant market, CCI found Ericsson to hold the largest SEPs for mobile communications for 2G, 3G and 4G patents for smartphones, tablets, etc, given that Ericsson's technology was the standard without any viable alternatives to prospective licenses. CCI thereafter concluded that in such a relevant market, given Ericsson's large portfolio of SEPs, it was in a dominant position.

CCI in its preliminary order further held that charging a different license fee per unit of a mobile phone for the use of the same technology is *prima facie* discriminatory and contrary to FRAND terms. According to CCI, Ericsson's royalty rates had no linkages to the SEP itself, given that licenses had to pay different royalty rates based on the price of two different downstream products, even if both the products used the same licensed technology. CCI held that such licensing practices reflected an excessive pricing model, and found it *prima facie* problematic under the 'abuse of dominance' provisions of the Competition Act.

Similar to Micromax, Ericsson in March 2015 sued Intex Technologies (Intex) for damages and seeking a permanent injunction for eight alleged infringing SEPs held by Ericsson²⁷⁰⁰. Intex argued that Ericsson's royalty rates were higher than those charged by the SEP holder to Micromax and Gionee, thereby violating the non-discriminatory component of its FRAND commitments. Similar to Micromax, Intex complained about Ericsson's practice of charging royalty rates based on the sale price of the downstream product of the licensee instead basing it upon the price of the chip-set.

The Delhi High Court disagreed with Intex's arguments and observed that the allegation against Ericsson charging Intex a higher royalty rate than those charged to comparable licenses were factually incorrect. The court held that in fact, Ericsson had charged Intex a lower royalty rate for products incorporating its SEPs, when sold within India, than it offered to Micromax and Gionee, and a higher royalty rate only for those of Intex's products which incorporated Ericsson's SEPs, sold outside India.

Further, the High Court, reiterating its earlier stand in the *Micromax* order, noting decisions in the US²⁷⁰¹ and in China²⁷⁰², found that Ericsson's practice of using the net sales price of the downstream mobile phone handset as the appropriate royalty base is lawful was not in violation of Ericsson's FRAND commitments.

Similar to the *Micromax* order, here again the High Court reiterated the importance of being able to calculate interim payments for SEPs by comparing to similar SEP licenses. Given the similarity of the case with the facts of its earlier interim order against Micro-

2700 Telefonaktiebolaget LM Ericsson v Intex Technologies (India) Ltd. (2014) Delhi High Court, Interim Application No. 6735 of 2014, CS (OS) 1045 of 2015.

2701 Commonwealth Scientific & Industrial Research Organisation v Cisco Systems, Inc. (2015) United States Court of Appeals, Federal Circuit, Case No. 2015-1066.

2702 National Development and Reform Commission, 'National Development and Reform Commission's monopolistic behavior of Qualcomm Responsible for rectification and fined 6 billion yuan' (2013) <http://www.ndrc.gov.cn/xwzx/xwfb/201502/t20150210_663822.html>.

max, the court declined to select a different royalty rate for Intex's interim payments to Ericsson. The court set the range of royalties between 0.8 and 1.3 per cent of the sale price of the Intex's end products. The court's approach has been that a proper royalty should reflect the market value of the patented technology as reflected in Ericsson's numerous patent license agreements. Anything less would be discriminatory against existing licensees.

Similar to *Micromax*, Intex filed a complaint against Ericsson before CCI in 2013.²⁷⁰³ Intex alleged that the Ericsson had abused its dominant position by offering to license Intex its SEP technology on exorbitant or excessive royalty rates and has proposed unfair and discriminatory licensing terms in violation of its FRAND commitments. Similar to *Micromax*, Intex argued that Ericsson's requirement of requiring its prospective licensees to sign a non-disclosure agreement further evidenced that Ericsson licenses its SEPs at different royalty rates, with different commercial terms to similarly placed potential licensees, in violation of the non-discriminatory component of its FRAND commitments. Intex argued that the non-disclosure agreements would lead to royalty stacking and patent hold-up, ultimately harming Indian consumers. Intex claimed that the requirement of the non-disclosure agreements requiring Intex to redress its grievances in a foreign forum, i.e., Singapore, rather than local courts amounted to a *judicial predation*.

CCI's interim conclusions in the Intex complaint were similar to those it had for the *Micromax* complaint. CCI held that Intex has been able to successfully establish a *prima facie* case of abuse of dominant position by Ericsson, under section 4 of the Competition Act, and referred the case for further investigation to the DG. CCI reiterated its conclusions in the *Micromax* case that royalties offered to Intex tied with the price of the downstream product had no linkage with the SEPs itself and were *prima facie* discriminatory and in violation of Ericsson's FRAND commitments.

CCI agreed with Intex that Ericsson's non-disclosure agreements and the refusal to share commercial terms fortified Intex's accusation of Ericsson's discriminatory licensing practices. CCI also found sympathy with Intex's arguments that charging different royalty rates based upon the price of Intex's downstream product for the use of the same SEP technology was "excessive pricing" and resulted in high cost of mobile phones. Excessive or unfair pricing and imposing discriminatory commercial terms is a exploitative abusive practice under section 4(2)(a) of the Competition Act.²⁷⁰⁴ CCI also held that imposition of a jurisdiction clause in the non-disclosure agreement that forced Intex to choose a foreign jurisdiction to redress its grievances, evidenced that Ericsson was in a dominant position. CCI's *prima facie* order does not mention under what legal provisions of the Competition Act did it reach such a conclusion.

2703 Intex Technologies (India) Ltd. v Telefonaktiebolaget LM Ericsson (2013) Competition Commission of India, Case 76 of 2013.

2704 The Competition Act 2002, s 4(2)(a) prohibits a firm in a dominant position to: (a) directly or indirectly, imposes unfair or discriminatory—(i) condition in purchase or sale of goods or services; or (ii) price in purchase or sale (including predatory price) of goods or service. Similar to the *Micromax* case, in the Intex case, CCI had determined that Ericsson was in a dominant position in the relevant product market for SEPs necessary for mobile devices that implement the GSM standard in India.

CCI concluded that similar to Micromax, Intex has also established a *prima facie* case against Ericsson of abusing its dominant position by the imposition of excessive royalty rates and discriminatory commercial terms under its restrictive non-disclosure agreements. Thereby, CCI ordered that the DG combine the Intex and Micromax complaints against Ericsson for further investigation.

In May 2015, Best IT World (India) Private Limited (iBall) filed another complaint against Ericsson which was very similar to those of Micromax and Intex²⁷⁰⁵. iBall alleged that Ericsson had imposed strict and onerous licensing conditions for licensing its SEPs, besides requiring that iBall choose Stockholm as the dispute settlement jurisdiction and execute a non-disclosure agreement with a duration of 10 years. In exact similar complaints to those of Micromax and Intex, iBall alleged that Ericsson's charging of royalties based on the sale price of its downstream product and bundling patents irrelevant to iBall's products were in violation of section 4 of the Competition Act. CCI agreed to iBall's arguments and similar to its orders in *Micromax* and *Intex* case, found Ericsson to be in a dominant position in the relevant market for standard essential patents for 2G, 3G and 4G mobile communications standards in India. Similar to its earlier orders, CCI found Ericsson to have *prima facie* abused its dominant position by charging excessive royalty rates based on the price of iBall downstream products and forcing it to execute a non-disclosure agreement was *prima facie* evidence of Ericsson's abusive market behaviour of imposing excessive and unfair royalty rates, contrary to its FRAND commitments. CCI directed the DG to investigate to combine the iBall complaint to those of Micromax and Intex and to submit a combined investigative report. Until May 2019, it is not known if DG has concluded its investigations and submitted its conclusion for CCI's considerations. In November 2015, iBall and Ericsson settled their dispute and negotiated a global license agreement. However, given that CCI's orders are *in rem*, antitrust investigations based upon iBall's original complaint would continue to be investigated by the DG.

Ericsson had brought an infringement suit against Gionee, a Chinese handset manufacturer, for infringing the same eight SEPs that Ericsson had asserted against Micromax and Intex.²⁷⁰⁶ The court calculated Gionee's interim royalty payment obligations with a specific reference to the interim royalties that the court had ordered Micromax to pay earlier. It ordered Gionee to deposit interim royalty payments ranged between 1.25 and 2 per cent of the sale price of Gionee's products using Ericsson's alleged infringing SEPs. The High Court stuck to its earlier methodology of calculating interim royalties based upon the price of the downstream product using the infringing technology.

Two major sets of interim conclusions emerge from the preliminary decisions of the Delhi High Court and CCI. While the Delhi High Court agrees that the methodology of calculating interim royalties, during the pendency of the suit, is to look at comparable

2705 Best IT World (India) Private Ltd. v Telefonaktiebolaget LM Ericsson (2015) Competition Commission of India, Case 4 of 2015.

2706 Telefonaktiebolaget LM Ericsson v Gionee Communication Equipment Co. Ltd & Another (2013) Delhi High Court, Interim Application No. 17578 of 2013, CS (OS) 2010 of 2013.

licenses and also finds a royalty base linked with the price of the downstream product incorporating the licensed technology as FRAND compliant, CCI takes an entire different view in its *prima facie* orders. CCI has found that such a royalty base which has no connection with the value of the licensed technology is unfair and amounts to excessive royalties. Further, the use of non-disclosure agreements has also been considered by CCI as evidencing potential antitrust violation.

It is important to consider these different legal viewpoints. In my opinion, the Delhi High Court reasoned that the retail value of a multi-component product, like a mobile phone, is derived from the combinatorial interaction of its multiple component parts – each generating complementarity effects, enhancing the value of the final product. Thus the value of each component should reflect the complementarity effects created by the interaction of such components with other technologies embedded in the standard and transcend the mere arithmetic sum of the value of the individual components themselves. Such a royalty base also factors the opportunity costs incurred by the SEP holder in licensing an SEP rather than manufacturing the downstream product itself.

CCI's interim orders neglects to consider practical business realities of patent licensing negotiations, holding that execution of a non-disclosure agreement – to protect the SEP holder's proprietary information – was discriminatory and evidenced Ericsson's anti-FRAND licensing practices. Fortunately, the Delhi High Court in its interim orders has differed from CCI's aberrative legal reasoning, holding that a non-disclosure agreement was a pre-requisite in every licensing deal and especially in patent licensing negotiations.

Moreover, CCI failed to examine if the FRAND complaints against Ericsson were being brought about without an attempt on part of the complainants to negotiate a FRAND license in good faith. The licensees while pretending to continue FRAND negotiations with Ericsson had initiated retaliatory proceedings before CCI and other IPR related regulatory authorities to gain leverage in negotiations. The Delhi High Court found the licensees to be acting in bad faith, evidencing an unwillingness to negotiate a FRAND license before commencing the commercial exploitation of Ericsson's SEPs. The court following judicial trends of US and European courts held that SEP royalty rates required good-faith negotiations between the licensees and the SEP holder and has permitted Ericsson interim injunctory relief in almost all proceedings initiated against it.

The fact that CCI's interim injunction accommodates retaliatory tactics of SEP users who have consistently and in bad faith rejected FRAND terms, could have a chilling effect on the incentive of a SEP holder to innovate. If the only means available to an SEP holder (to compel an SEP user to accept to take a FRAND license) is to seek an injunction against the unauthorised and illegal commercial exploitation of an SEP and run the concomitant risk of being found to abuse a dominant position with the ensuing risk of potentially large antitrust fines, it will deter SEP holders from seeking such injunctory relief, diminishing the value of their patents and their incentive to innovate. This blurring of lines between legitimate litigation strategies of an SEP holder and anti-competitive market behaviour can negatively affect how SEP holders will choose to participate in the Indian

technology markets, affecting innovation and growth of the industry, especially that of India's telecommunication industry.

10.7.4.2.3.2. CCI's Jurisdiction to review FRAND violations

Ericsson challenged CCI's jurisdiction to investigate the company's SEP licensing practices before the Delhi High Court in 2014.²⁷⁰⁷ Ericsson claimed that the dispute was essentially a patent dispute, and that the Patents Act provided the remedy of compulsory licensing and that it provides for adequate mechanism to balance the rights of the patentee and other stakeholders.

The Delhi High Court was concerned with the detailed conclusions reached by CCI in its *prima facie* orders. The court was concerned that in reaching such detailed conclusions, CCI had acted beyond the scope of section 26(1) of the Competition Act, which allows CCI to form a *prima facie* opinion, to cause a further investigation of the complaint by the DG, but does not allow CCI to examine merits of the allegations.

The Delhi High Court finally dismissed Ericsson's jurisdictional challenges on the ground that the remedies for abuse of patent rights provided under the Patents Act and those under the Competition Act are different in nature. While the Patents Act, while providing a remedy of compulsory licensing, provides a remedy *in personam*, the remedies available under section 27 of the Competition Act, including monetary penalties and cease-and-desist orders, were remedies *in rem*. Thus, the court concluded that the remedies under the two legislations were not irreconcilably inconsistent, as claimed by Ericsson, and that simultaneous legal proceedings under both the legislations are not mutually exclusive.

Ericsson had also raised an objection to CCI's jurisdiction on the ground that there was no *prima facie* abuse of dominance as Ericsson was exercising its legitimate rights as a patent holder. The Court extensively referred to US cases like *Rambus Inc.*²⁷⁰⁸ (FTC 2006) and EU cases such as *Motorola*²⁷⁰⁹, *Huawei Ltd. v ZTE*²⁷¹⁰ to conclude that the pressure of legal proceedings, filing of an injunction, could give rise to abuse of dominance and CCI has legitimate jurisdiction to review such a violation under section 4 of the Competition Act. The Delhi High Court noted:

"In view of the aforesaid, there is good ground to hold that seeking injunctive reliefs by an SEP holder in certain circumstances may amount to abuse of its dominant position. The rationale for this is that the risk of suffering injunctions would in certain circumstances, clearly exert undue pressure on an implementer and thus, place him in a disadvantageous bargaining position vis-a-vis an SEP holder. A patent holder has a statutory right to file a suit for infringement; but as stated earlier, the Competition Act is not concerned with rights of a person or an enterprise but

2707 Telefonaktiebolaget LM Ericsson v Competition Commission of India (2014) Delhi High Court, W.P. (C) 1006 of 2014.

2708 Rambus Inc. (2006) Federal Trade Commission 142 FTC 98.

2709 Case AT. 39985 Motorola—Enforcement of GPRS SEPs (2014) OJ 344.

2710 Case C-170/13 Huawei Technologies Co. Ltd v ZTE Corp. EU:C:2015:477.

the exercise of such rights. The position of a proprietor of an SEP cannot be equated with a proprietor of a patent which is not essential to an industry standard. While in the former case, a non-infringing patent is not available to a dealer/manufacturer; in the latter case, the dealer/manufacturer may have other non-infringing options. It is, thus, essential that bargaining power of a dealer/manufacturer implementing the standard be protected and preserved.”²⁷¹¹

The Delhi High Court noted that Ericsson, besides suing Micromax and Intex for infringement and damages, had also allegedly threatened Micromax with complaints to Securities Exchange Board of India (SEBI), India’s capital markets regulator, while Micromax was in the process of seeking SEBI’s permission to float a public offer of its shares. The court concluded that such conduct, if found to be true, being directed towards an SEP licensee to accept non-FRAND terms, would amount to an abuse of dominance.

It was widely reported in March 2018²⁷¹² that Micromax and Ericsson had signed a global patent license and Micromax has written to CCI, withdrawing its earlier complaint. However, as mentioned earlier, CCI’s jurisdiction is a jurisdiction *in rem*, and such withdrawal does not obligate CCI to dismiss its investigations into alleged market abusive practices of Ericsson.

10.7.4.2.4. China

As we have discussed in the injunctive relief study, the Chinese authorities and courts have addressed the SEP pricing issue in several occasions. Amongst the established judicial decisions and enforcement cases, *Huawei vs. InterDigital* and *Qualcomm* are most significant ones setting legal tests and precedents. The approach adopted by these cases was then incorporated by the draft IP antitrust guidelines.

10.7.4.2.4.1. Huawei v InterDigital case

In October 2013, the Guangdong High Court, in its capacity as the appellate court, ruled on the two lawsuits brought against InterDigital by Huawei in parallel in 2011.

InterDigital, the American company which designs and develops advanced technologies for wireless communications filed a patent infringement complaint against Huawei to the United States International Trade Commission, and brought a parallel lawsuit in a United States District Court in July 2011.²⁷¹³ In December 2011, Huawei, in turn, filed two complaints based on different causes of action against InterDigital before the Shenzhen Intermediate People’s Court.²⁷¹⁴

2713 *InterDigital Communications LLC et al. v. Huawei Technologies Co. Ltd. et al.*, No. 1:11-cv-00654 (D.Del. 2011).

2714 *Shen Zhong Fa Min Chu Zi*, No. 857 and (2011); and *Shen Zhong Fa Min Chu Zi*, No. 858 (2011).

In one case, Huawei claimed that InterDigital had charged excessive royalties in violation of the FRAND obligation InterDigital bore as the SEP owner, and, on this basis, it requested the court to lower the royalty rate.²⁷¹⁵ In the other case, Huawei submitted that InterDigital had engaged in an abuse of a dominant position by imposing excessive royalties, discriminatory licensing terms and unreasonable licensing conditions, by tying and by refusing to deal with Huawei by way of seeking an injunction before the United States International Trade Commission and the United States court.²⁷¹⁶

In the first case alleging violation of FRAND principles, Huawei petitioned to the court for a statutory determination of a FRAND royalty rate applicable to the licensing of SEPs to it by InterDigital. The court found that InterDigital voluntarily participated in forming the relevant ISO standards and committed to license its SEPs on FRAND terms. The court considered that, in doing so, InterDigital should have foreseen that its SEPs would have also been incorporated into Chinese standards due to consistency requirements. As such, the court considered that whilst InterDigital did not directly participate in the formation of the Chinese standards, it was nevertheless obliged to grant a licence to Huawei on a FRAND basis. The court further set a FRAND rate capped at 0.019% of the actual product selling price. InterDigital appealed, and the Guangdong High Court upheld the Court of First Instance's ruling.

In the second case alleging an abuse of dominance, Huawei claimed that InterDigital had abused its dominant position in the licensing of SEPs for 3G wireless communications, and on that basis, Huawei requested RMB 20 million (approximately USD 3 million) in damages. The Court of First Instance held that InterDigital had violated its FRAND commitments and abused its dominant position by charging excessive royalties, refusing to deal with Huawei, tying and discriminatory treatment. It further ordered InterDigital to cease the misconduct and awarded the damages Huawei claimed. However, the court rejected InterDigital's claim that the package combining Chinese SEPs with non-Chinese SEPs licensed to Huawei by InterDigital constituted an abuse of a dominant position.

Both parties appealed, and the Guangdong High People's Court ruled in October 2013, affirming all of the Shenzhen court's rulings. Interestingly, InterDigital had argued that whilst it held a large number of SEPs under the WCDMA, CDMA200, TD-SCDMA standards for 3G communications technologies (which were at issue in the case), the relevant product market should also include the 2G and 4G standards as both are substitutable with the 3G standard. However, the Guangdong High Court rejected this argument, affirming the finding of the Court of First Instance. Specifically, the appellate court considered that a licensee could arguably switch with relative ease from one technology to another at the time the standard was set, but such switching would become increasingly difficult as time passes because of the increasing resources the licensee would have put into the standard it had chosen. Huawei was considered to have already made a significant early-stage contribution in order to implement the 3G standard and such investment could not be withdrawn, whilst switching to another standard from the 3G

2715 Yue Gao Fa Min San Zhong Zi, No. 305 (2013).

2716 Yue Gao Fa Min San Zhong Zi, No. 306 (2013).

standard would not only result in the loss of early-stage investment but would also result in significant switching costs and market risks.

10.7.4.2.4.2. Qualcomm case

The SEP royalty issue is well-knowingly touched, although through an indirect way, by the Chinese antitrust authority (then NDRC)'s decision against Qualcomm.²⁷¹⁷ On 9 February 2015, the NDRC issued a decision against United States semiconductor giant, Qualcomm, imposing a record penalty of RMB 6.088 billion (approximately USD 975 million), which equated to approximately 8% of Qualcomm's 2013 China revenue, and imposed a set of remedies around the company's patent licensing practices. The *Qualcomm* case marked a new record for the highest individual fine in China and it by far exceeded the previous largest fine imposed by the NDRC under the AML in a single case²⁷¹⁸ and against a single company.²⁷¹⁹

Qualcomm was found to have abused its market dominance in SEP licensing markets by, amongst others, engaging in excessive pricing. By asserting an excessive price is levied to the implementers, the conceptually challenging question of pricing royalty, or at least defining pricing parameters, was facing the Chinese authority.

In the Qualcomm decision, the NDRC however did not set a specific royalty rate for Qualcomm's SEP licensing. Rather, the authority established its theory of unfairly high royalties by weighing the following three factors: (1) Qualcomm refused to disclose its patent list despite the fact that there were expired patents included in its portfolio licensed to the implementers; (2) Qualcomm forced implementers to grant cross-license on a free-of-charge basis; and refused to deduct the royalties regardless of the value of the patents reversely licensed; and (3) Qualcomm charged relatively high royalty fees by unreasonably use the net sale price of the whole devices which incorporated technologies irrelevant Qualcomm patents.

NDRC's decision as such dodged the intrinsically difficult problem of determining the royalty level, it rather asserted that an excessive pricing may not necessarily only stem from the royalty amount itself, but a combination of different factors. The authority's decision also did not contain an explicit remedy on pricing but accepted Qualcomm's offer as a half-way compromise to use 65% of the net sale price of the devices as the base of calculating royalties.

Similarly, in the *Huawei v. InterDigital* case, the Guangdong High Court found that Inter-Digital charged Huawei excessive royalties on the grounds that the royalties were clearly

2717 http://www.ndrc.gov.cn/gzdt/201503/t20150302_666209.html

2718 Prior to the Qualcomm case, the largest fine imposed by the NDRC in a single case was RMB 832 million (approximately USD 136 million) imposed in the auto parts cartel. See NDRC, '日本十二家企业实施汽车零部件和轴承价格垄断被国家发展改革委罚款12.35亿元' (Press release, 20 August 2014) press release, <http://www.sdpc.gov.cn/fzgggz/jgjdyfld/jjszhdt/201408/t20140820_622757.html> accessed 17 January 2018.

2719 Prior to the Qualcomm case, the largest fine imposed by the NDRC against a single entity was RMB 290 million (approximately USD 47 million) imposed against Sumitomo Electric. See the Administrative Penalty Decision of the National Development and Reform Commission of the People's Republic of China, Fa Gai Ban Jia Jian Chu Fa (2014) No. 9.

higher than were charged to other multinational device manufacturers.

10.7.4.2.4.3. The IP Guidelines

The factors considered by the NDRC and the Guangdong High Court have largely been codified into the 2017 Draft IP Guidelines. In the draft, it is explained that whether or not royalties are considered to be excessive should be determined by taking account of: (1) the method of calculating the royalties and the contribution of the IP to the value of the relevant product; (2) the licensing commitments attached to the IP; (3) the royalties charged historically and comparable royalties; (4) whether the IP holder charges royalties beyond the IP's geographical or product scope; (5) in the case of licensing package, whether the IP holder charges royalties for expired or invalid IP; and (6) whether the IP holder forces, by injunctive relief, the licensee to accept the royalties it proposes.²⁷²⁰

10.8. Upper layer standards – standards for data

In order to function properly, IoT devices will gather large amounts of data from their users. Such data will be both personal, relating to identifiable individuals, and non-personal, where the information about individual person cannot be discerned.²⁷²¹ However, for the seamless functioning of IoT system such data will need to be shared among different manufacturers of IoT equipment. Precisely how the sharing and interoperability of IoT data is to be achieved remains an open question.

10.8.1. Access to data issues

When discussing access to data, a distinction should be made between personal and non-personal data. They are governed by different legal regimes with different conditions for their sharing and re-use.

The legal regime for the use of personal data is regulated in the EU by the General Data Protection Regulation (GDPR) which applies to any sharing of personal data. The GDPR provides six legal bases for lawful processing of personal data, most relevant in this case being the consent of the data subject.²⁷²² A consent of the data subject must be freely given and relate for specific purposes.²⁷²³ A data protection regime therefore means that companies are not free to share personal data of their users. They must respect

²⁷²⁰ Anti-Monopoly Commission, 'Anti-monopoly guidelines on abuse of intellectual property rights' (Draft, 2017), art. 14.

²⁷²¹ Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC, L 119/1 (GDPR) Article 4, point 1 ('personal data' means any information relating to an identified or identifiable natural person ('data subject'); an identifiable natural person is one who can be identified, directly or indirectly, in particular by reference to an identifier such as a name, an identification number, location data, an online identifier or to one or more factors specific to the physical, physiological, genetic, mental, economic, cultural or social identity of that natural person.

²⁷²² Ibid, Article 6.

²⁷²³ Ibid, Article 7.

the conditions of the GDPR and must obtain prior informed consent of their users for sharing personal data with other IoT manufacturers.

On the other hand, users have the right to data portability by Article 20 of the GDPR, under which they are allowed to receive their own personal data held by a data controller and to transfer such data to another controller.²⁷²⁴ The aim of this provision is to facilitate switching between data-driven services and provides data subjects some degree of protection against data-induced lock in.²⁷²⁵ It allows data subject, for example, to switch their data from one platform to another. However, this provision is not designed to provide full interoperability and continuous data sharing between devices. It applies only once data subject request portability and only for a particular transfer. It is thus not possible to use Article 20 as a basis for achieving full data interoperability between different IoT devices.

In the US, there is no single principle data protection regulation. While, on the federal level, there are several sector specific regulations, several states provide data protection for individual consumers. Generally, as a point of departure – both in reference to federal statutes and state laws – individuals have a right to data protection. However, such protection can be limited or eliminated by statute, contracts or through disclosure.

An example of sector specific regulation that stipulates a right to port data is the Federal Health Insurance Portability and Accountability Act of 1996 (HIPAA). It stipulates a right to access and port data between health providers and requires that standards for the electronic exchange are published and available.

Besides personal data, IoT devices may collect non-personal data which relates to environment or to users' activity without precise identification of an individual. For example, devices may generate data on road traffic conditions and soil activities or collect aggregated anonymised data on their users' activities. It is currently open whether non-personal data is protected by intellectual property rights.²⁷²⁶ Non-personal data may be protected by trade secret right,²⁷²⁷ if it's not publicly available and holds a commercial value, or a *sui generis* database right protection.²⁷²⁸ In any event, non-personal data can also be protected by contractual rights of data controllers. Access to such data can be granted on a contractual basis.

In that regard, the EU Commission is considering the possibility of sharing the access to non-personal data between businesses. In 2017 the EU Commission published a Com-

2727 Directive (EU) 2016/943 of the European Parliament and of the Council of 8 June 2016 on the protection of undisclosed know-how and business information (trade secrets) against their unlawful acquisition, use and disclosure, OJ L 157.

2728 Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, OJ L 77.

munication entitled “Building a European Data Economy”. In relation to access to data, the Commission explored the idea where access to machine generated data would be granted against remuneration.²⁷²⁹ The Communication noted that: “A framework potentially based on certain key principles, such as fair, reasonable and non – discriminatory (FRAND) terms, could be developed for data holders, such as manufacturers, service providers or other parties, to provide access to the data they hold against remuneration after anonymisation. Relevant legitimate interests, as well as the need to protect trade secrets, would need to be taken into account. The consideration of different access regimes for different sectors and/or business models could also be envisaged in order to take into account the specificities of each industry. For instance, in some cases, open access to data (full or partial) could be the preferred choice both for firms and for society.”²⁷³⁰

Following a public consultation, the Commission in 2018 published a Guidance on Sharing Private Sector Data in the European Data Economy.²⁷³¹ It recommended companies to consider voluntarily granting access to non-personal data to other businesses and, when doing so, to adhere to certain principles related to transparency, respect to each other’s commercial interests, to ensure undistorted competition, and minimise lock-in.²⁷³²

Therefore, access to personal and non-personal data generated by IoT objects is subject to principles of data protection regulations, as well as contractual will of data controllers. The next section will analyse whether competition law or sector specific regulation could provide mandatory access to data.

10.8.1.1. The role of competition law in providing access to data

There is currently an ongoing debate about the applicability of competition law for providing access to data sets.²⁷³³ However, it would seem that competition law is not an adequate instrument to ensure widespread interoperability and data sharing between IoT devices for a number of reasons. This is because competition law only applies to dominant undertakings and sharing of data in IoT context would be needed between large number of companies that are not in a dominant position. For example, a self-driving car would be information on traffic conditions from road infrastructure as well as from other (self)driving vehicles, the manufacturers of which may not be in a domi-

Bakhoun et al. (eds.), *Personal Data in Competition, Consumer Protection and Intellectual Property Law* (Springer 2018); Autorite de la Concurrence and Bundeskartellamt, *Competition Law and Data* (2016); OECD, ‘Big Data: Bringing Competition Policy to the Digital Era’ (2016); Inge Graef, *EU Competition Law, Data Protection and Online Platforms: Data as Essential Facility* (Kluwer Law International 2016).

nant position. Therefore, competition law could hardly impose a general access remedy needed in the IoT context. Furthermore, a data would need to be indispensable in order to compete on a downstream market, which may not always be the case.²⁷³⁴ Finally, competition enforcement is generally slow, unpredictable and conducted on a case-by-case basis, while intervention in the IoT would be needed to be rapid and standardised in order to ensure an equal level playing field between companies. There is also a problem of enforcement of competition law-imposed access remedy, with competition authorities turning into price regulators.²⁷³⁵

Nevertheless, while maybe not adequate as a general solution in the IoT context, competition law has been applied in several instances by national competition authorities to ensure access to data held by dominant companies. For example, French competition authority investigated Cegedim, a leading provider of medical information databases in France, which refused to sell its main OneKey database to customers using the software of its competitor.²⁷³⁶ The French Competition Authority considered such behaviour as discriminatory and concluded that, given that OneKey was the leading dataset on the market for medical information databases and that Cegedim was a dominant player, such a discriminatory practice had the effect of limiting Euris's development and was anti-competitive. Also in GDF Suez case, French competition authority adopted interim measure requiring Suez, a leading gas supplier, to grant its competitors access to some data it collected as a provider of regulated offers, in particular consumption data.²⁷³⁷ The aim of this interim measure was to allow all suppliers to have the same level of relevant information to make offers to consumers as no public information or private database exists on households subscribing to gas contracts.

U.S. Antitrust Law generally does not impose a unilateral duty on firms to share assets, including data, with competitors. The Supreme Court has never recognized the so-called essential facilities doctrine, and U.S. courts have consistently expressed scepticism of the notion that firms have an overarching duty to deal with competitors. The somewhat dated *US Aspen Skiing* case²⁷³⁸ is one of very few antitrust cases where the Court

2734 See Commission, 'Guidance on the Commission's enforcement priorities in applying Article 82 of the EC Treaty to abusive exclusionary conduct by dominant undertakings' 2009/C 45/02, para 81; Case T-201/04 Microsoft v Commission, ECLI:EU:T:2007:289, para 332.

2735 The difficulty in crafting and monitoring the compliance with interoperability remedy can be seen in Microsoft saga by the European Commission. There, the European Commission found that Microsoft abused its dominant position by refusing to provide interoperability information of its Windows Server operating system and ordered Microsoft to provide interoperability information to third parties under reasonable and non-discriminatory conditions. The European Commission later found that Microsoft was charging non-FRAND prices for access to interoperability information and imposed additional fine of EUR 899 for non-compliance. See: T-167/08 Microsoft v Commission; Commission, 'Antitrust: Commission imposes € 899 million penalty on Microsoft for non-compliance with March 2004 Decision' (Press Release) (2008) IP/08/318.

2738 US Supreme Court, *Aspen Skiing Co. v. Aspen Highlands Skiing Corp.*, 472 U.S. 585 (1985). Wolfgang Kerber and Heike Schweitzer, 'Interoperability in the Digital Economy' (2017) 8 JIPITEC 39; See also Marina Lao, 'Aspen Skiing and Trinko: Antitrust Intent and "Sacrifice"' (2005), 73 Antitrust Law Journal, 171 et seq.

imposed an obligation to collaborate, while the more recent Supreme Court case *Trinko* seems to severally limit – or even do away – with a duty to collaborate with competitors under US Antitrust Law.²⁷³⁹

The US antitrust agencies have had occasions to consider the competitive significance of data in the context of merger reviews. For example, the Thomson and Reuters, were two of the three largest providers of financial data to institutions like investment banks and trading firms, proposed to merge in 2008. The Antitrust Division concluded that the transaction would have led to higher prices and reduced innovation, and so it required Thomson to divest copies of three financial datasets in order to proceed with the acquisition.²⁷⁴⁰ However, apart from the merger scenarios, US Antitrust Law seems non-applicable for accessing competitors data.

As to BRICS countries, in Russia the issue of mandatory data access under competition law was raised in a course of the public debate of the Fifth Antimonopoly Package intended to adapt competition law to digital economy.²⁷⁴¹ The first version of the bill, drawn up by the Federal Antimonopoly Agency (FAS of Russia) in cooperation with HSE-Skolkovo Institute for Law and Development, included several provisions about big data. According to the bill, the relevant data collection and use are additional factors that shall be taken into account in the competition analysis related to the digital multi-sided markets. It also introduced a new subject matter for authority's binding orders (so-called "prescriptions"): the authority has the right to issue an order "on the compliance with economic, technical, information and other requirements to eliminate discriminatory conditions for access to data, including consumer data, as well as to prevent the creation of such discriminatory conditions".²⁷⁴²

Over the last few years Russia has made a good progress in modernizing the existing legislation in line with the international best practices related to digital economy. At the same time the process of regulatory reform in Russia has its own characteristics. With the development of big data analytics, the legal aspects of data management, data ownership and data sharing have become a hot topic for Russian companies. However, the current dialogue between the business and the state is focused mostly on reduction of regulatory burden for innovative companies. In this context, the new rules concerning mandatory data access didn't find support from the business community. FAS of Russia

2741 Draft Federal Law "On Amendments to the Federal Law on Protection of Competition and Amendments to the Code on Administrative Offences" (the 5th Antimonopoly Package). The modified version of the draft law version of the draft law dated October 17, 2018, was published on the Federal Antimonopoly agency official site: <<http://en.fas.gov.ru/documents/documentdetails.html?id=15345>>.

2742 Official text of Fifth antimonopoly package, including the first version, is available at: <<https://regulation.gov.ru/projects#npa=79428>>.

has decided to revisit the issue of data dominance and data access at a later stage when the newly drafted regulation in the field of data management would be put in place.

At the same time, the Federal Law on Protection of Competition does not prevent the competition authority from taking into account the adverse effects of data monopolization on competition. FAS of Russia may treat anticompetitive data use in the same way as it treated the limitations of access to the relevant information in the case *Kaspersky v. Microsoft*, resolved in 2017.²⁷⁴³ Kaspersky filed a complaint against Microsoft, arguing that Microsoft gave the company, as well as other independent antivirus software developers, only seven days before the release of Windows 10 to make their software compatible with the new operating system. As a result, the developers didn't succeed to adjust their antivirus products timely to meet customers' expectations. The agency found that Microsoft had abused its dominant position. According to the decision, the negative consequences for competition were caused not by the individual actions of Microsoft Corporation to shorten the time for providing RTM versions of Windows 10, but by a combination of actions that led to restriction of competition in the antivirus software market in the territory of the Russian Federation. Microsoft complied with the warning issued by FAS and made the appropriate changes to its Antimalware Platform Requirements to open timely access to data, related to new operating system (OS) releases, for independent developers.²⁷⁴⁴ Similarly, in future cases concerning anticompetitive data policy of digital platforms the Russian competition authority will analyze how the collection and use of data by the dominant entity effects the related downstream markets.

Besides the abuse of dominant position, FAS intends to pay special attention to data access issues in merger control. In 2018 FAS approved *Bayer/Monsanto* deal under the certain conditions, which consisted essentially of behavioral remedies aimed at promoting potential competition on the part of Russian companies.²⁷⁴⁵ The imposed conditions included, *inter alia*, obligations to provide Russian companies engaged in the development of agricultural software and applications with non-discriminatory access to digital farming platforms, including access to historical data related to the Russian Federation, as well as to the data that will be collected by Bayer AG after commercialization of its program products on the territory of Russia.²⁷⁴⁶ *Bayer/Monsanto* deal is the first case of its kind, and is likely to serve as a model for future merger investigations.

2746 The FAS of Russia approved the Bayer/Monsanto Deal. 23.04.2018. <<https://en.fas.gov.ru/press-center/news/detail.html?id=52952>>. For more information see also: OECD. Annual Report on Competition Policy Developments in the Russian Federation. DAF/COMP/AR(2019)51. (OECD,2019). P.23-25.

Another barrier to address data access issue by competition law is IPR immunities.²⁷⁴⁷ There is a trend to protect big data by database producer neighboring rights,²⁷⁴⁸ which makes the competition law intervention next to impossible. The general clarification of the intersection between competition law and intellectual property law and the specific issue of abandoning IPR immunities are still under discussion.

In China, the competition authority has not yet addressed data issue as an independent form of theory of harm. However, it did emphasize the importance to data, or technology as such in its merger clearances by imposing behavioural remedies upon merging enterprises. These remedies, having its general background of guarantee a continued and non-discriminatory supply to Chinese downstream operators. For example, in *Bayer/Monsanto*, the authority requires the merged entity to provide access of its agriculture development app to Chinese downstream operators under a FRAND term in five years post-closing. In *Rockwell Collins/UTC*, the Chinese authority requires the company to maintain the interoperability and mutual-accessibility in terms of data transmission of its A664 terminal system. There is an ongoing debate among academia and practitioners that further importance should be adhere to date when reviewing merger cases in TMT and ICT sectors. Such proposal, however, is still in its infancy for lack of practicality to effectively measure the quality/importance of data (instead of the mere quantity). Besides, putting data into remedy consideration is again intertwined with the application of essential facility doctrine and the universal dealing obligation, which both need case-by-case analysis instead of a one size apply to all principle. Rather, the current approach adopted by the Chinese authority is of more agility (although lack for predictability) for addressing case-specific data issue by behavioural commitments.

No developments are observed in other BRICS countries.

10.8.1.2. Sectoral measures

With competition law providing an unsatisfactory answer to data sharing in the IoT, there have call for specific legislation to regulate standardised access to data.²⁷⁴⁹ While there is currently no overarching legislation to date, there are some sectoral regulations that provide access to data in certain sectors.

For instance, the revised Directive on Payment Services in the Internal Market of 25 November 2015 sets out that account servicing payment providers, such as banks, must allow third parties to obtain real-time data relating to customers' accounts on a non-dis-

2747 See part 4 of article 10 and part 9 of article 11 of the Federal Law on Protection of Competition Law. English translation of the law is available at the Federal Antimonopoly agency official site: <http://en.fas.gov.ru/documents/documentdetails.html?id=14737>

2748 The new database producer rights were introduced in the part 4th of the Civil Code of Russian Federation in 2008, thus creating the analog of the European sui generis database right covered by related rights protection.

2749 There seems to be a wide support in the literature for some sort of sector specific legislation. See Jacques Cremer, Yves-Alexandre de Montjoye, Heike Schweitzer, 'Competition Policy for the Digital Era' (2019) p. 10; Digital Competition Expert Panel, 'Unlocking Digital Competition' (March 2019); Mathew Heim, Igor Nikolic, 'A FRAND Regime for Dominant Digital Platforms' (2019) 10 JIPITEC 1; Josef Drexler, 'Designing Competitive Markets for Industrial Data – Between Propertisation and Access, 8 (2017) JIPITEC 257.

criminary basis (including without any discrimination in terms of charges, timing and priority).²⁷⁵⁰ Furthermore, the Recital 16 of the eCalls Regulations provides 112-based eCall in-vehicle system should be accessible for a “reasonable fee not exceeding a nominal amount and without discrimination to all independent operators for repair and maintenance purposes” and calls for further legislation in this field.²⁷⁵¹

Interestingly, the new European Electronics Communications Code (EECC) includes an obligation to provide interoperability between “interpersonal communication services”, which reach a significant level of coverage and user uptake.²⁷⁵² This provision may arguably be used by national regulatory authorities to impose an obligation on widely used communication applications or social platforms to interoperate.²⁷⁵³ However, such regulatory interventions may be possible only where end-to-end connectivity is endangered and only to the extent necessary to ensure connectivity between end-users.²⁷⁵⁴ Nevertheless, this provision represents an evolution in providing a regulatory solution to ensuring interoperability between particular types of platforms that have a significant reach, though it may not be dominant in the competition law sense. These sectoral measures may represent a first step towards a more comprehensive regulation of data sharing in the future.

Regarding BRICS countries, in China, the discussion has not touched the data sharing mechanism as such, in terms of data obtained or generated by private companies. However, the government is now promoting the sharing or accessibility of government obtained data in (public-funded) fundamental scientific research and public services. It is also notable that the Chinese government targets to establish a “big data” platform for healthcare sector so as to enhance the national healthcare services. Meanwhile, it is also worth-noting that the Chinese Internet Security Law imposes universal dealing obligations and special security protection obligations over platforms and systems deemed as “key fundamental facilities”. It is widely understood that key fundamental facilities’ obligation includes, inter alia, the obligation of providing access to essential data access to the public or the downstream business. However, this clause has not to date applied. In that sense, the detailed implication on data sharing by such a mechanism still remains unanswered.

However, no sectoral measures regulating access to data are currently available in other BRICS countries.

10.8.2. Data pools

Data pools are initiatives by companies to share their data on a given market or industry.²⁷⁵⁵ Companies are increasingly recognising the benefits of open sharing of information and are joining private initiatives for sharing data between themselves. For example, Google, Facebook, Microsoft and Twitter in 2017 formed the Data Transfer Project with the aim of building a common framework with open-source code that can connect any two online service providers, enabling a seamless, direct, user initiated portability of data between the two platforms.²⁷⁵⁶

Data pools are yet unexplored area of competition law. On the one hand, they can provide significant efficiencies to their members by allow firms to produce better products or services than they could develop based on their own data alone. Data pools may also help firms to offer complementary, value- added services and foster entry into neighbouring markets.²⁷⁵⁷ For example, access to in-car data or to smart home data may allow firms to develop complementary applications.

On the other hand, data pooling can also lead to anti-competitive effects. Data pools may lead to collusion if they enable exchanges of commercially sensitive information such as costs or prices. Depending on the size and strength of data pool, it may discourage companies from differentiating and improving their own data collecting, leading to loss of quality and innovation. Finally, when a pool has market power it may be under a duty to give third parties access to data as well.²⁷⁵⁸

There are yet no clear guidelines how to assess data pools from a competition law perspective. The ECJ in *Asnef-Equifax* case analysed a register of information between Spanish financial institutions on the solvency of customers.²⁷⁵⁹ It held that such credit-worthiness registries are not restrictions by object,²⁷⁶⁰ and whether they constitute a restriction by effect will depend on “the economic and legal context in which the registers exist, and in particular on the economic conditions of the market as well as the particular characteristics of the register”.²⁷⁶¹ On the facts of the case, it held that data sharing arrangement also had no anti-competitive effects if the relevant market is not highly concentrated, the system does not provide lenders to be identified and the conditions of access and use by financial institutions are not discriminatory.

Therefore, the assessment of potential anti-competitive effects of patent pools would have to be carried out on a case-by-case basis. However, generally pools that share strategic and competitive information, such as price- lists, future output prediction and new innovations, should be considered at risk of being restrictions by object according

2761 Ibid, para 57.

to Article 101(1) TFEU. On the other, data pools containing technical information for the development of new products and services or facilitating interoperability between devices could be regarded as presumptively legal. However, the problem in practice would be identifying, precisely, which information falls in what category.

Commission guidelines on the assessment of technology (patent) pools may also provide a source of inspiration.²⁷⁶² The Commission considers that patent pools can produce both positive and negative effects and created a safe harbour under which the operation of patent pools falls outside of Article 101(1) TFEU altogether.²⁷⁶³ Conditions to be satisfied include participation is open to all interested technology owners, sufficient safeguards are adopted to ensure that only essential technologies are pooled and that exchange of sensitive information is restricted; the pooled technologies are licensed on a non-exclusive basis and under FRAND terms; and the parties to a pools and licensees are free to develop competing products and technologies.²⁷⁶⁴ By way of analogy, Lundquist develops a similar model under which data pools could be assessed to fall outside Article 101(1) TFEU.²⁷⁶⁵ He recommends, for instance, that only datasets essential for that objective of the pools should be included; pool members should be allowed to grant individual access to their individual datasets; the pool must be open to any interested third parties; grant-back data clauses must be limited to essential data; access to data must be granted under FRAND terms; safeguards should be provided to protect exchanges of sensitive commercial information etc.²⁷⁶⁶

Also in the US, a budding discussion regarding data pools exists, where the risk of collusion has been identified as a main obstacle for data pools to form.²⁷⁶⁷ Paul Uhler and J.H. Reichman have noted that "[t]he evidence shows that such [database] pools are very difficult to form when the value of upstream research products defies easy measurement and the relevant players in a given industry have very different agendas, as would occur when federal agencies, academic institutions, and different types of private companies are all involved. Moreover, there are far greater risks that such pools lead to collusive, anti-competitive behaviour, to the erection of formidable barriers to entry."²⁷⁶⁸

Members of US academia suggest that a proposal designed to encourage the pooling of data could succeed in being passed into law, and point to the National Cooperative Research and Production Act (NCRPA).²⁷⁶⁹ A federal law passed in 1984 that reduces antitrust liability for certain research consortia that make their activities known to the

Department of Justice.²⁷⁷⁰ Would data pools fall inside the NCRPA, or should a similar law be passed that would *de facto* exempt data pools from Antitrust scrutiny, pooling data between competitors would be greatly encouraged and promoted.

Indeed, data pools should be scrutinized under Competition Law in analogy with R&D collaborations, rather than being compared to patent pools. Data pools imply primarily an exchange of data so to develop new forms of services and products and are not mechanisms for collecting FRAND royalty.²⁷⁷¹

Therefore, data pools represent a novel phenomenon with no clear guidance by competition authorities. General doctrines on information exchanges and existing guidelines on R&D collaborations may serve as a framework for competitive assessment of data pools, while the general structure of patent pools can be used as inspiration for setting up open data pools or even data commons.

As to situation in BRICS countries, no practice has yet been observed.

10.9. Other means for creating more competition?

One of the main problems raised by the digital revolution is the lack of a proper institutional setting organising the process of marketization and monetization of data with the development of properly functioning markets. Hence, as we have also highlighted in other parts of the report we have a missing markets problem²⁷⁷². As for what we put forward regarding personal data in other parts of this report, the development of some regime of exclusive rights or a proper property rights regime on non-personal data may offer the possible way forward.

10.9.1. Property solution

One model that was considered by the European Commission was the introduction of data producers property rights,²⁷⁷³ as a solution to avoid data lock-in and facilitate data sharing in the IoT environment. The idea was that the right to use and authorise the use of non-personal data could be granted to the data producer i.e. the owner or long-term user of a device.²⁷⁷⁴ This would hopefully clarify the legal situation on data-ownership and give more choice to the data producer by giving the possibility to users to utilise their data and contribute to the IoT environmental.

However, the creation of data producer's property right has been criticised in the literature and appears not to have been endorsed by the European Commission in the

2774 Ibid.

end.²⁷⁷⁵ Kerber, for example, questions the rationale for introduction of a new IP right.²⁷⁷⁶ The main justification for IP rights is the need to secure incentives for innovators and creators, but in data-context the empirical evidence shows that companies are amassing large amounts of data and there appears to be no need for additional incentives for companies to produce and analyse data.²⁷⁷⁷ It is further pointed out that already contract law and trade secrets law provide adequate security to data-holders against unwarranted use of data.

One of the main concerns is that data-driven markets in fact need more access and not a creation of more exclusivity rights. A data producer's right would create property for the data owners with the ability to exclude others from its unauthorised use. It is questionable whether in reality data producer's right would make data-ownership more transparent and lead to reduction of transaction costs. Drexl notes that more powerful manufacturers can *ex-ante* include a clause in its contracts according to which ownership in the data will be transferred for free to the manufacturer.²⁷⁷⁸ The unequal distribution of bargaining power will not be remedied by the creation of a new IP right. Moreover, it may even increase transaction costs as now more licenses would need to be obtained in an environment with a large number of data producer's. It is unclear how this task would be undertaken, which may lead to 'data-holdup' or 'data-trolls' where data producers' refuse to license their data and later opportunistically seek to enforce and monetise them.²⁷⁷⁹

Further issues lie in the interaction between personal data protected by the GDPR and the data producer's right for non-personal data. Data producer's rights would apply only to non-personal data, defined as data which originally did not relate to an identified or identifiable natural person or data which were initially personal data, but were later made anonymous.²⁷⁸⁰ It is however difficult to make the data completely anonymous and with the advancement of new technologies and encryptions it is often possible to de-anonymise data. If data could be de-anonymised, then it cannot be considered as non-personal data and data producer's rights would not apply. Moreover, the majority of data sets consist of both personal and non-personal data (mixed datasets), for example data related to IoT devices where some of the data allow assumptions to be made about identifiable individuals (such as the presence at a particular address and

2775 For arguments cautioning against the creation of data producer's rights and potential problems in implementation see: Wolfgang Kerber, 'A New (Intellectual) Property Right for Non-Personal Data? An Economic Analysis' (2016) available at: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2858171; Josef Drexl, 'Data Access and Control in the Era of Connected Devices' (2018) Study on Behalf of the European Consumer Organisation BEUC.

usage patterns).²⁷⁸¹ If the non-personal data part and the personal data parts are ‘inextricably linked’, the data protection rights and obligations from the GDPR fully apply to the whole mixed dataset, even if personal data represent only a small part of the dataset.²⁷⁸² Therefore, in reality it might not be easy to identify non-personal data which is not mixed with personal data or data that cannot be de-anonymised, which limits the use of data producer’s rights.

Consequently, an alternative solution to fair access to data might be sector-specific data access rights, which will be explored in next section below.

10.9.2. Access solution

There seem to be a general need for rules regarding fair access to data. Several sector specific regulations do grant firms and competitors access to data, while as indicated above, Competition law may set high thresholds for accessing data held by a system leaders or competitors. Below some few sector specific legal systems are presented where right to access to data are included. We have explored above the different approaches followed as to the development of data commons, for instance through the free access to government data (e.g. PSI Directive) and sector-specific access rules (such as the eCall regulation) for access to non-personal data. Data portability schemes are also particularly interesting for the development of the IoT.

If the IoT causes structural changes to the industry, such as, and with the benefit from, indirect network effects and tipping, such changes should perhaps be balanced by structural rules. That could imply creating new forms of rights regarding data.

The data, the information (as such), are not currently covered by property rights, regardless of how private and valuable it is.²⁷⁸³ No one owns personal data, although the ‘data subject’ in the certain jurisdictions such as the EU retains some rights in regards to the data, under the EU General Data Protection Regulation.²⁷⁸⁴ This notwithstanding, if an individual piece of data (personal or non-personal) fulfils the requirement for intellectual property rights, it can be covered by copyright, for instance (3rd party copyright, or copyright held by firm that is also a gatekeeper for data access on the server).²⁷⁸⁵ Moreover,

2781 Ibid, p. 8.

2782 Ibid, p. 9.

2783 There are authors who propose the recognition of ownership rights for consumers to the data they produce, e.g., Hoofnagle and Whittington, ‘Free: Accounting for the Costs of the Internet’s Most Popular Price’ (2014) 61 UCLA Law Review, 606-670. Moreover, there is a discussion regarding how to conceptualize privacy, sphere theory, data category theory, ownership theory, empirical theory, and what seems to be relevant ‘decisional autonomy.’ see. Greenstein, *Our Humanity Exposed*, Stockholm, Stockholm University (Doctoral thesis, 2017), 187 et seq.

2784 There are some rights connected to personal data in Articles 18-20 of the General Data Protection Regulation, such as the right to have data corrected, the “right to be forgotten” and the right to data portability. In reference to data portability, the right is limited, making it less attractive for consumers to switch social websites. Cf. Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) (Text with EEA relevance) OJ L 119, 4.5.2016, p. 1-88.

2785 Moreover, the firms providing the e-ecosystem or infrastructure of the IoT will have the infrastructure covered by pat-

economic rights (ownership) to data can co-exist with personal data protection. Even though the data are personal in the sense that individuals hold rights to them under, for example a Data Protection Regulation, economic rights to the data can be held by other entities.²⁷⁸⁶

Under personal data rules, there may be a mandatory right to port data. And while the personal (or consumer) mandatory porting right is not economical, it may still serve as a source of competition.²⁷⁸⁷ In fact, it works as a consumer protection rule. Individuals have the right to port data and that right cannot be contractually eroded or derogated. However, it is regarding non-personal data, especially in reference to Industrial Internet when the discussion about property rules and a porting right have flourished. Nonetheless, generally, in academia the idea of new forms of intellectual property are shunned.

Today, a growing body of literature suggests that we would be far better off with less property rights, and less patent and copyright protection, in both duration and scope.²⁷⁸⁸ Perhaps the intellectual property system we have is worse than not having any protection at all. There is almost a general consensus on the notion that intellectual property rights need to be restricted and limited. According to Hovenkamp, this poor fit would call into question any presumption that competition policy should yield to intellectual property policy: "We know pretty well what competition is and that it should be protected. However, we hardly know what intellectual property is and if it should be protected."²⁷⁸⁹ Moreover, in the realms of data, the idea of including property rights in the IoT mix has been strongly rejected.²⁷⁹⁰

In several ways, the debate referred to above is obsolete. The gatekeepers in IoT, the e-platform economy, do not honour several of the intellectual property rights we have jointly agreed to be to all-encompassing. It seems that the system leaders in these silos or e-ecosystem will, through network effects, tipping, and contracts, and, indeed, the

ents and copyright and can also, technically, prevent access to the data. Traditionally, copyright owners resort to technical protection measures (TPMs), cf. Art 6 InfoSoc, to prevent access to the copyright-protected content. Interestingly, InfoSoc finds that not only breaching these technical protection constitutes a copyright infringement, but also that the manufacturing and sale of devices which have the primary purpose or effect of enabling such circumvention may be a copyright infringement in itself. In reference to datasets including copyright-protected data, Art. 6 InfoSoc would still be applicable. See the interesting conference paper by Ciani, 'A competition law oriented look at the application of data protection and IP law to the Internet of Things: towards a wider holistic approach,' MPI Post Doc Conference, Munich (21 October 2016).

use of economic power, be able to collect, store and re-use data without being required to honour or use intellectual property rights. They control the technical flow of data, which gives them the power to enter markets or industries through the use of contracts that diminish the threat of infringements of intellectual property rights through non-assertion clauses.

In several aspects, the new copyright regulation in the EU is a reaction to the above. Article 13 indirectly stipulates that platforms cannot escape paying copyright fees when using copyright protected material (data), when they provide their services.²⁷⁹¹

Generally, the e-ecosystem agreements seem to include restrictions for the users of platforms or clouds, such as exclusivity, non-tampering, and a ban on reverse engineering. Some platform and cloud service providers included broad non-assert provisions that prevent customers from asserting their intellectual property rights against the system leader, or any other cloud service customer or partner.²⁷⁹²

We may presume that producers of, e.g., cars and refrigerators, have their own patent landscapes that the system leaders could simply eliminate. Years or decades of investment in R&D could be lost because the device producers in future need to provide interoperability to their customers, and hence need to connect to the e-ecosystems and thus possibly surrender their property rights to the gatekeepers. Indeed, non-assertion clauses can if they are wide eliminate the incentive to conduct R&D, if the firm knows that it can still not prevent a firm to enter the market. Cloud providers may with the use of these clauses and the data advantage become very potent competitors to any Cloud user.

In the flow of data, the device producers and/or the system leaders will hold some intellectual property rights, such as *sui generis* database protection. They can perhaps claim that the datasets they collect are trade secrets.²⁷⁹³ However, the system leaders' businesses do not seem to revolve around the need for or use of property. On the contrary, the data collection agreements, that the system leaders provide to the business users control the whole relationship or ecosystem, to the benefit of the system leaders. They control the data flows.

In this light, it seems that some rights to the benefit of brick-and-mortar firms may create competition. Property, or some aspects included in the bundle of rights that we call property, may empower the device producers vis-à-vis the platform and cloud service providers, and, thus, enhance competition by lessening the network effects and increasing the commercialisation of data sales. However, not a full property right, the right that creates competition is instead the right to transfer 'their' generated data from a platform to another. It may well be that a porting right in datasets is the solution. Porting may create competition between the e-ecosystems, as it enables users, brick-and-mor-

2791 <https://ec.europa.eu/digital-single-market/en/modernisation-eu-copyright-rules>

2792 See discussion above. What is problematic with these agreements, from a competition law perspective, is that they are vertical and that they are a no-go for many competition authorities and economists. Indeed, in accordance with vertical or licensing guidelines, it would be difficult not to have such covenants accepted under competition law.

2793 See for example the new Directive 2016/943/EU of 8 June 2016 on the protection of trade secrets.

tar firms, to choose between platforms, cloud service providers, enhancing competition and lessening network effects, while it may cause new e-ecosystems to develop.

Moreover, if a porting right covers the datasets, access is more likely to be granted within a contract (e.g., a license agreement). In the realms of open data, under the PSI directive, re-users extract and purchase data under database license agreements, from the public sector bodies that collected the data.²⁷⁹⁴ The re-users, often data brokers, prefer that set-up, compared with being granted access to data available on a website, without an agreement. Indeed, they want the public sector bodies to have some rights to base the transaction on, even though this means that they have to pay a license fee. They would thus rather enter contracts in reference to datasets. Otherwise, they run the risk that the data collected will be put on a website for anyone to download, and will not have the possibility to enter into special agreements with clauses (e.g., warranties) regarding quality or just-in-time delivery of real-time data, etc. Commercial transactions can thus also increase the value for those buying services.

In this way, if device producers are given a porting right to datasets, this spurs commercialisation, quality in data and the incentive to contractually agree on the means of distribution. This may potentially benefit re-users vis-à-vis the cloud providers and system leaders.²⁷⁹⁵ If a platform or cloud provider would purchase access to the data provided by a brick-and-mortar firm, that would empower the device producers.

Notwithstanding the above, an exclusive property system also implies that the inventor may refuse access to the property. Thus, it can make knowledge scarce and therefore more costly. In comparison, the ability to price and decide what to do with property is circumscribed in a liability system where the property holder may not refuse access.²⁷⁹⁶ In reference to data, especially when dealing with specific generic data points, an exclusive right to refuse access may cause large problems. Several firms collecting data will, in the IoT, hold the same data due to 'multi-homing'. Multi-homing is the practise of obtaining, or having the possibility to obtain, the same data from several sources. Indeed, it would not be possible to have exclusive rights to individual data points. However, a right to transfer or port data is, in a sense, a limited property right when the holder has a right to transfer the dataset, but no right to the individual data stored in the database. Indeed, it is rather an limited right to a dataset, under certain circumstances.

Such a right could thus include a mandatory rule enabling porting of the database or dataset, when it is in a cloud provided by a cloud service provider, this combination could be key to commercialisation and interoperability in data and datasets, and could lessen

2794 Lundqvist, 'Turning Government Data into Gold': The Interface Between EU Competition Law and the Public Sector Information Directive – With Some Comments on the Compass Case', (2013) 44(1) I I C – International Review of Intellectual Property and Competition Law, 79-95.

network effects. Ownership of individual data points should be avoided.²⁷⁹⁷ Otherwise, significant hold-up problems may appear. Furthermore, the cloud service provider should not have any right to the database under the database protection envisioned here, as only firms storing dataset with third parties – at arm's length – would retain the right to transfer datasets. Such porting rights being mandatory in the sense it cannot be contractually eroded or derogated from.

A porting right could allow customers to change cloud providers and to promote interoperability on the internet. It will force the e-platforms and system leaders to adopt technical standards so as to enable interoperability, and thereby enhance competition between e-ecosystems.

So, in reference to datasets comprising data, can a porting right be imagined? In the run-up to the recently published draft regulation for the free flow of data, the EU Commission did imagine a porting right for undertakings, regarding non-personal data.²⁷⁹⁸ The Commission impact assessment addressed the issues that providers of cloud services or other digital services distort competition and prevent free movement of data by preventing or obstructing companies from switching providers. It was therefore rather surprising that the proposal contained only a call for self-regulation regarding the right to port data (Article 6).²⁷⁹⁹ Indeed, when the proposal was published, the Commission left it to the industry to self-regulate the issue of porting rights. The industry should agree on contractual stipulations in reference to this issue and, moreover, create technology interoperability in reference to porting data, i.e., technical standards to enable porting. The question is whether that is a workable solution. Indeed, the parties of this industry might be too divided and there are few workable standard-setting organisations that include the whole industry. It doubtful that the proposed call for self-regulation will be adhered to.

By not proposing a right to port data, the Commission also opens for Member States to introduce some kind of right to non-personal data. The Commission states that there is support in France and Estonia for introducing a right to port data. The Commission does not disclose the discussion in Germany about creating an intellectual property right for device producers in regard to non-personal data. The German discussion also includes

2797 Joseph Drexler, 'Designing Competitive Markets for Industrial Data – Between Propertisation and Access'(October 31, 2016). Max Planck Institute for Innovation & Competition Research Paper, No. 16-13, 17 et seq. Available at SSRN: <https://ssrn.com/abstract=2862975>

2798 European Commission, Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions SWD (2017) 2 Final, COM(2017) 9 Final, 13; European Commission, Commission Staff Working Document on the free flow of data and emerging issues of the European data economy, COM(2017) 9 Final, 10.1.2017, 33, making reference to the works of Herbert Zech who claimed that the right way forward is the creation of a property right to non-personal goods. Cf. Zech, 'Information as a tradable commodity', in De Franceschi (ed), *European Contract Law and the Digital Single Market*, 2016, 51-79.

2799 Moreover, in a regulation which otherwise stipulates hard rules and prohibitions for Member States to create or maintain barriers to the free movement of data, it is asymmetric to include only a plea to the private actors to self-regulate in order not to minimize or prevent competition and free movement of data. This prevents coherence between the requirements of free movement and the requirements under competition law. Ibid.

negative rights and a right to port data.²⁸⁰⁰ Would Article 6 in the proposed Data Free Flow Regulation pre-empt Member States enacting porting rights for data under EU Law? There is room to argue that the EU has not with a call for self-regulation exercised its competence, which would give room for Member States to act.

According to the Commission, one of the main reasons for not creating a right to port data was that the interface between such a right and *sui generis* database protection, trade secret protection and other intellectual property rights covering data was not fully investigated.

10.9.3. Technological solutions: blockchain based IoT and Industry 4.0.

One of the main problems of the current organisation of the digital economy is the central role of digital intermediaries – digital platforms which harvest and possess different sorts of data to which they may decide, or not, to provide access. Hence, for any transaction between A and B, the data concerning this transaction is collected by a digital intermediary, which facilitates through its technology and platform the exchange. However, it may be possible to imagine that this ‘third-party’ is not a platform but constitutes a decentralised option.

Blockchain or Distributed Ledger Technology (DLT) is set to become the ‘Internet of value’²⁸⁰¹ that will complement the current Internet architecture, albeit on very different principles. Blockchain constitutes a technology facilitating the exchange of value in a secure and decentralized manner, without the need for an intermediary. Its main components are a distributed ledger recording all transactions or assets that are part of its domain, encryption protecting this ledger from tampering, and distributed storage of all data through the sharing of excess drive and network capacity on PCs and in data centers. By promoting decentralisation and disintermediation Blockchain enables will challenge the current centralised architecture of the Internet. DLT relies on protocols and services that have the capacity to implement their own systems of rules on the basis of ‘smart contracts’. These ‘self-contained systems’ operate autonomously, governed by *lex cryptographia*²⁸⁰², and are designed in such a way that they cannot be altered by any single party, and thus are not in principle, subject to interaction power. These systems enable new forms of social interactions and commercial activity, with less of a need for centralized coordination.

De Filippi, ‘Decentralized Blockchain Technology and the Rise of Lex Cryptographia’ (2015) available at: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2580664.

Hence, while in the digital platform model only the centralised online platform collects information about past transactions, blockchain offers a distributed decentralised ledger, which keeps a complete record of all past transactions on the network. This enables all participants to have access to information about past transactions and, thus, ensures that no participant to the network enjoys a position of superior bargaining power due to informational asymmetries. This equality is furthered by the transparency of the process: each new transaction is broadcast to the entire network and each participant has the power to determine its authenticity. This breaks with the centralised data silos model of the platform economy, where only some actors have access to this information, as all interactions between the network participants happen through them, thus, enabling them to accumulate data, which, in turn, can help them to increase their bargaining power and to erect barriers to entry.

Blockchain technology facilitates the organisation of micro-transactions. There is no need for a centralised network intermediating all transactions nor for administration costs to be incurred for each additional transaction. Blockchain may enable direct transactions to take place between the various nodes of a network, without being necessary for these to be administered from the centre of the network. This greatly reduces transaction costs. Consequently, micro-transactions that were too expensive to organise in the context of a centralised network because their value was lower than the administration costs are now, due to the much lower administrative costs of DLT, economically rational. Blockchain can thus charge lower fees than that which platforms usually charge.

All transactions that run through blockchain benefit from in-built network neutrality, to the extent that the only criterion for processing a transaction is whether the appropriate fee has been paid. Contrary to platforms, it is not technically possible for an entity to either control the traffic in the blockchain network and/or differentiate the way in which various transactions will be executed in terms of speed, quality etc. In comparison to neutrality arising from the structure of a blockchain network, for digital platforms neutrality obligations are usually mandated by law²⁸⁰³.

Once a transaction is 'mined' into a block, after a certain period of time it is nearly impossible to reverse it because it would mean that you would have to re-mine the block and all the other blocks added on top of that; this computationally intensive operation would incur high costs that would likely be disproportionate to the value of reversing the original transaction. Transactions in blockchain thus become irreversible, and this reduces the risk of manipulation of the data by an operator, a risk that is very much present with regard to digital platforms.

Everybody can check the public ledger and verify whether the transaction took place or not, the identity of the sender and the locations between which the value was transferred. The transparency of the blockchain offers significant advantages to platforms

2803 See, for instance, the 2017, Google Search (Shopping) competition law Case AT.39740 in the EU, regarding search neutrality, or the Proposal for a Regulation of the European Parliament and of the Council on Promoting Fairness and Transparency for Business Users of Online Intermediation Services, 2018/0112 (COD), imposing neutrality requirements in the way digital platforms treat other websites and other businesses with regard to ranking etc.

when organizing a network of transactions, as transparency generates institutions-based trust, without that being based on the power of control exercised by an intermediary, as it is the case in platform-based networks. This has also profound implications as to the ability of each participant to this network to feel as though they are in control. One of the main features of blockchain-based applications is that users have absolute ownership of their assets (e.g. money, data etc.) without the need for any kind of custodian (e.g. banks, online intermediaries etc.). Thus, once someone generates a private key, no other person can claim the assets, confiscate them or deny access to them.

An important feature of blockchain is that information is distributed in a decentralised ledger and it is possible for anyone (in the case of public blockchain), or for a number of participants (in the case of a permissioned blockchain) to have access to it, particularly if they decide to switch to a different platform or blockchain ‘fork’. Contrary to centralised platforms, where users are averse to switching, the replicability of data makes it easier for blockchain to switch to competing forks and abandon the older version of the blockchain²⁸⁰⁴. This has also important implications for indirect network effects, as blockchain developers (writing apps) and blockchain operators (e.g. miners) also have less reasons to be anchored to a specific platform. It is in their interest to be among the first to contribute to a fork because if such were to attract a considerable number of existing users, in particular at the initial stages of its development, rewards (for mining) may be very high. Hence, the expansion of the use of blockchain may challenge the dominance of digital platforms by denying them the possibility to hold huge amounts of data that constitute a barrier to entry and also reinforce their central position in the ecosystem. In contrast in a blockchain data is held by those contributing it. These may transact directly with each other through the decentralized ledger.

Blockchain will have of course implications on the IoT. The transition from smartphones to the IoT where millions of devices will get direct Internet connectivity including thermostats, refrigerators, cars etc. will increase the means through which companies may get access to valuable consumer data. One of the possible uses of blockchain technology and associated cryptocurrencies is that it could be to become the backbone of the machine-payable web, i.e. machines communicating, sharing processing power and exchanging value with each other, and the base layer connecting the different industries. IOTA²⁸⁰⁵ is the first cryptocurrency designed to power the IoT revolution. It enables the secure sharing of resources between smart devices with zero transaction fees. IOTA has also been used as the underlying ledger for transferring information during the production process in Industry 4.0 projects, while also leading to a tamper-proof audit trail.

10.10. Conclusions

This chapter looked at the development of IoT environment and challenges it will bring. As BRICS countries are increasingly adopting IoT solutions, two particular obstacles will need to be overcome. One relates to licensing SEPs that are necessary for the use of infrastructure standards, and the other relates to access to data necessary for the seamless functioning of IoT devices.

Disputes concerning the licensing of SEPs are no longer only US or EU phenomenon, large high technology companies are increasingly using BRICS countries as a venue for litigation. Issues that will need to be clarified include the availability of injunctions for the infringement of SEPs, methodologies for calculating FRAND royalties and potential anti-competitive practices by SEP holders. Practices in the EU or US may serve as an inspiration, but BRICS countries may also consider adopting guidelines for a workable SEP licensing framework, which should take into account and protect the legitimate interests of both SEP owners and standard implementers.

Regarding access to data, BRICS countries are yet to introduce appropriate measures in this area. In the absence of specific legislation, we have seen that competition law may potentially apply to force dominant companies to share data, but competition law is inadequate as a general framework for regulating access to data. We have also seen that introduction of data producer's rights may also not be a feasible alternative, due to complexities in its implementation and the general need to secure more access, not more exclusivity. Instead, a way forward may be in providing sector-specific data access regimes and encouragement of the formation of data pools where companies would voluntarily exchange data. However, care must be taken to also ensure privacy of individuals and compliance with data protection rules

Looking ahead, new technologies would require new creative solutions. We might consider promoting the applicability of blockchain technology as a means to foster data sharing as well as the creation of more open interoperability standards. It remains to be seen whether companies and governments are ready for adopting more creative approaches.

Chapter 11: Privacy Restrictions as Restrictions of Competition

Nicholas Economides & Ioannis Lianos

11.1. Introduction

The recent controversy on the intersection of competition law with the protection of privacy, following the emergence of big data and social media is a major challenge for competition authorities worldwide. The concept of ‘big data’ is usually employed to refer to gigantic digital datasets, which are often held by corporations, governments and other large organisations, and which are extensively analysed using computer algorithms.²⁸⁰⁶ Breaches of privacy or data protection may affect millions of people and, depending on the purpose, even compromise the democratic process.²⁸⁰⁷

Although the tracking of webpages visitors exist since the early days of the Internet, with the rise of social media and Web 2.0, it is technologically possible for third-party websites to be embedded into the visited website through references to external resources to the website, such as a JavaScript code, which the user’s browser will automatically load from the third-party server, and execute²⁸⁰⁸ Data can be harvested by digital platforms across different devices such as smartphones, tablets and laptops/computers, for instance with regard to websites the user has interacted with (first data aggregator), or from other entities, through third party tracking, the tracker harvesting data not directly from the user, but indirectly through access to the data aggregated by the first data aggregator. According to a study published by Ghostery in 2017, more than 77% of all page loads contain at least one tracker, for statistical or advertising purposes, Google being found on more than 60% of all page loads, and Facebook on more than

2806 ‘Aspects of ‘big data’ that are often mentioned are large amounts of different types of data, produced at high speed from multiple sources, whose handling and analysis require new and more powerful processors and algorithms’: Autorité de la Concurrence & Bundeskartellamt, Competition Law and Data (May 16, 2016), 4. ‘Big data’ is often characterized <https://www.theguardian.com/news/2018/mar/17/cambridge-analytica-facebook-influence-us-election> by the various ‘V’s’, which go from four, according to certain descriptions, Velocity, Variety and Volume, Value (to be extracted) to six, according to others adding Veracity and Validation.

2807 See, the recent controversy concerning the use of Facebook generated data from Cambridge Analytica, a political strategy firm, for uses for which Facebook’s clients had not provided their consent, in particular in order to design algorithms that enabled Cambridge Analytica to build a system that could profile individual voters in the 2016 Brexit referendum, as well as the 2016 US Presidential election, in order to target them with personalised political advertisements and influence their votes. See, <https://www.theguardian.com/news/2018/mar/17/cambridge-analytica-facebook-influence-us-election> ; <https://www.politico.eu/article/cambridge-analytica-chris-wylie-brexit-trump-britain-data-protection-privacy-facebook/>.

2808 S. Schelter & J. Kunegis, Tracking the Trackers: A Large-Scale Analysis of Embedded Web Trackers, Proceedings of the Tenth International AAAI Conference on Web and Social Media (ICWSM 2016), available at <file://ad.ucl.ac.uk/homea/uctlio/ Documents/EPANT/13024-57897-1-PB.pdf>.

27%, followed by Comscore, Twitter and Yandex.²⁸⁰⁹ However, it has also been reported that the implementation of stricter data protection regulation, such as the GDPR, has led to a decrease of the usage of third-party cookies and third-party domains.²⁸¹⁰ Tracking capabilities are also concentrated in a few number of companies, with Google holding most power, in terms of reach of a tracker on popular websites and apps, in both websites and apps, followed by Twitter, Facebook and Microsoft for websites trackers, and Amazon, Facebook and Comscore for mobiles trackers.²⁸¹¹ The recent consolidation of the tracking analytics industry with the mergers of Microsoft/LinkedIn (2016), Adobe/Lyvefire (2016), Facebook/Liverail (2014), Alibaba/Umeng (2013), Google/DoubleClick (2007), has also contributed to the emergence of a market structure dominated by a small number of firms, and a long tail of less significant trackers.²⁸¹²

Furthermore, data (or information) intermediaries (brokers), such as Axciom and Equifax, package information from various sources to profile customer groups. This profiling has historically aided targeted advertising. Advertisers are building campaigns based on geographies, socioeconomic factors, age, government data, same-store sales, etc. The internet spawned new variants of data brokers. Traditional intermediaries collect outcomes data on several dimensions, such as same store sales and credit history. Marrying raw purchasing history (harvested by traditional intermediaries) with ideation (with prediction platforms such as Facebook/Google) may easily build a digital customer journey. Basic statistical models would be able to determine *when* to advertise to individuals to maximize conversions. In this way, payments become far more important for future advertising revenue. Statistical models could separate window shoppers and day dreamers from serious shoppers. While this discourse focuses largely on payments, it extends to other decisions made by consumers.

Recent technological progress in data analytics may also greatly facilitate the prediction of personality traits and attributes from even a few digital records of human behaviour, such as 'likes' or facial images on Facebook,²⁸¹³ while inferring identities, such as social security numbers, from anonymised data has been possible for some time.²⁸¹⁴ The development of smart cities (with extensive networks of sensors) and technologies such as artificial neural networks enable better predictions of both actions as well as behaviours of smart cities' users, or even the formation of new social ties, through better modelling

and simulation.²⁸¹⁵ Digital technology facilitates the elaboration of advanced (even real-time) sociometrics and new applications, such as social credit experiments.

There are different perspectives globally as to the level of personal data protection and the role competition law may play in this context.

The EU, as well as its Member States, are one of the most active jurisdictions in this context, to the extent that there is a fundamental right to privacy²⁸¹⁶ and the establishment of an elaborate system of data protection, most recently with the implementation of the General Data Protection Regulation (GDPR) and related legislation.²⁸¹⁷ The fundamental principle of the GDPR is the requirement to have a 'legal basis' for all processing of personal data (although this does not cover 'anonymous' data)²⁸¹⁸, six legitimate grounds being mentioned, including the requirement of explicit consent by the data subject. The GDPR obligations apply to 'controllers' which can be natural or legal persons, irrespective of whether their activity is for profit or not, irrespective of their size and whether they are private law or public law entities. Among the rights conferred to data subjects is the right to data portability, individuals having the right to receive free of charge their personal data which they provided themselves on the basis of contract or consent in a 'structured, commonly used, and machine-readable format' and to transmit the data to another controller.

In the US, the California Consumer Privacy Act (CCPA) 2018²⁸¹⁹, and a number of sector specific data and privacy protection regimes, have been enacted at both federal and state levels. The CCPA has similarities with the GDPR, but a more limited scope. It applies only to for profit organizations (businesses) having an annual gross revenue in excess of \$25 million and doing business in California (although a business established outside of California may also fall within the personal scope of application if it collects or sells

2815 See, M. Batty, K.W. Axhausen, F. Giannotti, A. Pozdnoukhov, A. Bazzani, Smart cities of the future, (2012) 214 The European Physical Journal 481; A. Almeida & G. Azkune, Predicting Human Behaviour with Recurrent Neural Networks, (2018) 8(2) *Applies Sciences* 305.

2816 Article 7 of the Charter of Fundamental Rights lays down the right to respect for private and family life, home and communications, protecting the individual primarily against interference by the state.

2817 Article 8 of the Charter of Fundamental Rights recognises the protection of personal data as a separate right, which goes beyond simply protecting against interference by the state, but entitles the individual to expect that his or her information will only to be processed, by anyone, if however this processing is fair and lawful and for specified purposes, that it is transparent to the individual who is entitled to access and rectification of his/her information. The rights must also be subject to control by an independent authority. Article 16 TFEU requires rules to be laid down relating to data protection and to the free movement of such data in the internal market. The EU has adopted General Data Protection Regulation (EU) 2016/679 the protection of natural persons with regard to the processing of personal data and on the free movement of such data [2016] OJ L 119/1, which applies from 25 May 2018. Its scope is significant and wide-ranging. For a commentary, see O. Lysnkey, The 'Europeanisation' of Data Protection Law, (2017) 17 *Cambridge Yearbook of European Legal Studies* 252. See also, Directive 2009/136/EC of 25 November 2009 (Cookie Directive) [2009] OJ L337/11; Directive 2002/58/EC of 12 July 2002 concerning the processing of personal data and the protection of privacy in the electronic communications sector (ePrivacy Directive) [2002] OJ L201/37.

2818 Recital 26 of the GDPR defines anonymous information, as '...information which does not relate to an identified or identifiable natural person or to personal data rendered anonymous in such a manner that the data subject is not or no longer identifiable'.

2819 See <https://www.ccaprivacy.org/>.

California consumers personal information while conducting business in California). It also excludes from its scope the processing of some categories of personal information (e.g. medical information and protected health information). 'Aggregate consumer information' also does not benefit from protection. In contrast to the GDPR, the CCPA does not require a 'legal basis' for all processing of personal data, nor the establishment of accountability requirements, such as the appointment of Data Protection Officers, as required by the GDPR. The right to opt-out is only available in the case of selling or sharing personal information, and does not apply to the harvesting of personal information, as it is the case in the EU, which covers all 'processing' of information. The CCPA does not include a list of grounds that businesses must adhere to a priori but relies on a *posteriori* mechanism, allowing consumers to opt-out to the sale and disclosure of their personal information or to request the erasure of the information. If the consumer opts out, then an explicit permission is required for the sale and disclosure of this personal information. The right to data portability is also recognized as forming part of the right to access of the consumer to her data free of charge but only applies to data collected in the previous 12 months.

Similarly, privacy and data protection provisions exist in several BRICS jurisdictions.²⁸²⁰ In Brazil, the recently enacted in August 2018 General Data Protection Law (Law n. 13.709/2018) is inspired by the European regulatory framework, may be applied extra-territorially, and relies on consent of the individual.²⁸²¹ In Russia, the Law On Personal Data provides the normative basis for the process of personal data collecting, storing and processing, again on the basis of the principle of consent by the data subject.²⁸²² In contrast to the GDPR and the CCPA, it does not include however the right to data portability. In India, the Supreme Court declared in *Justice KS Puttaswamy And Another Vs. Union of India and Ors*, the 'right to privacy' to be part of the fundamental 'right to life' under Article 21 of the Constitution of India²⁸²³ and a draft Personal Data Protection Bill (PDPB) was suggested by the government in July 2018, and is still in consideration. It relies on the concept of explicit consent of the data subject and aims to protect the autonomy of individuals in relation with their personal data. The Bill includes a right to data portability.

The situation is different in China where, in the absence of a regime of data protection and a right to privacy, legal practice tends to apply *The Law against Unfair Competition* to provide ultimate protection when no protection can be sought elsewhere. In China, data protection mostly refers to data security and does not encompass privacy concerns. One may nevertheless observe the gradual emergence of other paths for the protection, in particular a property rights protection for data. Digital property rights holders may protect their property rights and interests in accordance with the provisions of the *Property Law*, the *Intellectual Property Law*, the *Law against Unfair Competition*, the *Tort*

2820 For a more detailed discussion, see the relevant country reports.

2821 Law n. 13.709/2018, known in Portuguese as Lei Geral de Proteção de Dados – "LGPD."

2822 TheFederalLaw'OnPersonalData'dated7July2006No.152-FZ<<http://pravo.gov.ru/proxy/ips/?docbody=&nd=102108261>> accessed 28 February 2019.

2823 https://www.sci.gov.in/supremecourt/2012/35071/35071_2012_Judgement_24-Aug-2017.pdf

Liability Law, etc. depending on the nature of their different properties. However, no consensus has been reached yet on the legal nature of digital assets in China, such as industrial data and personal information.²⁸²⁴ In South Africa, the right to privacy is protected by the common law and section 14 of the Constitution. Personal data protection is further provided by the Protection of Personal Information Act, No 4 of 2013 (POPIA), although it is not yet in effect. As the GDPR it applies to the processing of personal data and prescribes eight specific principles for the lawful processing and use of personal information. In particular, any transferring of personal information across borders without any legal basis, including the prior consent of the party whose personal information was processed.

In addition to this emerging field of data protection, in recent years, the digital sector has attracted the attention of some competition authorities and regulators involved in data protection, which advanced the need for a more connected approach between these two areas of law, aiming to avoid the exploitation of the personal data of consumers and restrictions to their privacy,²⁸²⁵ although the theoretical underpinnings may be different. Indeed, data protection and privacy regulations often take a fundamental rights perspective, seeing privacy as an issue of rights. Both the GDPR and its predecessor were inspired by a fundamental rights based approach as data protection and the right to privacy are protected by the Charter of Fundamental Rights of the EU – Articles 7 and 8. A distinction is also made between privacy, which is formally protected and cannot be traded, and data which can be traded following consent by the data subject. However, no existing data protection regulation establishes a property right on personal data, and confers that to the data subjects. Although the GDPR seems to be inspired by some property-like rights logic when it introduces the principles of data portability and the right to be forgotten, it stops short from recognizing property rights on data.²⁸²⁶ The rule is that data can be possessed by the entity collecting it without any property right being affected. As a result, platforms have been able to harvest data and therefore possess data, without the users detaining any property right on their data. A property right would involve the use as well as the possibility to sell data and license it to someone for profit, or use the data as security/collateral for raising capital, as it is the case with intellectual property rights. Although data could be considered as an intangible asset which may be protected by property rights, this is not presently possible with personal data.²⁸²⁷ The exploitation of personal data certainly creates value, however this is entirely,

or overwhelmingly, captured by the entities (e.g. digital platforms) harvesting this data. In contrast, competition law usually takes a market failure approach, and is concerned by the fact that consumer or total welfare, or well-being, may suffer from reduced data protection in a malfunctioning market for personal data acquisition, to a similar extent that it could suffer from higher prices or lower quality. In addition,, to fit better with the welfarist foundations of the economic approach in competition law, although one may also envisage the possibility of a rights-based framework,²⁸²⁸ a market failure approach may provide common intellectual foundations for the assessment of harms associated to the exploitation of personal data, even when the specific legal system does not formally recognize a fundamental right to privacy. It may also provide the possibility of a more unified approach on theories of harm for both competition law and data/privacy protection. For this reason, we argue for a market failure approach, although we also recognize that there is value in protecting personal data and privacy from a fundamental rights' perspective and in any case that the two approaches are not mutually exclusive but may, and have already been, combined in order to provide the highest levels of protection.

We present a model of market failure based on a requirement provision in the acquisition of personal information from users of other products/services of Google and Facebook. We establish the economic harm from the market failure and the requirement using the traditional competition law toolbox. Eliminating the requirement and the market failure by creating a functioning market for the sale of personal information is imperative.

Besides the traditional analysis of the requirement and market failure, we note that there are typically informational asymmetries between the data controller and the data subject. The latter may not be aware that his data was harvested, in the first place, or that the data will be processed by the data controller for a different purpose, or shared and sold to third parties. Maybe there was no consent for such use, or, if there was consent, it may not have extended to third parties' use. The exploitation of personal data may also result from economic coercion, on the basis of resource-dependence or lock-in of the user, the latter having no other choice, in order to enjoy the consumption of a specific service provided by the data controller or its ecosystem, than to consent to the harvesting and use of his data. A behavioural approach would also emphasise the possible externalities (demand-side market failures) coming out of the bounded rationality, or the fact that people do not internalise all consequences of their actions and face limits in their cognitive capacities. Hence, a user may consent on the harvesting and use of his data, without necessarily realising the full consequences and costs of his choice. This may occur in the context of an exchange in which the user is offered a free product in exchange of his data.

2828 For a discussion, see, with regard to the right to food, I. Lianos & A. Darr, *Hunger Games: Connecting the Right to Food and Competition Law* (June 1, 2019). Available at SSRN: <https://ssrn.com/abstract=3414032> or <http://dx.doi.org/10.2139/ssrn.3414032>.

Dan Ariely advances the concept of ‘zero-price effect’, suggesting that people associate free products with pleasure, when making decisions under System 1 (intuitive decisions).²⁸²⁹ Some recent neuro-economics research also links payment for a product with pain, arguing for instance that consumers may react differently to the ‘pain of paying’ and that credit cards ‘anesthetize’ the pain of paying.²⁸³⁰ This research illustrates how decisions over providing access to personal information may be welfare or well-being reducing for individuals and that the requirement of consent, as it is set in data protection law, may not necessarily fully preserve their interests.

By recognizing that there is a market failure in the acquisition and exploitation of user information, we identify a wider problem that the issue of unauthorized harvesting and use of personal data. This may result even from conduct that, at first sight, could appear as increasing consumer surplus. For instance, advertised-based platforms, such as Google and Facebook provide free search in exchange for acquisition of private user information. Not only these companies benefit from market power, to the extent that they control the most popular search engine and social media platforms, but also their users are locked-in since they face costs of switching to rival products. Furthermore, there are considerable information asymmetries resulting out of the opaque and constantly changing data and privacy policies, as well as the fact that users are not aware of the extent of companies’ surveillance. In addition, these companies exploit consumers by offering a ‘zero price’ in terms of monetary transaction for their product, although this ‘zero price’ may be arbitrary and may underline the market failure in the acquisition of private user information. Present privacy regulations ignore this market failure as they are based on the ‘rights’ of users but ignore that there is something fundamentally wrong with this ‘market.’ The Chapter first engages with the different types of market failure, before addressing the way competition law has dealt and could engage with exploitative and exclusionary conduct leading to privacy harm. The final part provides some thoughts on possible remedial action, also beyond the strict confines of competition law. The Chapter does not engage with other forms of user harm that may result from anticompetitive conduct by platforms, such as deterioration of the quality of search query results,²⁸³¹ or excessive prices extracted from advertisers.

11.2. Privacy and Market Failures

Digital markets are affected by different types of market failure that may impact on their optimal performance with regard to delivering privacy for their users. These market failures may result from the strategies employed by large digital platforms. We present

a model of market failure in the acquisition of personal information from users of other products/services of Google and Facebook arising from the requirement of these platforms that users provide their personal information if they use the company's service. We establish the economic harm from the market failure and the requirement using the traditional competition law toolbox. Eliminating the requirement and the market failure by creating a functioning market for the sale of personal information is imperative. Besides the traditional analysis of market failure, we note that there are typically other types of market failures, such as consumers' lock-in, information asymmetries, missing markets enabling users to learn the value of their data, and behavioural biases. As we have explained in Chapter 4, data protection legislation offers a partial response to this exploitation of the privacy and data of the users, to the extent that it does not take into account, in designing its remedial strategy, all the possible long-term harms to the platforms' users, the power of some digital platforms and the 'special responsibility' that may ensue from such positions of power. Competition law theories of exploitation and exclusion can provide a good complement to data protection law in this context.

11.2.1. Market failures through exclusionary and exploitative requirement contracts bundling digital services with personal data

The antitrust concerns for advertising-based platforms, such Google and Facebook, are similar. Both companies allow free access to their respective service in return for the user granting free access to his/her personal information. This information includes IP address, cookies, location, search history and possibly parsing of emails for Google and user posting and user "likes" history for Facebook. Data collection by the companies occurs with "no questions asked" since the default is to "opt-in" in the collection processes of both companies. The default opt-in and the zero price in data collection constitute a *market failure*. That is, the market between the user and company on acquisition of personal data does not function properly as a market, and everyone participating in Google Internet search or Facebook service is giving their personal data for free. If the default were opt-out rather than opt-in and the market for data acquisition was properly functioning, users would receive various amounts of monetary compensation from the companies depending on each user's features.

Google offers free Internet search and effectively requires data provision by the user at zero price. That is, it offers Internet search *only if* the user provides data. This setup is restrictive to consumers especially those who might be willing to pay for Google service but would prefer not to share their personal information with the companies.

Imposing the requirement of personal data provision to receive Internet search increases Google's market power in the data market. A user who would not have freely given his/her personal data to Google is now doing so because this is a requirement to access Google's Internet search. Thus, this requirement increases Google's market share in the data market. Since such data is used to sell ads, Google's requirement directly increases its market power in the ads market, and stifles competition in this market. This claim

is uncontroversial. As a recent ACCC shows, Google and Facebook possess substantial market power in several markets, including in online search, online advertising and news media referral as ‘gateways’ to online publishing.²⁸³²

To the extent that users receiving free search do not receive in kind the full compensation for the data they provide, they are harmed by the requirement practice. Additionally, there are users who would prefer to pay for search and not to provide their personal data to Google. They are also harmed by being compelled to provide personal data under Google’s requirement.

Similarly, Facebook provides free access to its service and requires data provision at zero price. It offers Facebook service only if the user provides access to personal data. Imposing the requirement of data provision to receive Facebook service increases Facebook’s market power in the data market. A user who would not have freely given his/her personal data to Facebook is now doing so because this is a requirement for access to Facebook service. Thus, the requirement increases the market share of Facebook in the data market. Since the data is used to sell ads, Facebook’s requirement directly increases its market power in the ads market, and stifles competition in this market. To the extent that a user is not compensated adequately for his personal data by the free provision of Facebook service, he is damaged by the requirement practice. Additionally, there are users who are willing to compensate Facebook for its service but would prefer not to provide their personal data to Facebook, who are damaged under Facebook’s requirement.

How would the world be without this requirement? First, the default regime would be “opt-out,” likely imposed by regulation since Google and Facebook do not have incentives to change the present opt-in default regime. In the opt-out regime, the company (Google or Facebook) is unable to legally use or sell the information it collects from a user who has not opted-in. To be able to use or sell information the company collects from a user, the user would need to affirmatively give his/her consent by opting-in. The user may demand compensation or be offered compensation for selling his/her data to the company, and opt-in occurs when a price has been determined and money changes hands.

So, a potentially vibrant market for personal information sold to Facebook or Google has been killed through the requirement practices of Facebook and Google that impose provision of personal data as a requirement for access to Facebook service or Google Internet search service. This is a “market failure” and can be fixed by antitrust and competition authorities in the US, EU and around the world. This goes beyond privacy concerns on the acquisition of personal information that are typically based on “rights” of individuals (for example, see *General Data Protection Regulation*, GDPR of the EU) rather than failure of markets and antitrust violations.

We now briefly describe how the market for sale of personal user data may function once we depart from the arbitrarily-imposed zero price and the present market failure.

2832 For an in depth analysis of this question, see ACCC, Digital Platforms Inquiry (June 2019), available at <https://www.accc.gov.au/system/files/Digital%20platforms%20inquiry%20-%20final%20report.pdf>, 8-10 & 89-99.

We expect that there is plenty of variation both in the company's willingness to pay for users' personal information and in the users' reservation price for the sale of their personal information; of course there is also variation in the willingness to pay for Google (or Facebook) service. In a competitive world, we would expect two different markets. In the case of Google the two markets would be, market one for Internet search, and market two for acquisition of personal information by Google. Similarly, for Facebook, the two separate markets would be, market one for Facebook social network service, and market two for acquisition of personal information by Facebook. When combining the total charges in the two markets, that is, price collected by Google (or Facebook) in market one minus price paid by Google (or Facebook) in market two, we expect that some users would end up paying a positive price for Google (or Facebook) in total, some would be paid by Google (or Facebook) in total, and some would receive break even in total.

Additionally, issues of market operation and allocative efficiency arise because of Google's and Facebook's dominance in their respective markets. Even in a "default opt-out" regime, because of its market dominance, Google (or Facebook) can overcharge users or not pay them the competitive price to provide personal information.

Our exposition uses Google as the dominant firm imposing the requirement, but this narrative can be easily adapted to Facebook. A user *type* may be defined by a triplet of dollar amounts (x, y, z) with variation across users in x , y , and z . We define the amount $\$x$ as how much the user is willing to pay to use Google Internet search. That is, x is the private value/utility for Google search for the particular user and, in general, $x > 0$. We define $\$y$ as how much Google is willing to pay this particular user to induce him/her to voluntarily provide his personal data to Google (in the absence of the requirement). That is, $\$y$ is the value to Google of the personal data that the user provides to the company, and, in general, $y > 0$. We define $\$z$ as the value to the user of giving his/her private information to Google and losing his/her privacy. We will assume that $\$z$ is positive, and we will count $-z$ as a loss for the user if his/her private data is given to the company.

We consider the following three regimes. First, the *current requirement regime*, "opt-in," where the personal information of the user is automatically/readily available for use by the company, and the company requires personal data provision to provide Internet search. Second, the world with *no requirement regime with competition in the personal data market*, where Google has the possibility to perfectly price discriminate to induce the user to sell his/her personal information. In this world, the default is opt-out, which means that the company is not allowed to use any information gathered from the user unless the user affirmatively consents, and there is no requirement to provide personal information to access the search service. In this regime, we assume that Google competes with other firms in search and also faces competition in the personal search market. In the latter, all rivals are very well informed on the features of the user and can practice perfect price discrimination. In the third regime, the default is opt-out and Google is a perfectly price discriminating monopsonist in the acquisition of personal user information. This is a *no requirement regime with a perfectly price discriminating monopsonist*.

We assume that, when a user does not use search and does not provide data, he/she receives a benchmark utility normalized at zero, $U = CS = 0$. Similarly, if there is no provision of personal data by the user, Google's benefit is normalized at $G = 0$. We will measure changes in utility and consumer surplus in the various actions and regime changes from these benchmarks. We assume that Google has zero marginal cost in search.²⁸³³

We first analyse the *current requirement regime*. We have Google as a dominant firm, default "opt-in," and personal data provision is required to receive Internet search. In this regime, when the user accepts the requirement, he/she has utility and consumer surplus

$$U = CS = x - z,$$

since the user receives $\$x$ utility from using Google's search services and incurs a loss of personal privacy worth $\$z$ to him/her. Provided that the value from the use of Google search is higher than the user's cost of loss of privacy, $x > z$, the user accepts the requirement of Internet search to him and personal data provision to Google. Google receives an incremental benefit G equal to $\$y$, the value of the user's data to Google, $G = y$. In summary, in the present requirement regime under default opt-in, when a user accepts the requirement, the benefits to the user and Google are:

$$\text{If } x > z: U = CS = x - z > 0, G = y > 0.$$

If the benefit to the user from search is smaller than the cost of losing privacy, $x < z$, the user does not accept the requirement, does not use Google search, does not provide data to Google, and stays at zero utility. Google receives zero benefit as well.

$$\text{If } x < z: U = CS = 0, G = 0.$$

The current requirement regime results are summarized in Table 1.

Table 11.1: Present Regime: Default opt-in, Google provides search only if it collects personal data

		Benefit to user	Benefit to Google
$x > z$	User accepts the requirement, uses search and provides personal information	$U = CS = x - z > 0$	$G = y > 0$
$x < z$	User rejects the requirement, does not use search and does not provide personal information	$U = CS = 0$	$G = 0$

We now change the default to opt-out and assume that data provision is not required to receive Google Internet search. In this new regime, the user uses Google Internet search, but he does not by default give the right to Google to use his personal data. Therefore, in the *no requirement regime with competition in the personal data market*, provision of personal data is a choice of the user. Google is able to charge a price p_1 for the

²⁸³³ The marginal cost of an additional user for Google and Facebook is very low (almost zero), especially when compared to their fixed costs.

search, and can pay price p_2 to the user for personal data provision.

Rivalry among Internet search companies drives the price in the Internet search market to zero $p_1 = 0$,²⁸³⁴ resulting in

$$U = x, G = 0$$

from the participation in the Internet search market. Since the maximum benefit from personal data to Google is y , Google would be willing to pay up to $p_2 = y$ for personal data acquisition, resulting in benefit

$$G = y - p_2.$$

Once the market for personal information is open from the requirement, other firms will bid up to y to acquire the personal information of a user. Competition among them will result in each of them offering the same price y to the same user, resulting in zero benefit for each of them. Therefore, the user and Google benefits will be

$$U = x - z + p_2 = x - z + y, G = 0.$$

This strategy works as long as $y > z$.

If it happens that $y < z$, the maximum offer a company can make to induce data provision, y , will not be accepted by the user because it would result in lower user utility than when the user did not provide data, $U = x + y - z < x$ since the user had utility $U = x$ when not providing data. Therefore, if $y < z$, the user accepts no offer, resulting in

$$U = x, G = 0.$$

The results of the no requirement regime with competition in the personal data market are summarized in Table 2.

Table 11.2: No requirement regime with competition in the personal data market: default opt-out, personal data provision to Google not required to provide Internet search, competition in the personal data market

		Benefit to user	Benefit to Google
$y > z$	User provides data at price $p_2 = y$	$U = CS = x + y - z > 0$	$G = 0$
$y < z$	When the user values his personal data loss more than Google values the user's data, the user does not sell his/her personal data	$U = CS = x > 0$	$G = 0$

In summary, the number of people who trade under no requirement with competition in the personal data market expands for some types because Google offers them a positive price to induce them to sell data, but there are also types who participate under the requirement but do not participate without it. We explore this next.

²⁸³⁴ If competition is less intense, price will be xk , $0 < k < 1$, with similar results.

Table 11.3 summarizes the differences of the two regimes.

Table 11.3: Comparison of the status quo with no requirement and competition in personal data market

Parameter values	Regime	Benefit to user	Benefit to Google	Participation in personal data market, in regimes 1, 2
$x > z$	Default opt-in, requirement, and user accepts	$U = CS = x - z > 0$	$G = y > 0$	Yes, N/A
$z > x$	Default opt-in, requirement, and user rejects	$U = CS = 0$	$G = 0$	No, N/A
$y > z$	Default opt-out, no requirement, user sells info	$U = CS = x + y - z > x > 0$	$G = 0$	N/A, Yes
$y < z$	Default opt-out, no requirement, user does not sell info	$U = CS = x$	$G = 0$	N/A, No
$x > z, y > z$	Change of benefit by the removal of the requirement	$\Delta U = y > 0$	$\Delta G = -y < 0$	Yes, Yes
$x > z > y$	Change of benefit by the removal of the requirement	$\Delta U = z > 0$	$\Delta G = -y < 0$	Yes, No
$y > z > x$	Change of benefit by the removal of the requirement	$\Delta U = x + y - z > x > 0$	$\Delta G = 0$	No, Yes
$z > x, z > y$	Change of benefit by the removal of the requirement	$\Delta U = x > 0$	$\Delta G = 0$	No, No

In terms of participation in the provision of data to Google, all four possibilities arise: users who accepted the requirement and sell personal without the requirement, users who accepted the requirement and refuse to sell without the requirement, users who rejected the requirement and sell in its absence, and users who rejected the requirement and do not sell in its absence.²⁸³⁵

²⁸³⁵ To understand this better, we provide examples of the four possible cases. Consider a user with $(x, y, z) = (2, 3, 1)$. Since $y > z$ and $x > z$, the user participates under the requirement and also sells his/her data without the requirement. Similarly, with $(3, 2, 1)$: $y > z$ and $x > z$ implying that the user participates under the requirement and also sells his/her data in its absence. Alternatively, consider a user with $(x, y, z) = (1, 3, 2)$. This user would not participate under the requirement since $x < z$, but would sell his/her data in its absence since $y > z$. Also consider user $(x, y, z) = (3, 1, 2)$. Since $x > z$, he would participate under the requirement, but would not sell their personal information in its absence since $y < z$. There are also those who would not participate under the requirement since $x < z$ and also would not participate in its absence

Several observations are in order. First, users are better off and Google is worse off when the requirement is removed and there is competition in the personal data market, $\Delta U > 0$, $\Delta G \leq 0$. Users are better off because they have more choice and they are not constrained by the Google-imposed requirement. Google is worse off because it can extract less surplus from the users.

The second observation is that removing the requirement does not kill Google's business or its business model. There is a wide range of parameters for which users sell their personal data under no requirement, including some who would not participate in the market under the requirement but are won over by the positive price Google offers in its absence. The users who cannot be won over by Google in the absence of the requirement are only those who value their privacy more than Google values their data ($z > x$, $z > y$). And among those value their privacy more than Google values their data ($z > y$), there are some who were participating under the requirement, but having been freed from the requirement do not sell their data at prices Google are willing to offer ($x > z > y$).

The third observation is that the market for acquisition of personal data by Google works well and has the various features of a functioning economic market. For example, there is variation in the willingness to pay defining a demand curve, and, given an offer price by Google, some users participate in the market at the price offered by the buyer while others do not.

We have shown that a vibrant market for personal information sold to Google has been killed through Google's practice to impose provision of personal data as a requirement for access to Google's Internet search service. This is a "market failure" and can be fixed by antitrust authorities in the US, the EU, and other jurisdictions.²⁸³⁶

We have shown that users are worse off, and Google is better off under the requirement. Assuming that people can determine rationally if it makes sense to provide their data, absence of the requirement will lead to the users being paid by the digital platforms for harvesting of their data. Removing the requirement improves consumer surplus as the price of data is positive in its absence since users get paid for selling their data to the platform. Typically, this will also lead to more data being collected.

We now discuss a third regime where, after opt-out, Google remains a monopsonist in the market for personal data and then compare it with regimes 1 and 2.

In this third regime, Google is able to charge a price for search and a second price for the provision of personal data. We assume that the price for search may not fully extract the benefit of search for the user, possibly because of competition with rival browsers. So, when the user uses Google Internet search but does not allow Google to use his/her personal data, the user has a benefit $x - p_1$, where the price charged by Google for search only is $p_1 = kx$, $0 \leq k \leq 1$. $k = 1$ is the special case when Google is able to extract the full benefit of the user from Internet search. It is likely that perfect price discrimina-

since $y < z$, for example $(x, y, z) = (1, 2, 3)$ or $(2, 1, 3)$.

2836 The analysis for Facebook is very similar.

tion in the search market would not be possible, so it is reasonable to expect that k will be less than 1.

In this case, the consumer surplus and Google's benefit from the search market are

$$U = CS = (1 - k)x > 0 \text{ if } k < 1, G = kx.$$

All users will buy search from Google as long as $k < 1$.

Google offers payment p_2 to users who are willing to sell their personal data to it. Then the user's utility and Google's benefit are:

$$U = CS = x - z - p_1 + p_2 = x(1 - k) - z + p_2, G = y + kx - p_2$$

since he/she benefits from the Internet service by $\$x$, loses $\$z$ for losing privacy, pays $p_1 = kx$ for search and receives p_2 as monetary compensation from Google for selling his/her personal data. Google receives the personal data which it values at y , charges p_1 for search and pays p_2 to the user for providing that data. Therefore, the benefit to Google is $G = y + kx - p_2$.

If $y > z$, that is, if the value of the personal data of the user to Google is higher than the value of loss of privacy to the user, Google can offer up to $\$y$ and be better off than when no data is provided. Since Google is dominant and knows the user so well that it can practice perfect price discrimination in the market for the provision of personal data, it will offer the lowest possible amount of money that will make the user provide data, by making his/her utility slightly higher than $U = x(1 - k)$, which is the utility of no data provision. Therefore, Google will offer to the user $p_2 = z$ to buy his/her data, resulting in:

$$U = x(1 - k) - z + z = x(1 - k) > 0, G = y + kx - z > 0.$$

Notice that Google's payment for personal data as a monopsonist $p_2 = z$ is smaller than the amount it pays $p_2 = y$ when it faces competition in the personal data market in regime 2.

For users with $y < z$, the maximum offer Google can make to induce data provision, $\$y$, will not be accepted by the user because it would result in lower user utility than when the user does not provide data:

$$U = x(1 - k) - z + y < (1 - k)x.$$

Therefore, when $y < z$, the user does not provide data and the user's utility and Google benefit are

$$U = CS = x(1 - k), G = kx.$$

The results of the no requirement regime with Google monopsonist are summarized in Table 11.3a.

Table 11.3a: No requirement, default opt-out, personal data provision to Google not required to provide Google search, Google perfectly price discriminating monopsonist in personal data market

		Benefit to user	Benefit to Google
$y > z$	User provides data at price $p = z$	$U = CS = x(1 - k) > 0$	$G = y - z + kx > 0$
$y < z$	When the user values his personal data loss more than Google values the user's data, the user does not sell his/her personal data	$U = CS = x(1 - k) > 0$	$G = xk$

Table 11.3b compares the changes in the user's and Google's benefit across regimes 1 and 3.

Table 11.3b: Comparison of the status quo to opt-out default and Google monopsonist of personal data

Parameter values	Regime	Benefit to user	Benefit to Google	Participation in personal data market, in regimes 1, 3
$x > z$	Default opt-in, requirement, and user accepts	$U = CS = x - z > 0$	$G = y > 0$	Yes, N/A
$z > x$	Default opt-in, requirement, and user rejects	$U = CS = 0$	$G = 0$	No, N/A
$y > z$	Default opt-out, no requirement, user sells info	$U = CS = x(1 - k) > 0$. When $k = 1$, $U = 0$	$G = y - z + xk > kx$. When $k = 1$, $G = y - z + x > x$	N/A, Yes
$y < z$	Default opt-out, no requirement, user does not sell info	$U = CS = x(1 - k) > 0$. When $k = 1$, $U = 0$	$G = xk$. When $k = 1$, $G = x$	N/A, No
$x > z, y > z$	Change of benefit by the removal of the requirement	$\Delta U = z - kx$. When $k = 1$, $\Delta U = z - x < 0$	$\Delta G = -z + xk < 0$. When $k = 1$, $\Delta G = -z + x > 0$	Yes, Yes
$x > z > y$	Change of benefit by the removal of the requirement	$\Delta U = z - kx < 0$. When $k = 1$, $\Delta U = z - x < 0$	$\Delta G = -y + xk$. When $k = 1$, $\Delta G = x - y > 0$.	Yes, No
$y > z > x$	Change of benefit by the removal of the requirement	$\Delta U = x(1 - k)$. When $k = 1$, $\Delta U = 0$.	$\Delta G = y - z + kx$. When $k = 1$, $\Delta G = x - z < 0$.	No, Yes
$z > x, z > y$	Change of benefit by the removal of the requirement	$\Delta U = x(1 - k)$. When $k = 1$, $\Delta U = 0$.	$\Delta G = xk$. When $k = 1$, $\Delta G = x > 0$.	No, No

Table 11.4: Comparison of Google monopsonist in personal data market (regime 3) to Google in competitive personal data market (regime 2)

Parameter values	Regime	Benefit to user	Benefit to Google
$y > z$	Default opt-out, no requirement, user sells info, G monopsonist (regime 3)	$U = CS = x(1 - k) > 0$. When $k = 1$, $U = 0$	$G = y - z + xk > kx$. When $k = 1$, $G = y - z + x > x$
$y > z$	Default opt-out, no requirement, user sells info, personal data market competitive (regime 2)	$U = CS = x + y - z > x > 0$	$G = 0$
$y < z$	Default opt-out, no requirement, user does not sell info, G monopsonist (regime 3)	$U = CS = x(1 - k) > 0$. When $k = 1$, $U = 0$	$G = xk$. When $k = 1$, $G = x$
$y < z$	Default opt-out, no requirement, user does not sell info personal data market competitive (regime 2)	$U = CS = x$	$G = 0$
$y > z$	Change of benefit from 3 to 2 (2 minus 3)	$\Delta U = x + y - z - x(1 - k) = y - z + xk > kx > 0$	$\Delta G = -(y - z + xk) < -xk < 0$
$y < z$	Change of benefit from 3 to 2 (2 minus 3)	$\Delta U = x - x(1 - k) = kx > 0$	$\Delta G = -kx < 0$.

Table 11.4 shows clearly that competition in the personal data market makes users better off and Google worse off in comparison to Google being a monopsonist in the personal data market. This is as expected. It underlines the fact that removing the requirement is not sufficient.

The analysis above shows the need for strict remedies that would restore competition on the marketplace, and therefore going beyond the removal of the requirement.

11.2.2. Natural monopoly or natural oligopoly and market failure in privacy

Contrary to the repeated statements by some,²⁸³⁷ Internet search exhibits network effects because a higher number of search queries improve the quality of search of the particular search engine.²⁸³⁸ Thus, the higher market share of Google in search increases the quality and value to a user of Google's search. This is direct evidence of network ef-

2837 See, H.R. Varian, Use and Abuse of Network Effects (September 17, 2017), available at SSRN: <https://ssrn.com/abstract=3215488> ; C. Tucker, Why Network Effects Matter Less Than They Used To, Harvard Business Review (June 22, 2018), available at <https://hbr.org/2018/06/why-network-effects-matter-less-than-they-used-to> .

2838 This is particularly true for idiosyncratic queries (tail queries). For a discussion, see, I. Graef, EU Competition Law, Data Protection and Online Platforms – Data as Essential Facility (Kluwer, 2016), Section 2.4.2.

fects: higher market share of the service increases the value of the service to the user. Also, when data provision is required for search, the more users you have, the more data you collect, and therefore the company can sell more valuable ads.

Google's requirement of personal data provision to receive Internet search implies that as more people use Google search, Google receives more personal data. So, Google uses its large market share in search in combination with the requirement to increase its market share in data (and enhance its dominant position). As we explained in the previous Section, the requirement increases the ability of Google to refine its categorization of a person, thereby increasing the amount that advertisers are willing to pay. This increases its profitability.

Data collected directly from the individual user, data from the location of the individual, data from Google's virtual assistant Alexa, publicly available data (for example Census data), and data bought from data brokers are combined by Google to refine data sold directly to advertisers and other intermediaries. Google would not have paid for such data had these been not useful and their usefulness is the complementarity they offer in order to make better predictions.

Size and high market share matters for both advertised-based platforms, Google and Facebook. First, we have the direct network effect of adding a user to Google because the addition improves search results for every Google user (and the addition of a Facebook user improves the Facebook experience for all users). Additionally, the requirement of personal data provision to receive Internet service improve the accuracy of data that Google and Facebook sell to advertisers and help increase the market share of each of these companies in the advertising market. So,, the more users you have, the more the users you have in search, the more the advertisers you attract on the other side, and the more valuable it is for the advertisers to use Google on the other side.

Traditionally network effects are defined as pertaining to the demand side of the market, while increasing returns to scale is a term reserved for decreasing unit cost at constant quality in production. Here, the scale of operation and the quality level of the company in the advertising market both increase with the provision of personal data by more users. More users are providing personal data under the requirement aiming to reap the direct network effects in search. The requirement implies that higher scale in consumption of Google's Internet search results in higher quality in the advertising market. The requirement transforms a purely demand-side network effect to a supply-side effect.

With regard to advertisers/data brokers, Google may have monopsony power at the brokers side, in comparison to Microsoft, therefore they can buy the data more cheaply, thus reinforcing their monopsony and monopoly with regard to advertisers

With regard to users, Google is also monopsony for the users even if it does not charge them. As shown earlier, we expect to have higher participation of users selling their data to Google under untying. That could have been positive if that was a traditional monopsony, but this market is not a traditional monopsony because, under tying, Google fixed the market price to zero rather than it being determined as in the traditional mon-

opsony model (endogenous determination). Additionally, under untying, Google offers personalized pricing, again deviating from the traditional monopsony model.

We showed at the previous Section that users are worse off and Google is better off under bundling. Assuming that people can determine rationally if it makes sense to provide their data, a competitive market in the data collection from users, will lead to the users being paid by the digital platforms for the harvesting of their data. Unbundling improves consumer surplus over bundling as the price of data is positive under unbundling since the users get paid for selling their data to the platform and this will also lead to more data being available and collected.

Note that someone that values privacy as a deontological principle (values the idea of privacy) would find problematic that users have the possibility to share their own data, and would be in favour of suppressing data output. In this case a monopsony may not be welfare reducing. There are also issues with regard to the assumption that users are able to rationally determine what is in their long-term interest, as the long-term effects of sharing data may not be easily assessed. They may be inclined to share data, in particular if they receive payment for this, which they may likely regret, had they considered their long term interests. The above could build a behavioural economics critique to the idea that consumers should be paid for their data, and build an argument that monopsony might be efficient, from a social welfare perspective.

An argument could thus be made for nudging users to opt out, rather than to select to receive rewards/positive prices for their data if they cannot determine the long-term costs of sharing their own data. Another option would be to nationalize the dominant digital platform (private monopoly) so as to replace it with a 'public interest' motivated monopsonist, which would limit the harvesting of data to what is absolutely necessary for the improvement of the service to the user (hence, the full consumer surplus would go to the user). However in this case, there may be some costs to innovation. This may be avoided if this state monopolist has the obligation to share data in situations in which this will lead to socially useful innovations by complementary firms, and therefore the social value of information outweighs the social cost of the loss of privacy for the individual user. There is always a risk that determining what is 'socially useful' would be sub-optimal if this is done by a regulator or a state monopolist in view of the discretion offered to the regulator/state monopolist and consequently the risk of capture and inefficiency (this is a classic criticism to administered economy). Hence, some other system of determining what is socially useful may be more preferable. Some authors have put forward quadratic voting as a procedure to overcome the tyranny of the majority (here citizens that are indifferent to the protection of their privacy) and provide proportional weight to people whose interests in a social outcome are stronger (people that greatly value privacy).²⁸³⁹ Quadratic voting is not subject to the criticisms by Arrow to the voting theory of welfare for collective decision-making in order to determine the 'will of the people,' as it does not assume ordinal preferences as Arrow in his impossibility theorem.

2839 E.A. Posner & E.G. Weyl, *Voting Squared: Quadratic Voting in Democratic Politics*, (Coase-Sandor Institute for Law & Economics Working Paper No. 657, 2014).

One may also refer to historical patterns in the industry in order to assess how rising concentration and dominance may have found their source in conduct and business strategies harming privacy, rather than competition on the merits, or may have reinforced the dominant position of the firm by erecting important barriers to entry through the control of important amounts of data. With regard to the social media industry, Srinivasan argues that during the time the social network market was highly competitive, with several hundreds of social networks available to users in 2007, including competing offerings from Google, Yahoo and MySpace, privacy was an important parameter of competition. However, the landscape changed sharply in recent years, predominately because of the business strategy of Facebook.²⁸⁴⁰ Srinivasan narrates how Facebook initially entered the social media market in 2007 putting forward its 'superior' privacy-centered offer, linked to the fact that it was a 'closed communication network' requiring users to join and disclose their information before being able to have access to the network, than existing dominant social networks at the time, such as MySpace. During this more competitive period, Facebook provided users the ability to opt-out of having their information shared with third-parties, including advertisers or marketers and promised them it would remove their information on demand.²⁸⁴¹ Any effort by Facebook to track users' behaviour, through its advertising product Beacon, or subsequently social plugin products, was unsuccessful, as it led to users' backlash and Facebook had to withdraw the product and change its privacy policies, by including a commitment to allow users to vote on future changes that contractually change user privacy.²⁸⁴² However, after a decade of 'false statements' and 'misleading conduct', reneging on previous promises not to track users, Facebook was able to leverage the superior information it has over its users in order to sell more advertising, with the result that the market for digital advertising has been transformed to a duopoly, dominated by Facebook and Google, the two companies accounting for 90-99% of year-over-year growth in the US digital advertising industry.²⁸⁴³

Facebook also secured the cooperation of independent publishers and other businesses participating to its ecosystem requiring all businesses to 'change their own privacy policies to extract from their own users the consent to have Facebook track them for commercial purposes.'²⁸⁴⁴ More importantly, the author claims that Facebook was able to change its privacy policy towards a more active use tracking, after it won against competing social networks, with rivals such as Snapchat and Orkut marginalized or excluded from the market, and consolidated its dominant position on the social media market, in particular during the period after 2014. Hence, privacy-reducing policies were possible only because the users had no other choice of social network to switch to and were thus the direct result of Facebook's dominance on the social media market.

11.2.2. Lock in and Hold up

Research focusing on explaining the reasons that users would switch to a different social network from the one they currently used shows that users do not switch among social media, providers for privacy reasons, but that such decisions are motivated by a number of different factors.²⁸⁴⁵ This research however dates from the period before the change of the dominant business model in social media in 2014 with Facebook moving to systematically monitoring and recording users' activity, as well as the backlash and the increasing awareness of users about issues of privacy and personal data protection. Users may be less open to share information on social media and take increasingly action to monitor their browser data and the information they share.²⁸⁴⁶ Ad blockers have also gained in popularity. However, this has not greatly affected users' switching to more privacy-centred social media, nor has it led to the development of 'pay for privacy' business models, where users will pay for service with money rather than with their data.²⁸⁴⁷ Although not related as such to social media, research also shows that user inertia determined by 'cognitive, affective, and subconscious antecedents' may also play as a mooring factor and affect consumers' switching behaviour.²⁸⁴⁸ Identity network effects may also impact on the decision of users to switch, in particular if most of their friends are participating to the platform they want to switch from, hence creating sunk costs for the user if he decides to switch to a rival social media platform.²⁸⁴⁹ Such path dependency and the switching costs arising out from the buyer side contribute to the development of highly concentrated market structures. Single homing is also quite prevalent, in particular in view of the development of 'path dependent consumption,' with users developing consumption patterns which they are reticent to change, each additional consumption of the same product reinforcing the effect and leading to a quite strong loyalty effect, the user being emotionally or subconsciously locked in a specific product or digital platform, even if the choice is not optimal, in terms of quality or the amount of personal data harvested²⁸⁵⁰.

11.2.3. Information asymmetries and information related failures

Under complete information, the user knows (x) his/her valuation of Facebook's services. But is this really the case? At present, the user does not pay for the access to Facebook. Facebook is a 'free' product in terms of monetary payment. However, the user pays (has a cost) by providing personal data to Facebook for free. This may reduce the user's privacy or may enable the digital platform or whoever else is controlling this data to exploit the user in the future by personalised pricing etc. Hence, there is an issue of transparency of the full costs for the user of the engagement with Facebook. The user just sees the current monetary costs (zero) and does not take into account future costs. Behavioural economic literature on discounting, silver lining effect (the users are attracted by a small gain – zero price to use Facebook – and dissociate that from a large loss – been exploited in the future through perfect price discrimination) may explain why we need to take seriously into account behavioural biases.

Our model also takes into consideration the cost of losing privacy. So, the user is willing to pay \$x for using Facebook, but the take-it-or leave-it contract of Facebook implies that he will lose privacy that he values at \$z. So, the net willingness to pay of a user under the present default opt-in conditions is \$x-z. If the default was opt-out, the user would be willing to pay \$x. In a behavioral setup, the user may underestimate the value of the loss of privacy.

Users do not know how much their data is valued by advertisers/Facebook as they have no access to the information on the value of that data in the context of Facebook's transactions with advertisers and infomediaries at the other side of the platform.

Digital platforms argue that data harvesting and network effects also provide value to the users. However, it is not clear what is the exact value of the network effects from which benefit the users. But even assuming that the data is valuable because of network effects, it is difficult to determine the part of the value that represents the individual contribution brought by the data of the specific user. The user anyway gets better service as his data may enable the platform to provide more relevant queries in some cases and to improve the quality of search for tail queries. The issue is however if the platform collects more data than is needed for improving the service or the quality of the platform: the extra harvesting of data creates 'behavioural surplus' that will itself be highly valued in behavioural futures markets²⁸⁵¹, as explained in Chapter 4.

The lack of competition between networks does not provide information (transparency) about how much the user is valued by digital platforms, such as Facebook, so that the users could have information enabling them to bargain a 'better' deal. This leads to no surplus left for users as it affects the ability of users for collective action against the monopolist, for instance by switching to a rival network. In any case, the choice may be quite limited, in view of the consolidation of the sector, and in particular the dominance of the advertised-based model.

2851 See Chapter 4 and, in more detail, S. Zuboff, *The Age of Surveillance Capitalism* (Public Affairs, 2018).

To this, one may add the social costs of the lack of knowledge by the user of the broader social costs of letting their data being harvested by Facebook or Google: costs to democracy and pluralism, which may be an important concern, also for competition law, in some jurisdictions

11.2.4. Missing markets

The previous examples of market failure assume that there are privacy markets, but these operate inefficiently. One may however argue that the problem is more fundamental to the extent that there are no markets whatsoever. Contrary to the assumptions of the first fundamental theorem of welfare economics, there does not exist a complete set of markets for privacy, data or attention, which are demanded and supplied to be traded at publicly known prices. Actually, data is harvested by search engines for free, as users are not paid any compensation for the data they contribute, with the exception of the free use of the search engine, for which in any case the marginal costs are close to zero. The users cannot also determine what is the value of their data to the digital platform (e.g. Facebook), as they do not have access to the information on transactions between Facebook and advertisers at the other side of the platform. At the same time, the harvesting and use of their personal data may provide to users some benefits if they are offered targeted advertising (which may be positive in case one adheres to the information view of advertising) and a more personalised service. The price that advertisers pay Google or Facebook do not provide any further information as these transactions are not about the users' personal raw data but about inferences made on the basis of their data.

Hence, it appears that the digital economy is characterized by missing markets²⁸⁵², because of the lack of property rights on personal data. Legal regimes may choose to protect entitlements by granting property rights, through a liability rule and regulation, or a combination of the two. If the situation is subject to liability rules, the violation of the specific entitlement to privacy without agreement, should lead to the compensation of the victim for the damages incurred. Property rights provide to their holder the right to legally bar, by injunctive relief, anyone violating his entitlement without his consent. The idea is that the violation of property rule is severely punished with injunctive relief (which is costly), thus deterring the violation of the entitlement at the first place and therefore avoiding future harms. A liability rule is more backwards looking as the aim is to compensate through damages for harm already done. A property rule will always be more favorable toward the injuree (the person whose entitlement is to be violated), and a liability rule will always be more favorable toward the injurer. Property rights also facilitate bargaining.

The allocation of property rights should nevertheless not impose an externality. This may be the case if providing property rights could, for instance, lead some to forego

2852 See, on the problem in general, G.M. Hodgson, How mythical markets mislead analysis: an institutionalist critique of market universalism, (2019) Socio-Economic Review, mwyy049, <https://doi.org/10.1093/ser/mwyy049>.

privacy for instant gratification, with devastating long-term consequences, not only for them personally, but also for society overall. One may for instance envisage the social costs engendered by an entity that has induced users to provide freely, or sell their personal data, in order to manipulate them more easily, because of the reduction of the levels of privacy protection, and thus extract more surplus from users. As mentioned above the lack of property rights and therefore the missing markets issue may not allow parties to negotiate a Pareto efficient transaction. If such social costs are important, there is also an argument for banning such transactions, thus making personal data inalienable. In our view, the level of development of the digital economy does not render this a pragmatic option to follow at this stage.

The lack of a proper regime of property rights on personal data has important implications on the ability of users to protect their interests and capture a part of the surplus value they contribute to. At the same time, digital platforms are able to rely on a quite expansive definition of the domain of intellectual property law and contract law in order to impose almost unilaterally conditions to the users of their products, in practice challenging their autonomy and their freedom to use as they wish their tangible property. The lack of a proper property regime for personal data has enabled digital platforms to harvest this valuable raw material, without any corresponding protection of the interests of the users, by just relying on their consent to their terms and conditions. The possession of this data does not rely on a properly defined property regime (hence the distinction between possession and property rights) but on the control by these digital platforms of important bottlenecks in the way users access the Internet and the various services this may give them access to. The GDPR does not put in place a proper property rights regime for personal data, which would have granted formal rights sanctioned by a public authority, delimited the boundaries of these rights, or establish a system to adjudicate disputes as to the ownership of these rights. Having possession of the item, in the sense of physically controlling it, constitutes just one of the bundle of rights provided by property and ownership, other expressions of the right to property being the ability to use and manage it, the right to receive income from it, the possibility to use it as capital for the production of income, the possibility to use it as security in order to borrow against it. This is still not possible for personal data.

11.3. Exploitative and exclusionary conduct involving privacy-related theories of harm: *ex ante* and *ex post* enforcement

The development of the digital economy leads to an increasing interest of competition authorities for privacy-related theories of harm, both in *ex ante* and *ex post* enforcement. We will explore the various theories put forward and the limits of the existing legal tools to address these new theories of harm.

11.3.1. Ex ante enforcement: data mergers and privacy

It is generally accepted that merger control should take into account the fact that access to personal data may constitute an important source of market power.²⁸⁵³ The recognition of privacy-reducing theories of harm is nonetheless a more complex issue, in particular in view of the *ex ante* nature of merger control and the possibility to address privacy restrictions of competition ex post through the enforcement of data protection laws. The possibility that a merger may be considered anticompetitive because it may lead to a substantial lessening of competition on privacy, or more broadly may have negative consumer welfare effects because of a restriction of the level of privacy in the market, was explored in some recent merger decisions in the EU and the US. As a starting point, we note that both US and EU merger guidelines explicitly recognize non-price factors of competition²⁸⁵⁴. In both jurisdictions such factors may often be considered at the level of market definition, rather than at the later stage of determining theories of harm. However, as a recent OECD report notes, '(t)hese market definition approaches have not been explicitly applied in any merger case to date'²⁸⁵⁵.

We will focus here on the second issue, the first being relatively uncontroversial and not presenting anything specifically different than the traditional approach to mergers²⁸⁵⁶. With regard to privacy concerns, the dominant view is to consider this as a parameter of competition in quality. In this context it can be integrated in the competition assessment under a 'consumer welfare' standard, broadly defined²⁸⁵⁷. However, this approach may be subject to criticism²⁸⁵⁸, and is not the only available option, as we will examine in X.

Starting with the EU, in the *Facebook/WhatsApp* merger, a possible theory of harm explored by the Commission was that 'the merged entity could start collecting data from

2853 See, for instance, M Stucke & A Grunes, *Big Data and Competition Policy* (OUP, 2016), chapters 6–8.

2854 See, for US Guidelines, U.S. Dep't of Justice and the Fed. Tr. Comm'n, *Horizontal Merger Guidelines* §4.0 (2010), available at <https://www.ftc.gov/sites/default/files/attachments/merger-review/100819hmg.pdf> (noting that 'enhanced market power can also be manifested in non-price terms and conditions that adversely affect customers, including reduced product quality, reduced product variety, reduced service, or diminished innovation. Such non-price effects may coexist with price effects, or can arise in their absence' and that '(w)hen the agencies investigate whether a merger may lead to a substantial lessening of non-price competition, they employ an approach analogous to that used to evaluate price competition); for the EU, see .

2855 OECD, *Considering non-price effects in merger control* – Background note by the Secretariat, DAF/COMP(2018)2 ¶112.

2856 See, for instance, the US submission to the OECD's workshop on Non-price effects of mergers, ¶9 (noting that '(e)vidence of the extent of direct competition between the products sold by the merger parties on non-price factors is often the same evidence relied on to determine customer substitution relevant to the hypothetical monopolist test').

2857 For a discussion, see OECD, 'The Role and Measurement of Quality in Competition Analysis' DAF/COMP(2013)17 <<http://www.oecd.org/competition/Quality-in-competition-analysis-2013.pdf>> accessed 21 October 2018. The existence of a trade-off between these various parameters of competition protected by the 'consumer welfare standard' is an open question, in particular as 'the superficial consensus' on consumer welfare 'masks a deep disagreement about what 'consumer welfare' means and especially about what policies best to promote it': G Werden, 'Consumer welfare and competition policy' in J Drexler, W Kerber and R Podszun (eds), *Competition Policy and the Economic Approach: Foundations and Limitations* (Edward Elgar 2011) 15

2858 See, the discussion in OECD, *Considering non-price effects in merger control* – Background note by the Secretariat, DAF/COMP(2018)2 ¶¶ 113–119.

WhatsApp users with a view to improving the accuracy of the targeted ads served on Facebook's social networking platform to WhatsApp users that are also Facebook users'²⁸⁵⁹, thus strengthening Facebook's position in the provision of online advertising services as a result of the increased amount of data which will come under Facebook's control.²⁸⁶⁰ However, the Commission found no concern with regard to the strengthening of Google's position in the online advertising service market, as there was a sufficient number of alternative providers of online advertising services and a significant number of market participants that collected user data alongside Facebook, not least Google. This left, according to the Commission, a large amount of Internet user data that are valuable for advertising purposes outside Facebook's exclusive control.²⁸⁶¹ However, the Commission did not take sufficiently into account the possibility that the data collected by Double/Click, which contained information about a rich sub-set of the web-browsing behaviour of Double/Click users across all publishers' websites engaged in targeted advertising, could facilitate online price discrimination, enhancing the power of the entity to exploit consumers. The Commission accepted DoubleClick's justification that it collected behavioural data from its users for only legitimate purposes, such as improving the overall experience offered to advertisers, and the fact that these were aggregate data that could have been of limited use because of the confidentiality clauses included in the contractual arrangements with both advertisers and publishers and the possibility of Doubleclick's customers to switch to alternative ad serving providers in case Doubleclick violated the confidentiality provisions²⁸⁶². The Commission unconditionally cleared Google's acquisition of DoubleClick finding no competition concerns on any of the relevant advertising-related markets. However, it also recognized that

'it is not excluded that (...) the merged entity would be able to combine DoubleClick's and Google's data collections, e.g., users' IP addresses, cookies IDs, connection times to correctly match records from both databases. Such combination could result in individual users' search histories being linked to the same users' past surfing behaviour on the internet (...) the merged entity may know that the same user has searched for terms A, B and C and visited pages X, Y and Z in the past week. Such information could potentially be used to better target ads to users'²⁸⁶³.

However, the Commission did not focus on the exploitation concerns, dismissing the possibility that the acquisition of WhatsApp by Facebook would enable Facebook to use WhatsApp user data to better target Facebook ads, the Commission doubting on whether Facebook would have the ability and the incentive to engage in such conduct post-transaction. The impact of the merger on privacy was also sidelined. According to the Commission, '(a)ny privacy-related concerns flowing from the increased concentration of data within the control of Facebook as a result of the Transaction do not fall within

2859 Facebook/ WhatsApp (Case No COMP/M.7217) C(2014) 7239 final, para 180.

2860 Ibid., para 184.

2861 Ibid., para 189.

2862 Ibid, para 277.

2863 Ibid, para 360.

the scope of the EU competition law rules but within the scope of the EU data protection rule.²⁸⁶⁴ The Commission focused on the exclusionary/anticompetitive foreclosure related concerns, leaving any possible exploitation concerns, in terms of impact on users' privacy to be dealt by data protection law.

In August 2016, WhatsApp updated its privacy policy to allow for linking WhatsApp users' phone numbers with Facebook users' identity. Hence, the previous statement at the time of the assessment of the merger was proven to have been misleading. Indeed, at the time the merger transaction was assessed, Facebook had offered assurances to the Commission, both in the notification form and in a reply to a request of information, that it would be unable to establish reliable automated matching between Facebook users' accounts and WhatsApp users' accounts. The Commission imposed a €110 million fine on Facebook for providing misleading information about the WhatsApp merger²⁸⁶⁵. It also found that, contrary to Facebook's statements in the 2014 merger review process, the technical possibility of automatically matching Facebook and WhatsApp users' identities already existed in 2014, and that Facebook staff were or should have been aware of such a possibility²⁸⁶⁶. However, this did not affect the Commission's authorisation of the merger as the clearance decision was based on a number of elements going beyond automated user matching.

In *Microsoft/LinkedIn*, the Commission raised two types of concerns relating to data combination.²⁸⁶⁷ One of the theories of harm was that the merged entity could integrate LinkedIn into Microsoft Office and thus combine, to the extent allowed by contract and applicable privacy laws, LinkedIn's and Microsoft's user databases, giving Microsoft's the possibility to shut out its competitors in the customer relationship management market. In particular, Microsoft could deny its competitors access to the full LinkedIn database, and thus prevent them from developing advanced customer relationship management functionalities also through machine learning. The Commission was not however convinced that access to the full LinkedIn database was essential to compete on the market and held that LinkedIn's product was not a 'must have' solution.²⁸⁶⁸

The second theory of harm was more directly concerned with data concentration and its effects on online advertising services. The Commission explored how the regulatory framework in the EU relating to data protection could mitigate some of the competition law concerns:

'(177) As a preliminary remark, it should be noted that any such data combination could only be implemented by the merged entity to the extent it is allowed by applicable data protection rules. In this respect, the Commission notes that, today, Microsoft and LinkedIn are subject to relevant national data protection rules with

2864 Ibid, para 164.

2865 Facebook/WhatsApp, (Case COMP/M.8228), Commission Decision (May 17, 2017), available at http://ec.europa.eu/competition/mergers/cases/decisions/m8228_493_3.pdf.

2866 Ibid, para 86.

2867 Ibid., para 400.

2868 Ibid., para 277.

respect to the collection, processing, storage and usage of personal data, which, subject to certain exceptions, limit their ability to process the dataset they maintain. Currently, the data protection rules of the EU Member State(s) where Microsoft and LinkedIn have their registered seat and/or where they have subsidiaries processing data apply. [...]

(178) Moreover, the Commission notes that the newly adopted General Data Protection Regulation ('GDPR')²⁸⁶⁹ [...] provides for a harmonised and high level of protection of personal data and fully regulates the processing of personal data in the EU, including inter alia the collection, use of, access to and portability of personal data as well as the possibilities to transmit or to transfer personal data. This may further limit Microsoft's ability to have access and to process its users' personal data in the future since the new rules will strengthen the existing rights and empowering individuals with more control over their personal data (i.e. easier access to personal data; right to data portability; etc.).²⁸⁷⁰

In view of the GDPR, the Commission found that it was not likely that LinkedIn data could become in the next two to three years an important input in this market and that in any case, LinkedIn's privacy policy allowed it to share the personal data it collects, processes, stores and uses with third parties.²⁸⁷¹ Again in this merger, the Commission refused to consider exploitation concerns arising out of the higher concentration of data and the combination of LinkedIn and Microsoft's user databases, noting that the merger 'does not raise competition concerns resulting from the possible post-merger combination of the "data" (essentially consisting of personal information, such as information about an individual's job, career history and professional connections, and/or her or his email or other contacts, search behaviour etc. about the users of their services) held by each of the (p)arties in relation to online advertising'²⁸⁷²

Higher concentration of data could nevertheless have a potential impact to competition. The Commission found that the merger could lead to the marginalisation of XING, a competitor of LinkedIn which offered a greater degree of privacy protection to users than LinkedIn (or making the entry of any such competitor more difficult), therefore restricting 'consumer choice in relation to this important parameter of competition.'²⁸⁷³ To address the competition concerns identified by the Commission in the professional social network services market, Microsoft offered a series of commitments, which the Commission found to address the competition concerns identified and therefore conditionally cleared the merger. This case offers the possibility to conceptualise privacy as a parameter of competition that may eventually be subject to measurement²⁸⁷⁴.

2869 General Data Protection Regulation (EU) 2016/679 the protection of natural persons with regard to the processing of personal data and on the free movement of such data [2016] OJ L 119/1.

2870 Ibid., paras 177–178.

2871 Ibid., para 255.

2872 Ibid., para 176.

2873 Ibid., para 350. Indeed, the Commission had found that privacy was an important parameter of competition and driver of customer choice in the market for professional social networking services.

2874 K Bania, 'The role of consumer data in the enforcement of EU competition law' 2018 (January) European Competition

Privacy related theories of harm were also discussed in the recent merger between Apple and Shazam involved two companies providing complementary services (software solutions platforms and digital music streaming services for Apple and music recognition apps for Shazam)²⁸⁷⁵. The Commission explored if the fact that Shazam currently collects certain data on users of third party's apps, and in particular digital music streaming apps, installed on the same smart mobile devices where the Shazam app is installed (for both Android and iOS devices) and allows those of its users who are also users of Spotify to connect their Shazam account (anonymous or registered) to their Spotify account (freemium or premium), therefore enabling the Shazam app to identify its users, for example, the email address or Facebook identifier for registered Shazam users and the advertising identifier for anonymous Shazam users²⁸⁷⁶ could have 'a negative impact on competition'²⁸⁷⁷. In assessing this element, the Commission took into account 'certain legal and/or contractual limitations on the use of this customer information' by Apple post-merger²⁸⁷⁸. Without entering into an in-depth assessment, from the perspective of data protection law (GDPR), the Commission proceeded to an abridged analysis of Shazam's terms of service and privacy Notice to conclude that the purpose of this harvesting of personal data has been specified and made manifest to Shazam's users. The Commission also referred to the EU rules dealing with privacy and the protection of the confidentiality of communications, in particular the e-Privacy Directive, which may also affect the transmission of the customer information and its subsequent use²⁸⁷⁹. However, the Commission noted that the e-Privacy Directive does not prevent any technical storage or access for the sole purpose of carrying out the transmission of a communication over an electronic communications network, thus enabling Apple to lawfully store or have access to this customer information. Possible contractual limitations to the use of this data could emanate from the Android Developer Guidelines, which so far had provided Shazam access to data about which apps are installed on a user's Android device, or by rivals to the new entity, such as Spotify, which, according

2875 Commission Decision, M.8788 – Apple / Shazam (November 11th, 2018), available at http://ec.europa.eu/competition/mergers/cases/decisions/m8788_1279_3.pdf.

2876 Ibid., para 199

2877 Ibid., para 219.

2878 Ibid., para 225. The Commission indeed refers to Article 5(1)(b) of the GDPR as indicating that 'personal data which has been collected for specified, explicit and legitimate purposes may not be further processed in a manner that is incompatible with those purposes' and that '(d)ata which qualifies as personal data under the GDPR can be processed by a third party only to the extent that there exists a contractual legal basis for the transmission to the third party and a legal basis for the processing by that third party.' Ibid., para 229.

2879 Ibid., paras 233-234. Directive 2002/58/EC of the European Parliament and of the Council of 12 July 2002 concerning the processing of personal data and the protection of privacy in the electronic communications sector (e-Privacy Directive), [2002] OJ L 201/37, which, in Article 5(3), provides inter alia that Member States should ensure that the storing of information or gaining access to information already stored in the terminal equipment of a subscriber or user is only allowed on condition that the subscriber or user concerned has given his or her consent following clear and comprehensive information about the nature of data processing.

to their developer terms and conditions of service, may restrict the use of Spotify's user data by app developers and enforce it if, post-merger, Apple would aim to collect data for services that compete with those provided by Spotify²⁸⁸⁰. Notwithstanding these limitations, the Commission found that the new entity could collect this customer information lawfully and proceeded to the analysis of the incentive and ability of the new entity to use this customer information to put competitors at a competitive disadvantage²⁸⁸¹.

In the US, harm to privacy did not come up in the context of assessing merger activity, any issues being dealt with through Section 5 of the FTC Act condemning unfair or deceptive acts or practices in or affecting commerce.

11.3.2. Ex post enforcement: abuse of a dominant position or economic dependence

Restrictions on privacy may also be subject to *ex post* enforcement, in particular, but not exclusively the prohibition of an abuse of a dominant position²⁸⁸². We explore different theories of harm that may give rise to competition law concerns and suggest specific tests for their assessment.

11.3.2.1. Excessive data extraction

'Excessive' data extra may constitute a competition law concern for some competition law regimes to the same extent that excessive prices have been targeted by some competition authorities.

It is worth noting that excessive pricing as a competition law issue has been a quite controversial topic, with certain jurisdictions, in particular the US rejecting the possibility to bring an excessive pricing case when this may only be motivated by concerns about exploitation, rather than by concerns about collusion. Despite the recent extension of

2880 Ibid., para 237.

2881 Ibid., para. 238.

2882 It is also possible for agreements that restrict competition on privacy to also fall under the prohibition of anticompetitive collusive practices, to the extent that such an agreement will reduce competition on a parameter of competition, quality, which in some markets may be a quite significant factor of the competitive game. This is well accepted now for agreements restricting innovation, and it should be the same for agreements restricting privacy. To the extent that an agreement to restrict competition on privacy may not have any redeeming virtue, although its effect is certainly to reduce consumer welfare as, at least, it affects competition on quality, it is not unimaginable that a competition authority qualifies it as a restriction of competition by its nature, without any need to assess its anticompetitive effects in great detail. It remains, however, an open question if agreements of this sort between undertakings with relatively low market shares, or in a non-concentrated market, may be a cause of concern justifying the (rebuttable) presumption of anticompetitive effect that would result a qualification of such agreements or concerted practices as a restriction of competition by object. The approach currently followed by the EU courts in defining restrictions of competition by object, accepts that 'the real conditions of the functioning and the structure of the market or markets in question' may be elements to take into account in assessing restrictions of competition by object: see, most recently, Case C-179/16, F. Hoffmann-La Roche Ltd and Others v Autorità Garante della Concorrenza e del Mercato, ECLI:EU:C:2018:25, paras 79-80.

the scope of Section 5 FTC Act to some forms of hybrid excessive/exploitative practices in the context of Standard Setting Organizations (SSOs) or related to SEP royalties, in the presence of a previous commitment of the dominant firm to license essential proprietary technology on RAND terms²⁸⁸³ or in breach of the duty of good faith of a member of an SSO with regard to the standardisation process²⁸⁸⁴, US antitrust law does not apply to purely exploitative practices. Although this had always been the case,²⁸⁸⁵ it has been made clearer in *Verizon v Trinko*, the Supreme Court noting that “(t)he mere possession of monopoly power, and the concomitant charging of monopoly prices, is not only not unlawful; it is an important element of the free-market system. The opportunity to charge monopoly prices – at least for a short period – is what attracts “business acumen” in the first place; it induces risk taking that produces innovation and economic growth.”²⁸⁸⁶

However, in the EU, and several other jurisdictions excessive pricing forms a well-accepted cause of action in competition law. In the EU, excessive prices may be found to infringe Article 102(a) TFEU which may apply to purely exploitative conduct (exploiting consumers directly without any requirement to prove any exclusionary conduct), in particular conduct that is ‘directly or indirectly imposing unfair purchase or selling prices or other unfair trading conditions.’

One may argue that similar principles could apply to an ‘excessive’ extraction of data. However, as Haucap explains ‘data is not like money’, as it ‘does not reduce the user’s ability to provide the same data to another service or multiple other services’; this is ‘a fundamental difference to excessive pricing cases where customers are left with less money/wealth once they have been exploited.’²⁸⁸⁷ As the German competition authority (Bundeskartellamt – BKA) has noted in its recent Facebook decision, ‘(p)ersonal data represent an unlimited commodity that is not used up by sharing and even consumers on a limited budget do not need to determine how much they are willing to pay.’²⁸⁸⁸

This analysis nevertheless ignores the impact data extraction may have on the reduction of privacy, not only because of the violation of the fundamental right of privacy but also from a purely user surplus perspective, to the extent that it enables the platform to predict the preference map and consequently the behaviour of the user. This provides the platform a structurally more powerful position in its future interactions with the us

ers and the ability to reduce consumer surplus (not only in terms of not satisfying the privacy preferences of users, but also in reinforcing the platform's capacity to impose different price discrimination strategies against them)²⁸⁸⁹. As the BKA also explains in its decision, 'the main problem' in the excessive extraction of data cases is that 'when consumers share their personal data, they are not really able to judge which and how many data are being collected by which company, to whom their data is being transmitted and what the implications of giving consent to data processing are.'²⁸⁹⁰ Users may be unaware that the extracted data is likely to facilitate their exploitation. The issue here will therefore be to decide if a prophylactic intervention focusing on excessive data extraction so as to avoid future instances of exploitation (eventually through different forms of personalised pricing and price discrimination) may be the preferable option, rather than addressing each of these instances of exploitation through the application of the relevant prohibitions on price discrimination or other forms of exploitative practices at a later stage. However, note that this will require also some re-conceptualisation of price discrimination in competition law, which is not usually prohibited as such.²⁸⁹¹

Alternatively, privacy may be considered as a personal good valued by the consumer, and therefore any privacy reduction may be tantamount to a form of consumer harm (reduction of quality). One may argue that if this is the case, the fact that the user does not switch platform, notwithstanding the 'excessive' extraction of data, signals that, either this extraction is not considered 'excessive' enough by the user, or that he values the services provided by the platform more than the inconvenience of reduced privacy, to the extent that the exchange is voluntary and from this exchange and the 'price' in terms of privacy reduction the user is ready to pay reveal his real preferences about the trade off. This assumes that the user is fully informed about the reduction of his privacy and that he is rationally proceeding to a trade off between the costs and benefits of using the platform. However, although early studies found that individuals will perform a 'privacy calculus' before disclosing information necessary to complete an e-commerce transaction, more recent work has shown that there is some cognitive dissonance between consumers' online behaviour (their revealed preferences) and their stated preferences for privacy, leading to the so called 'privacy paradox.'²⁸⁹² Users may value privacy, but do nothing to protect it.²⁸⁹³ Recent research also highlights the bounded rationality of consumers when performing this privacy calculus – in other words, consumers lack

the bandwidth to compare the costs and benefits of sharing personal information.²⁸⁹⁴ The 'privacy paradox' is indeed a complex phenomenon the apparent discrepancy of people's concerns over their privacy and their online behaviours, such as bounded rationality, cognitive biases and heuristics, or social factors²⁸⁹⁵. Further, despite privacy notices, individuals may not always be aware of the data harvesting to which their personal information is subject as they rarely, if ever, read websites' Terms and Conditions (T&Cs) of service due to length, legalistic language and a 'take it or leave it' approach.²⁸⁹⁶ For want of any better alternative, 'tick, click and hope for the best' sums up most consumers' attitude. Through IoT users may in the future allow smart devices to engage in online transactions on their behalf based on learned preferences. A more systematic use of digital assistants might require default or adapted consent mechanisms.²⁸⁹⁷ Conversely, tech advances could lead to better results for consumers if, for example, artificial intelligence formed by learned consumer patterns was used to form buyer coalitions to seek better terms.²⁸⁹⁸

The main difficulty with the excessive data extraction claim is to determine what constitutes 'excessive' and therefore exploitative. In a traditional excessive pricing claim, the level of prices in a competitive market (on the basis of an estimation of the level of prices from a workable competition perspective) usually serves as the counterfactual. This of course depends on the 'economic value' of the product, as this is determined either by using a cost+ approach, that is adding up the different costs of the product, or by comparing the price with a comparable competitive market, which should be the preferred method in the context of an intangible economy. In the case of excessive data extraction, the counterfactual may more easily be established as the level of privacy enjoyed by the user in the absence of the specific conduct that is assessed as excessive. But one can also imagine a more abstract counterfactual which may broadly serve as the standard to determine the 'excessive' nature of the data extraction. This will relate to the purpose of the data extraction and how this affects the user's experience and therefore the 'quality' of the service provided. One may argue that the data extraction by

2894 Acquisti et al (2013 and 2016) suggest that consumers often prefer short term discounts over long term risk of disclosing personal information. John, L. K., & Loewenstein, G. (2013). 2898 Some have coined the term 'algorithmic consumer' to convey the complexity of the decision process in the digital era of the Internet of Things ('IoT'): M. Gal and N. Elkin-Koren, "Algorithmic Consumers" (August 8, 2016). *Harvard Journal of Law and Technology*, Vol. 30, 2017. Available at SSRN: <https://ssrn.com/abstract=2876201>.

the platform should not be considered 'excessive' if the data is used, either to improve the product in order to respond to the needs of the specific user, if personalisation is welfare-enhancing, or in case the platform is employing an advertised-based model to better match advertisers and consumers, which improves the situation of the user in comparison to what would have been the case had the user receive advertising of little interest to him. Consumers may indeed prefer to receive advertising that matches their preferences and could inform them about the products they are interested in, rather than 'junk' advertising.

Haucap observes that the data extraction may be considered excessive in the presence of these two scenarios 'once we assume that '(a) either a sufficient number of consumers do actually receive disutility from 'excessive' data requirements and from having their data combined or (b) consumers are somehow being harmed without noticing it'²⁸⁹⁹. Certainly, this is behaviour that may fall under data protection or consumer protection rules, but as discussed in II.A. the problem is exacerbated in case the platform has market or bargaining power and thus the consumer may not easily switch to an option that is more respectful of his privacy.

This debate raises the question of 'whether antitrust law should hold dominant firms to stricter data protection and privacy standards than competing firms without market power'²⁹⁰⁰. Indeed, excessive data extraction will be an issue for competition law only in situations in which the platform disposes a dominant position or monopoly power or there is a collective dominant position. Smaller size platforms may thus be able to adopt practices of data extraction that could be considered as excessive. Some authors raise questions as to the legitimacy of such 'differential treatment' and the higher duties imposed on dominant undertakings. We consider that these arguments do not stand serious scrutiny. First, only dominant undertakings are also targeted by provisions against excessive pricing, other undertakings being free to decide their pricing strategies. If this is not considered a problem for excessive pricing claims, it should not also be an issue for excessive data extraction claims. Second, as previously discussed a concentrated market constitutes a less optimal, from a privacy perspective, market structure than a less concentrated market, as there is a higher likelihood that the market tips to less-privacy centred business models, in particular in view of the higher valuation of advertised-based platforms by financial markets. Thirdly, it is in fact the preeminent position of the platform in its core activity and in adjacent markets that enables it to impose to its users a business model reducing their privacy, as the users cannot easily switch or do not generally switch to alternative platforms that would offer higher levels of privacy protection. Finally, non-dominant platforms are subject to data protection laws, which impose specific duties to all undertakings (and data controllers) irrespective of market size to protect the privacy of their users. However, as explained in Chapter 5 there is added value in competition law intervention.

2899 J. Haucap, Data Protection and Antitrust: New Types of Abuse Cases? An Economist's view in light of the German Facebook Decision, CPI Antitrust Chronicle (February 2019), 3.

2900 Ibid., 4.

It is likely that excessive data extraction may constitute a form of exploitative behaviour. There has been some discussion over targeting purely exploitative behaviour through the abuse of dominant position provisions. Commentators have expressed a number of reservations on this issue with regard to claims of excessive pricing, and it is important to explore if the same objections may also apply in the event of a privacy related harm:

(i) It is often acknowledged that determining excessive pricing may be hard, in particular determining the right benchmark. Would the perfect competitive price constitute such a benchmark? But what would that mean in the context of a market characterized by network effects? Can one assume that the but-for scenario would have been the development of a duopoly, or should we use models of imperfect competition? How can it be calculated? If one allows some margin above competitive price, what is the magnitude of this margin? How to establish reasonable return on investment?

(ii) Setting clear rules for compliance in dynamic markets is even harder; How should these rules apply in dynamic markets, where there is upfront investment for the future? Should one require high *ex post* margins to incentivise *ex ante* risky investments (e.g. in R&D)? It is important to acknowledge that high margins on some activities may be required to cover fixed costs that are common across activities;

(iii) Remedies for excessive pricing can equate to price regulation (either implicitly or explicitly);

(iv) Price regulation can be distortive to competition, investment and R&D; Price regulation can inhibit entry/expansion by competitors, can distort investment incentives, can distort incentives for marketing and R&D – i.e. ‘portfolio pricing’ approach (in view of the fact that the majority of R&D projects fail), may distort pricing incentives; Proponents of this view suggest that there may need to be explicit regulation for certain areas of natural monopoly – such as utilities – but this should be done carefully by sector-specific regulators. The rest of the economy should be left alone – since the risks of careless and ill-informed intervention outweigh any potential benefits;

(v) The problem will typically solve itself, since high profits encourage entry.

(vi) Defining what constitutes an excessive price is too complicated for competition authorities or the courts, which are not the adequate institutions for this task.

In view of these difficulties, commentators have suggested a number of limiting principles to the application of abuse of dominance provisions to purely exploitative practices, that should apply only in narrow circumstances, such as that there are very high and long lasting barriers to entry (and expansion); and the firms (near) monopoly position has not been the result of past innovation or investment²⁹⁰¹.

2901 See, D.S. Evans and J.A. Padilla, ‘Excessive Prices: Using Economics to Define Administrable Legal Rules’ [2005] 1 Journal of Competition Law & Economics 97; L.H. Röller, ‘Exploitative Abuses’ in C.D. Ehlermann and M. Marquis (eds) European

However, from the above considerations, very few apply in the situation of excessive data extraction.

First, although not all degrees of data extraction may be considered problematic, to the extent that data extraction may also occur in situations of perfect competition, data extraction that contravenes to the data protection regulation, should this exist, can be presumed to be of an excessive level. From then on it is a matter of a case-by-case analysis of the specific conditions of the market in order to determine if the dominant position and the data policies adopted by the dominant platform contributed to the lower level of data protection and privacy, in comparison to the situation in the market before such dominant position emerged and the data policies altered. This case-by-case analysis of the conditions of the market and the business strategies of the firms is commonplace in competition law analysis.

Second, the risk of data extraction strategies is that once tried they may generate superior profitability for the platforms that manage to harvest most of the personal data and hence could lead to increasing returns to scale and learning-by-doing that may be highly valued by financial markets. There is therefore a risk that the mode of competition and innovation in the industry will get stuck to an equilibrium that would be suboptimal from a data protection perspective. The difficulties mentioned above regarding fixed costs are not also that relevant in this context, in view of the multi-sided markets context of the business strategies followed, the non-price harm to consumers in this case in terms of reduced privacy being on a different market than the price effect, which is in the advertising market(s).

Third, the remedies for excessive data extraction may be straightforward and a cease and desist order would be in most cases sufficient to deal with the harm. Hence, there is no need for price regulation. Of course, if the remedy involves the requirement to offer users to pay for a more compatible to privacy option, determining the 'price' of privacy might require some form of price regulation. We explore the way this can be done in the last Section.

Fourth, any remedies aiming to promote data protection and privacy for users will most likely not distort competition, innovation and R&D. On the contrary, that may enable a differentiation of the business models followed by the platforms and nudge the direction of innovation efforts to models promoting privacy.

Fifth, it is not clear if the problem may solve itself, as once a market has tipped to a sub-optimal equilibrium in terms of privacy, for instance if platforms based on the advertised-based model harvesting personal data dominate the market, we have seen that it is quite difficult for any platform to challenge this position, even if it offers a more privacy-enhancing alternative, in view of the network effects. Hence, some form of state intervention is needed. Sixth, determining if a platform has proceeded to an excessive extraction of data, including committing a violation of data protection law is certainly a

much easier task for the courts than determining if a price is 'excessive', the latter involving some sophisticated economic analysis.

One could also challenge the argument over the risks that such claims set for legal certainty, requiring the development of narrow limiting principles. Contrary to the situation of price related exploitation, courts and competition authorities can more easily set clear principles on the basis of existing rules of data protection law, or in case they do not exist on the basis of the hypothetical revealed preferences of consumers, either determined through 'willingness to pay' (WTP) surveys, or because consumers usually value less privacy if they are asked how much they are ready to pay for it, instead of how much they would like to be paid in order to lose it (Willingness to Accept, WTA), through other methods (e.g. hedonic pricing)²⁹⁰².

We will briefly explore the constitutive elements of an excessive harvesting of data case as a competition law violation in order to see how the existing case law regarding excessive prices may apply in this context. The focus will be on the EU as it is the jurisdiction that serves as a reference for other jurisdictions, including some BRICS, that also sanction excessive pricing²⁹⁰³.

2902 A. Acquisti, J. K. Leslie & G. Loewenstein, What Is Privacy Worth?, (2013) 42(2) *The Journal of Legal Studies* 249, 268 (noting that 'individuals' preferences for privacy may not be as stable or as internally consistent as the standard economic perspective assumes' and finding that there is a 'gap between privacy WTP and WTA' and arguing 'against the uncritical use of privacy valuations that have used single methods—for example, only WTP or only WTA').

2903 In Brazil, despite the reference in Law 12.529/2011, art 36, III to conducts which arbitrarily increase profits, a pure case of excessive pricing will not succeed. A possible effect in welfare is generally part of the antitrust analysis. Therefore, a case based on exploitative abuse of prices is unlikely.

In Russia, to date, there are no relevant digital competition cases dealing with excessive pricing. The only applicable case is the case against the four main telecom operators (MTS, Vimpelcom and Megafon) that were found to have breached Article 10 (1) (1) of the Federal Law on Protection of Competition (setting and maintenance of monopolistically high prices). FAS of Russia said that the revenues these companies received by increasing their roaming tariffs were higher "than the amount of costs and profit necessary for efficient execution of inter-operator roaming agreements". No other (digital) cases from Russia dealt with excessive pricing.

In India, if a dominant firm "directly or indirectly imposes unfair or discriminatory price in purchase or sale (including predatory price) of goods or services", it will amount to an abuse of dominance (section 4(2) (a) (ii)). Any possibility of excessive or unfairly low prices is covered under this provision.

Recognizing difficulties in determining whether a price is excessive, the Commission in HT Media case [In re M/s HT Media Limited & M/s Super Cassettes Industries Limited, Case No. 40/2011, available at https://www.cci.gov.in/sites/default/files/C-2011-40_0.pdf] observed that 'in the absence of the cost data it will be difficult, neigh impossible, to term the price charged by the opposite party at ... as unfair being excessive solely on the basis that it is higher than the price charged by the competitors of the opposite party'.

As a recent note by the CCI to the OECD acknowledges, "(g)iven the challenges associated with assessment of benchmark 'fair price', followed by regulatory dilemma of associated trade-offs between static and dynamic efficiency, the Commission has rarely intervened in cases exclusively involving excessive pricing as the primary allegation. Even in cases where intervention has been made, the Commission has been averse to devising any pricing remedies": Excessive Pricing in Pharmaceutical Markets – Note by India, OECD, 2018; DAF/COMP/WD(2018)113.

In China, excessive pricing is prohibited under Article 17(1) of the Anti-Monopoly Law. The legal test is similar to that put forward in United Brands. The conduct is assessed according the following test: (i) whether the dominant business operator sells products at high prices or buys products at low prices; (ii) whether the price is unfair. In assessing the

The legal test for excessive pricing in the EU results from the seminal *United Brands* case, where the Court of Justice (CJEU) held that a price may be found excessive if it has no reasonable relation to the economic value of the product supplied.²⁹⁰⁴ According to the Court, this excess could, *inter alia*, be determined objectively if it were possible for it to be calculated by making a comparison between the selling price of the product in question and its cost of production, which would disclose the amount of the profit margin²⁹⁰⁵. A two- step analysis is carried out: it has to be determined ‘whether the difference between the costs actually incurred and the price actually charged is excessive, and, if the answer to this question is in the affirmative, whether a price has been imposed which is either unfair in itself or when compared to competing products.’²⁹⁰⁶ These two conditions (steps) are cumulative. Evidence of an excessive profit margin is not sufficient in itself to prove an abuse. The EU competition authorities employ a cost– price approach in order to determine the excessive character of a profit margin. With regard to the measurement of the ‘excessive’ nature of the prices, a possible option is to determine an adequate cost measure to measure profit (adopt a cost-plus approach), compare that to the price and then to assess the excessiveness of the profit margin, the last operation involving the definition of some benchmarks. Some profit margin would also be entirely justified in dynamic industries or industries with network effects.

As to the adequate benchmark prices that would define the ‘unfair’ character of the prices charged, a comparison with the prices charged by competitors might be a possible option (although one should be cautious, as price differences may indicate quality differences). In *United Brands* the Court noted that ‘other ways may be devised— and eco-

unfairness, the following factors shall be taken into consideration: (i) comparison with other same or similar products or services; (ii) comparison with other geographic markets; (iii) comparison with historical prices: Article 14 of the Interim Provisions on Prohibiting Abuse of Dominant Market Positions.

In South Africa, the regime for excessive pricing adapted the test of EU Competition Law in *United Brands*. However following the decision of the Competition Appeal Court in *Sasol Chemical Industries Ltd v The Competition Commission* 2015(5)SA471(CAC) where the Commission failed to prove its case based upon the *United Brands* type test the law was amended in 2018. While it remains a case of abuse of dominance for a dominant firm to charge an excessive price for a good or service, the amendment has changed the test as is shown by way of the following change to s8 of the Act: If there is a prima facie case of abuse of dominance because the dominant firm charged an excessive price, the dominant firm must show that the price was reasonable.

‘Any person determining whether a price is an excessive price must determine if that price is higher than a competitive price and whether such difference is unreasonable, determined by taking into account all relevant factors, which may include—(a)the respondent’s price-cost margin, internal rate of return, return on capital invested or profit history;(b)the respondent’s prices for the goods or services—(i) in markets in which there are competing products;(ii) to customers in other geographic markets;(iii) for similar products in other markets; and(iv) historically;(c)relevant comparator firm’s prices and level of profits for the goods or services in a competitive market for those goods or services;(d)the length of time the prices have been charged at that level;(e)the structural characteristics of the relevant market, including the extent of the respondent’s market share, the degree of contestability of the market, barriers to entry and past or current advantage that is not due to the respondent’s own commercial efficiency or investment, such as direct or indirect state support for a firm or firms in the market’

economic theorists have not failed to think up several— of selecting the rules for determining whether the price of a product is unfair.²⁹⁰⁷ Other options include the comparison with the price of the product over different geographic markets.²⁹⁰⁸ Hence, according to EU competition law, a price can be unlawfully excessive where ‘it ha[d] no reasonable relation to the economic value of the product supplied’ and assessed the prices using the following test: (1) whether the difference between the costs and the price was excessive (‘excessiveness limb’); and (2) whether the price was either unfair (a) in itself or (b) when compared to the price of competing products (‘unfairness limb’)²⁹⁰⁹. From an economic perspective, excessive extraction should be of concern only if it results from some form of market failure, such as lack of competition or other barriers that make it difficult for consumers to switch to competitors that would extract less data. However, the concept of fairness used provides some leeway to the enforcer to determine broader standards.

Applying this test to the issue of excessive data extraction, Robertson argues that ‘one may in a first step need to look at the amount of personalized data gathered through third-party tracking (the price paid by the user), and what the user receives in return (the product’s cost to the service provider and its economic value)’, thus assessing ‘whether there is a reasonable relation between the amount of data collection that the tracker can or will carry out and the economic value of the digital service the users receive’²⁹¹⁰.

It is important in this context to determine, as a first step, the ‘economic value’ of the product, that is, the objective value that consumers would apply to the specific product in the counterfactual of a ‘normal and sufficiently effective’ competitive market (the benchmark price) and then determine if the difference between the price and cost in the factual compared to the counterfactual is excessive, the evaluation of costs most often deriving from a cost plus formula. This will involve the determination of which costs are relevant for pricing. Barriers to entry, such as network effects, may also be considered in the overall assessment of the likelihood that the levels of data extraction may be, or not, at a competitive level, thus determining the nature of the counterfactual.

Economic value cannot be determined in a similar way as in the context of the tangible economy, that is, simply on the basis of the various components of production costs (fixed, variable and sunk) plus a reasonable return on the costs the undertaking incurred with respect of the relevant product.²⁹¹¹ It is also important to compare with

2911 Other ways to determine this value relate to a comparison with other, more competitive markets, where no such conduct took place.

the level of extraction of data practised by platforms in more competitive markets, or the same platform over time, or across different customer segments, on a 'consistent basis' and employing 'objective, appropriate and verifiable criteria.'²⁹¹² In any case an overall assessment should each time be required.

With regard to the cost-plus approach, as the digital service provided relates to the entertainment/content or convenience to the user (e.g. social media, the search engine), the cost should be related to the production of such services or convenience. However, as we have examined in Chapter 5 a lot of the 'free' content available on some digital platforms is mainly produced and uploaded by the users themselves. The users also contribute to the attractiveness of the search engine by providing their data and thus enabling a better training for the platform's algorithms, thus enhancing its analytic skills through learning-by-doing. Hence, the first step of the analysis should involve some form of evaluation of the operational costs of the platforms linked to the provision of the digital service, and eventually any costs involved in the creation of content for some platforms, such as production costs (e.g. Netflix), payment to content contributors (e.g. You Tube) etc. Platforms may also argue that the data harvesting enables them to offer users targeted advertising, which should be considered as welfare-enhancing and thus forming part of the 'digital service' offered by the platform, as it constitutes an improvement in terms of time saved and search costs in comparison to the situation of across-the board advertising.²⁹¹³ However, the welfare effects of targeted advertising are ambiguous and largely depend on the specific types of personal information made available through the targeting process.²⁹¹⁴ The allocation of the benefits between the advertisers, the intermediary and consumers also varies and requires a case-by-case assessment. If targeted advertising constitutes adds a welfare gain to the user, then any cost involved in the provision of such digital service (for instance marketing costs) should form part of the assessment of the value of the economic value. In any case the simple fact that an undertaking earns above normal returns by harvesting more data does not prove the excessiveness of the data extraction.

As a second step in the analysis, one may determine if the price paid by the consumer has 'no reasonable relationship' with the value of the product. This looks to non-cost related factors, eventually also related to the demand side, such as network effects. As the (aggregate) demand curve indicates the maximum amount that potential customers would be willing to pay for each unit of a good, one may derive the customers' marginal economic valuations for each unit. One of the issues that may come up in the context of excessive data extraction cases is that the 'price' paid by the users takes the form either of data, which they agree to divulge to the platform and to third party trackers sometimes without knowing the real extent, or their attention/time. Users may also pay

a 'price' to get access to the service. There are various models of monetisation of digital platforms, such as providing access for free while milking the 'money market', through subscriptions, offering a free and paid (premium) version (freemium), or an add-supported freemium.

Then comes the second step, which is to determine the unfair character of the amount of data harvested, either 'in itself or when compared to competing products.' As the UK CAT held in *Pfizer & Flynn Pharma*, excessiveness should not be assessed by reference to the theoretical concept of 'idealized or perfect competition' but the 'real world (where normal, effective competition is the most that should be expected).'²⁹¹⁵ Unfairness should also rely on a comparison with the level of data extraction in other comparable markets, and assess of the differential between economic value and 'price' is 'sufficiently significant and persistent to be excessive', as well as the evolution of this extraction of data over time, of course giving appropriate consideration to any objective justification advanced by the dominant undertaking.²⁹¹⁶

11.3.2.2. Personalised pricing

The practice of *behavioural pricing* or *personalised price discrimination*, which comes tantamount to first degree price discrimination (or person-specific pricing), is now possible in view of Big Data and algorithmic pricing as practiced in online commerce, as sellers charge different prices depending upon a buyers' search history, or "digital shadow"²⁹¹⁷. Firms may actively manipulate the choice of consumers.²⁹¹⁸ Recent calls for intervention against "behavioural pricing" (or personalised price discrimination),²⁹¹⁹ which may be

2919 See, *Autorité de la Concurrence & Bundeskartellamt, Competition Law and Big Data* (May 10th, 2016), 21-22, noting that although the application of EU competition law to these practices may be debated, in Germany, the Federal Supreme Court found that the national provision against the abuse of a dominant position can include a consumer protection dimension as regards price discrimination, see German Federal Supreme Court (BGH), „Entega II“, KZR 5/10, judgment of 07.12.2010. For a discussion of "personalised pricing" see, P Coen & N Timan, 'The Economics of Online Personalised Pricing' (Office of Fair Trading 2013); Oxera, 'Behavioural Economics and Its Impact on Competition Policy' (Oxera 2013) ; T.J. Richards et al, *Personalized Pricing and Price Fairness*, (2015), available at https://courses.cit.cornell.edu/jl2545/papers/personalized_Pricing_IJIO.pdf ; A Ezrachi & M Stucke, 'The Rise of Behavioural Discrimination' [2016] 37 *ECLR* 484; A Ezrachi & M Stucke, *Virtual Competition* (Harvard University Press 2016), Chapter 11 (distinguishing "near perfect" discrimination, involving the categorisation of consumers through the harvesting of personal information collected with the help of Big Data and self-learning algorithms, from "behavioural" discrimination, which is led with the aim to trigger consumer biases and increase consumption); M Bourreau et al., *Big Data and Competition Policy: Market Power, personalised pricing and advertising*, CERRE Project Report (February 2017).

considered as a form of algorithmic discrimination, illustrate the broader societal concerns (if not only economic) that are raised with regard to the perceived manipulation of consumers by companies, something as old as advertising exists.²⁹²⁰ In the era of “machine learning” and artificial intelligence-assisted pricing the risks of “digital” consumer manipulation may admittedly increase at an industrial scale.²⁹²¹ Digital markets exacerbate the above risks, in view of the possibilities they offer of “a vast psychological audit, discovering and representing the desires of society”²⁹²² and of each individual separately, offering sophisticated evaluation methods that are closely linked to the direct observation of consumer preferences, but also more broadly of a whole range of preferences expressed in social, and private life, through the means of sociometric analysis²⁹²³. Big data enable us to observe, allegedly more accurately, the inner mental states of people and potentially influence the way these form their core preferences. Such manipulative potential and of course the possibility that this may occur at a larger scale, in view of the possibilities offered by algorithms, data analysis and artificial intelligence, is clearly motivating public authorities to action.

This may later feed in the companies’ commercial strategies that may, for instance, develop personalised pricing strategies, which may be considered a form of price discrimination. Price discrimination may be of different types:

- *First degree price discrimination*: it enables the producer to set individualized prices for each customer, relying on its knowledge of *individual* preferences
- *Second degree price discrimination*: The producer doesn’t know the individual preferences and proposes a menu of options to consumers, letting the consumers choose their preferred one.
- *Third degree price discrimination*: The producer doesn’t know the individual preferences, but charges different prices to groups of consumers with different characteristics.

There is price discrimination when two transactions of the same good occur at different prices despite having the same cost. Successful, from the company’s perspective price discrimination (that is one that cannot be defeated by consumers switching to other producers) requires some conditions, including (i) market power, (ii) the ability to distinguish customers, (iii) the ability to prevent resale. Personalised pricing improves the ability to distinguish customers and may lead to first degree price discrimination, as well as third degree price discrimination, when it is possible for the firms to apply group pricing, discriminating between groups of consumers. Subjecting to price discrimination final users may enable the producer to capture the entire consumer surplus, generate

2920 See, I Lianos, ‘Brands, Product Differentiation and EU Competition Law’ in D. Desai, I. Lianos & S. Weber Waller (eds.), *Brands, Competition Law and IP* (Cambridge University Press, 2015), (discussing the ‘persuasive view’ of advertising in economic literature).

2923 *Ibid.*

unequal treatment of various individual consumers or groups of consumers, and affect competition with other producers (not necessarily of the same relevant market), in the sense that by enabling the producer to charge a specific consumer as high as his willingness to pay, reduces the available income of the consumer to make other purchases. Different producers compete for the limited resources/budget of a consumer or a group of consumers. As a result consumer welfare suffers, in comparison to the counterfactual, which is here perfect competition and uniform pricing that is marginal cost pricing (might in digital markets may be close to zero).

Personalised pricing or “price targeting” has been observed in various markets.²⁹²⁴ To the extent that this manipulation may result in welfare losses for individuals, or group of consumers, in the sense that the specific individual, or the specific group of consumers, could find its/their situation worse off, in comparison to a counterfactual where no such digital manipulation would have taken place, it can be argued that these deviations from the counterfactual situation need to be corrected through State intervention, eventually by competition law enforcement. But this is a matter for debate. One may argue that personalised pricing should not be considered as a form of ‘manipulation’, but as a technological opportunity to charge each consumer as much as her/his willingness to pay is. This may, for instance, enable some consumers that would not have been able to purchase the specific product, if a uniform price would have been implemented and would have been higher than their willingness, to afford the product. ‘Personalised pricing’ may therefore have ambiguous welfare effects, depending on the market structure and the trade-off between the market ‘appropriation’ effect to consumers with high willingness to pay versus the ‘market expansion’ effect to consumers with a low willingness to pay.²⁹²⁵ In *Asnef-Equifax*, when examining the possible efficiency gains brought by a restrictive to competition information exchange, the CJEU held that when performing the trade-off under Article 101(3) TFEU ‘[...] it is the beneficial nature of the effect on *all* consumers in the relevant markets that must be taken into consideration, not the effect on *each member* of that category of consumers’²⁹²⁶. Hence, it seems that this assessment should be done at a general level, the representative consumer of the specific relevant market.

One may also argue that EU competition law’s focus on distributive justice, in particular its emphasis on the position of ‘consumers’, who should not be worse off following the specific conduct, may justify competition law intervention if the additional benefits from personalised pricing are not passed on to them, either in the form of lower prices, or in the form of better quality and/or innovative products. Competition law intervention may

2926 Case C-238/05, *Asnef-Equifax, Servicios de Información sobre Solvencia y Crédito, SL v Asociación de Usuarios de Servicios Bancarios* (Ausbanc), ECLI:EU:C:2006:734, para. 70 (emphasis added).

also be motivated by fairness considerations (value ethics), in particular if personalised pricing is not transparent and thus consumers are not informed, or the need to limit an extensive use by the firms practising algorithmic discrimination of consumers' sensitive personal data, in view of the purpose limitation and data minimisation requirements in the Data Protection regulation.²⁹²⁷ These practices may also raise more conventional competition law concerns, as they discourage consumer search by making it harder or more expensive to return to buy after a search for alternatives, with the effect that the matching of products to consumers is sub-optimal and that consumers, on aggregate, may finish paying higher prices.²⁹²⁸

There are different ways to deal with personalised pricing, from a competition law perspective. In the EU, it is possible that such practices may be qualified as a form of price discrimination under Article 102(c).²⁹²⁹ Article 101(1)(d) TFEU also prohibits agreements that "apply dissimilar conditions to equivalent transactions with other trading parties, thereby placing them at a competitive disadvantage." Article 102(c) utilizes almost identical language to inhibit dominant undertakings from engaging in price discrimination. EU competition authorities have focused price discrimination enforcement on dominant undertakings. Among the conditions for the application of this provision, there is the requirement that the "other trading partners" are placed at a "competitive disadvantage", which may suggest that this provision may not apply to discrimination on price or other parameters of competition against final consumers. However, this language has not impeded the Commission to apply Article 102(c) to final consumers in *Deutsche Post*, in particular consumers of postal services, which due to the behaviour of Deutsche Post were affected negatively by having to pay prices for these services which were "higher than those charged to other senders and by having their mailings delayed significantly" The Commission noted that

"Article [102 TFEU] may be applied even in the absence of a direct effect on competition between undertakings on any given market. This provision may be also be applied in situations where a dominant undertakings behaviour causes damage directly to consumers."²⁹³⁰

Also note that the case law does not require evidence of a competitive disadvantage, which in some cases has been presumed.

2927 Art. 5(1) of Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation – GDPR), [2016] L 119/1. See also Art. 9(1) GDPR and Section 2 of the Data Protection Act 1998 which require the data controller when processing personal data to obtain a specific and explicit consent to process these categories of data.

2928 M Armstrong & J Zhou, 'Search Deterrence' (2016) 83 Review of Economic Studies 26

2929 See, Autorité de la Concurrence & Bundeskartellamt, Competition Law and Big Data (May 10th, 2016), 21-22, noting that although the application of EU competition law to these practices may be debated, in Germany, the Federal Supreme Court found that the national provision against the abuse of a dominant position can include a consumer protection dimension as regards price discrimination, see German Federal Supreme Court (BGH), „Entega II“, KZR 5/10, judgment of 07.12.2010.

2930 Commission Decision COMP/C.1/36.915, Deutsche Post AG, [2001] OJ L331/40 (not appealed), para 133.

Alternatively, personalised pricing may be attacked through Article 102(a) if it can be qualified as ‘directly or indirectly imposing unfair purchase or selling prices or other unfair trading conditions,’ for instance because it has led to the imposition of a higher price (or lower quality) than what would have been the case but for the specific digital manipulation and enables the producer to capture the entire consumer surplus. Of course, should this route be followed, it would be important to design a test with more specific conditions than just the fact that there is no reasonable relation between the price charged to the consumer and the “economic value” of the product supplied, as personalised pricing aims precisely to set the price at the exact level the specific consumer thinks is the ‘economic value’ of the product (subjective perception of value that corresponds to the subjective willingness to pay of this specific consumer), which from an economic efficiency perspective should not be problematic. However, one may argue that the principle of ‘open market economy’ would require that economic value should be set in the context of a competitive process taking place on a market, where various actors, consumers and suppliers interact, in view of the fact that ‘competition is, by its very essence, determined by price.’²⁹³¹ Hence, charging a consumer a personalised price that would correspond to her/his willingness to pay, without him being aware of this and without enabling the specific consumer to benefit from the competitive process taking place at the ‘open market’ and the source of information this may provide so as to enable informed comparison with regard to the situation of other consumers may contravene to ‘the principle of an open market economy with free competition.’²⁹³² This is particularly important as one may argue that consumers value the competitive process as such, and not just the fact that the price of a product is within the range of their willingness to pay, which is also something that cannot be set in advance, but essentially cultivated in the context of a market involving continuous interactions between buyers and sellers. That said, it is important to explore if competition law is the best legal instrument to deal with welfare-reducing targeted pricing, or if other alternatives, such as consumer protection law, data protection and privacy rules, anti-discrimination law, unfair commercial practices law, free movement law, regulation, may prove to be more appropriate, following a detailed comparative institutional analysis.²⁹³³

2931 Opinion of Advocate General Szpunar in Case C-148/15 *Deutsche Parkinson Vereinigung eV v Zentrale zur Bekämpfung unlauteren Wettbewerbs eV* EU:C:2016:394, para.18.

2932 This principle is mentioned in Articles 119, 120 and 127 TFEU.

2933 See, M Bourreau et al., *Big Data and Competition Policy: Market Power, personalised pricing and advertising*, CERRE Project Report (February 2017), 45-47, noting restrictions on personalised pricing from data protection rules (the need to have the explicit consent of the data subject involved), consumer protection rules (disclosure to consumers about the prices and how they are calculated), unfair commercial practices (prohibiting in certain circumstances consumer profiling and considering this as a misleading commercial practice), free movement law (the Services’ directive prohibitions to discrimination based on the service recipient’s nationality or residence), as well as specific regulations on geo-blocking (see Proposal for a Regulation of the European Parliament and of the Council on addressing geo-blocking and other forms of discrimination based on customers’ nationality, place of residence or place of establishment within the internal market and amending Regulation (EC) No 2006/2004 and Directive 2009/22/EC, COM(2016) 289 final), or the application of competition law provisions against geo-blocking.

11.3.2.3. Unfair commercial practices and trading conditions

The exploitation of trading partners may not only take the form of higher prices. In some competition law regimes, the imposition of ‘unfair trading conditions’ (UTC) or ‘unfair commercial practices’ (UCP) may also constitute an abuse of a dominant position,²⁹³⁴ and this even if other areas of law, such as unfair competition or contract law may also apply in this occasion. The concepts of UTC and UCP are quite broad, and fuzzy, thus offering an important policy discretion to competition authorities and a high margin of interpretation to the courts to frame the scope of this legal category in the way they find appropriate. In some well-established case law, the Court of Justice of the EU considered that contractual provisions that have an ‘inequitable nature’ may constitute an abuse, ‘bearing in mind both the intrinsic individual effect of those clauses and their effect when combined.’²⁹³⁵ Similarly, the CJEU found abusive contractual clauses ‘making access to [a distribution] network conditional upon the firms accepting unfair terms in the distribution agreement,’ these constituting UTC.²⁹³⁶ These practices need not derive directly from the contract but may also consist in measures unilaterally adopted by the dominant undertaking, not always in the context of a pre-existing contractual relation. National competition authorities have been quite active on this front, even for non-dominant undertakings.²⁹³⁷ Although this case law on UTC and UPC focuses on practices affecting other undertakings (B2B), there is nothing that would impede these from also applying with regard to UCP and UTC affecting final consumers (B2C), as there is not distinction between situations in which the dominant undertaking is in competition, or not, with its trading partner downstream or upstream. Hence, the provisions prohibiting an abuse of a dominant position could also cover conduct imposing unfair conditions to final consumers that would lead to a reduction of the quality of the services provided and other exploitative effects, such as the extraction of personal data without the user’s consent.

This raises, however, the question of what may constitute UCP or UTC under EU competition law, and how could this type of abusive conduct include non-price and privacy related theories of harm. The case law does not provide clear limiting principles. Some recent soft law and preparatory documents relating to the adoption of the Directive

2934 See, for instance, Article 102(a) providing as an example of abuse ‘directly or indirectly imposing [...] unfair trading conditions.’

(rendering conditional the sale of the product to the use of the dominant undertaking’s repair and maintenance services, such obligation being considered as going beyond protecting the dominant undertaking’s ‘commercial interest’ and thus be disproportional); Case T-203/01 *Manufacture Francaise des Pneumatiques Michelin v EC Commission* [2003] ECR II-4071, para 141 (indicating how rebate conditions that are indeterminate and non-transparent may also constitute UTC).

2937 A. Renda et al., Study on the Legal Framework Covering Business-to-Business Unfair Trading Practices in the Retail Supply Chain – Final Report (February 26, 2014), available at <https://publications.europa.eu/en/publication-detail/-/publication/c82dc8c6-ec15-11e5-8a81-01aa75ed71a1/language-en>.

concerning unfair business-to-consumer commercial practices,²⁹³⁸ the Directive on unfair trading practices in business-to-business relationships in the food supply chain,²⁹³⁹ or the recent EU proposal for a regulation on promoting fairness and transparency for business users of online intermediation services,²⁹⁴⁰ may provide a source of inspiration for this case law to develop further. One needs of course to distinguish between the interpretation of Article 102 TFEU of the Treaty and the emergence of some EU unfair competition law: the fact that a practice constitutes, or not, an 'unfair' commercial practice under the EU Unfair Trading Practices in the food sector or the EU Regulation on fairness in the context of intermediation platforms, should not have an immediate bearing on the qualification of such practice as an UCP or UTC prohibited by Article 102(a) TFEU. However, it does constitute a factual element that needs to be taken into account when interpreting the meaning that the prohibition of 102(a) on unfair trading conditions. Some common elements seem to define the concept of UPC and UTC in this context. The Commission has 'broadly' defined UTC as 'practices that grossly deviate from good commercial conduct, are contrary to good faith and fair dealing and are unilaterally imposed by one trading partner on another.'²⁹⁴¹ In defining the problem requiring intervention, the Commission also insisted on the 'transfer of excessive risk and costs to weaker parties' and a 'diminished part of added value' for the 'weaker' parties as some of the implications of UTC in the presence of an unbalance of bargaining power.²⁹⁴² The overall concept thus refers to practices of value capture that lead to an 'unfair' division of surplus between the actors involved. However, the way the concepts of UPC or UTC have so far been conceptualized in these texts is intrinsically linked to the B2B dimension of vertical competition these rules aim to regulate, as it assumes that the 'weaker' actor is an undertaking taking risks, rather than a final consumer. Hence, such conceptualisations may provide useful insights but certainly do not exhaust the conceptual potential of the UTC and UPC.

A recent case brought by the German competition authority against Facebook (*Bundeskartellamt, BKA*) raises interesting issues as to the possible extension of Article 102 TFEU to cover abuses resulting from the exploitation of consumers by digital platforms when harvesting consumer (personal) data.²⁹⁴³ Facebook collected the data of its users by merging the various sources of personal data generated by the use of Facebook-owned services, such as WhatsApp or Instagram, or by the use of third party websites and apps, which ‘embedded’ Facebook products through the ‘like’ button and the use of Facebook analytics. The BKA differentiated between user data that were generated through the use of Facebook, and user data obtained from third party sources, either controlled by the Facebook corporate group, such as Whatsapp, Oculus, Masquerade, or through the use of Facebook programming interfaces in websites or mobile apps in third party providers websites (via the Facebook developer platform and Facebook Business Tools), these being data not generated by the use of Facebook’s social network and for which Facebook has not received the user’s consent.

The BKA raised concerns with regard to the possible existence of an abuse of a dominant position as Facebook made the use of its service conditional upon the user granting the company extensive permission to use his or her personal data, even those generated off-Facebook use, in particular through the possibility of Facebook to gather user-related and device-related data gathered and saved during either the use of the Facebook-owned third parties or through the Facebook Business Tools in third-party websites. Users were, therefore, no longer able to control how their personal data was used. The decision focused on the infringement of German competition law, in particular Section 19(1) GWB which prohibits unfair conduct by a dominant undertaking vis-à-vis other undertakings. The BKA noted that Facebook’s users were oblivious as to which data and from which sources were being merged to develop a detailed profile of their identities and their online activities.

In determining the existence of abuse, the BKA delved into the analysis of Facebook’s terms of service and data policy. It examined whether Facebook’s data processing terms were admissible in view of the principles of the harmonised European data protection rules (EU General Data Protection Regulation). In doing so BKA indicated that a violation of EU data protection law could give rise to an abuse of a dominant position. This approach is consistent with that followed by the other German competition authority, the Monopolkommission, in proceedings pending before it. According to the Monopolkommission, an infringement of statutory provisions other than those relating to competition becomes a competition law problem if the infringement is either the result of a dominant position or it confers a competitive advantage which allows the dominant undertaking to distort competition.²⁹⁴⁴ Considering that Facebook’s merging of the data constituted a violation of the users’ constitutionally protected right to informational self-

2943 Bundeskartellamt, Facebook decision (2019), https://www.bundeskartellamt.de/SharedDocs/Entscheidung/EN/Entscheidungen/Missbrauchsaufsicht/2019/B6-22-16.pdf?__blob=publicationFile&v=5.

2944 Monopolkommission, ‘Sondergutachten 68: Wettbewerbspolitik: Herausforderung digitale Märkte’ (June 2015) Tz. 517. <<https://www.monopolkommission.de/de/gutachten/sondergutachten/sondergutachten-68.html>>.

determination, the BKA decided that the specific provision of German competition law prohibiting conduct of dominant undertakings (§ 19 GWB) could apply.

Facebook challenged these conclusions, arguing that there was no causal link between the alleged abusive conduct by Facebook and a dominant position on the market, as a number of other non-dominant companies were employing the same practices²⁹⁴⁵. The BKA rejected this argument noting that these terms and conditions and data policy infringed Section 19 GWB, 'because, as a manifestation of market power, these terms violate the principles of the GDPR'²⁹⁴⁶. It seems therefore to establish a direct link between an infringement of competition law and an infringement of the principles of data protection. The BKA referred to past case law of the German Federal Court of Justice which stipulated that 'principles from provisions of the legal system that regulate the appropriateness of conditions agreed upon in unbalanced negotiations can be used as concepts for appropriateness in the assessment of abusive practices under Section 19(1) GWB.'²⁹⁴⁷ The BKA inferred from this case law the general principle that 'an abusive practice can also be found based on the general clause of Section 19(1) GWB prohibiting an abuse of a dominant position by one or several undertakings, e.g. where general business terms are used 'that are inadmissible under the legal principles of Sections 307 and subsequent provisions of the German Civil Code (BGB),'²⁹⁴⁸ and in particular where these practices also represent a manifestation of market power or superior market power.'²⁹⁴⁹ This allows for a quite broad interpretation of the scope of abusive business terms (and potentially of their EU law equivalents UTP or UTC), in particular as the BKA also insisted that determining whether the business terms are abusive necessitates 'an extensive balancing of interests... which should also take into account constitutionally protected rights.'²⁹⁵⁰ Hence, Section 19 GWB 'should be applied in cases where one contractual party is so powerful that it would be practically able to dictate contractual terms, thus eliminating the other party's contractual autonomy.'²⁹⁵¹

In interpreting the prohibition principle in Section 19(1) the BKA was inspired by the content of some of the examples of abusive conduct mentioned in Section 19(2) GWB, and in particular 19(2)1 and 19(2)2. One may determine the abusive nature of the trading conditions and commercial practices from a comparison of business terms 'which differ from those which would very likely arise if effective competition existed', in particular by taking into account the conduct of undertakings in comparable markets where effec-

2945 Ibid., para.156.

2946 Ibid., para 523.

2947 Ibid., para. 526.

2948 According to Section 307 BGB, '(1) Provisions in standard business terms are ineffective if, contrary to the requirement of good faith, they unreasonably disadvantage the other party to the contract with the user. An unreasonable disadvantage may also arise from the provision not being clear and comprehensible. (2) An unreasonable disadvantage is, in case of doubt, to be assumed to exist if a provision 1. is not compatible with essential principles of the statutory provision from which it deviates, or 2. limits essential rights or duties inherent in the nature of the contract to such an extent that attainment of the purpose of the contract is jeopardised.'

2949 Ibid., para. 527.

2950 Ibid.

2951 Ibid.

tive competition exists, according to Section 19(2)2. However, this is not the only way to determine the abusive and unfair nature of business terms and trading conditions, the BKA referring to the broader ‘appropriateness principle’ which ‘is based on constitutional values, the principles of the legislation on unfair contract terms and other civil law general clauses.’²⁹⁵² The aim is to preserve the ‘constitutionally protected right to self-determination in business affairs (commercial freedom) because the other part is able to *unilaterally* determine the terms of the contract.’²⁹⁵³ This unilateralism in the determination of the conditions of the contract breaks with the usual assumption in contract law about the existence of a mutually beneficial agreement based on consent and a meeting of minds. It hints to the fact that the transaction in question may be better described by the concept of ‘uncontract’ that we have commented upon in Chapter 2.²⁹⁵⁴

This legal construction enables the BKA to integrate in the context of the enforcement Section 19 GWB any restriction to the duty of ‘appropriateness’ included, more broadly, in the ‘constitutional principles’ involved in the protection of the right to informational self-determination and the fundamental right to data protection’ and the principles of relevant legal provisions, such as the rules concerning the appropriateness of data use, included in the data protection legislation (GDPR).²⁹⁵⁵ This quite broad construction of abusive business terms by the BKA seems limited by the requirement that ‘a sufficient degree of market power is involved’²⁹⁵⁶ and by the fact that data protection law follows similar goals to the prohibition of abusive business terms in competition law, in particular in its role as a ‘special economic law’ which aims to achieve ‘a balancing of interests between data processors and the consumers’ and ‘counter power asymmetries between organisations and individuals’²⁹⁵⁷. The BKA also takes a broad view of the concept of abusive business terms as it includes data processing terms and data policies, considered as part of the terms of service, in view of the regulatory character they have from the perspective of users.²⁹⁵⁸ Hence the BKA arrives to the conclusion that ‘abusive business terms pursuant to Section 19(1) GWB could also be examined... with respect to a violation of Section 307 BGB which in turn refers to the mandatory principles of the GDPR.’ This raises the question of the relationship between competition law and data protection law, which was examined in Chapter 4.²⁹⁵⁹

The BKA seems to proceed to a reasoning in two steps. First, it acknowledges that Facebook’s terms and conditions and data policies constitute a violation of GDPR data protection values.²⁹⁶⁰ It proceeds to a very detailed analysis of the GDPR framework and the possibilities of justification that Facebook could have put forward as part of the data

protection law assessment. The BKA takes issue with Facebook's data processing, in particular profiling, in particular the fact that information collected in Facebook-owned separate websites are used for profiling purposes on Facebook, and rejects the argument put forward by Facebook which claimed that the fact that these companies form part of its corporate group would have enabled it to use this data without infringing the GDPR. The BKA delves into the analysis of the concept of 'group of undertakings' in Article 4(9) of the GDPR and concludes that contrary to Facebook's view, no group privilege may be derived. Interestingly, in interpreting the GDPR the BKA notes that 'intra-group transactions are not generally exempt from abuse control if they have restrictive effects on competition', giving the example of bundling products within the same group, that would have raised, if accepted, the risks of transfer of market power or exploitation of the opposite side of the market²⁹⁶¹. This reference to competition law aims to establish some form of conceptual coherence between these two separate regimes, although the BKA is careful to note that this is a response to Facebook's argument that competition law recognizes group privileges. Following a quite thorough analysis, the BKA also finds no justification of such practices under Articles 6 and 9 of the GDPR. In particular, the BKA notes the absence of voluntary consent by the users for this data aggregation, in view of the take-it-or-leave it and conditional nature of the exchange and the 'clear imbalance' between the data controller and the data subject in this case, as Facebook disposes of a dominant, almost quasi-monopolistic, position on the market²⁹⁶². Indeed, 'it cannot be assumed that individuals give their consent voluntarily since users are forced to consent to data processing terms when they sign up for a service provided by a company that has a dominant position in the market.'²⁹⁶³ 'Free choice' within the meaning of data protection law cannot be assumed in the presence of such 'clear imbalance.' Finally, the BKA notes that the need to process data collected from other Facebook-owned services or third parties is not necessary for the performance of the contract with the Facebook user, in particular as the contents of the contract are unilaterally imposed on the data subject by the data controller. The BKA observed that Facebook has a 'special responsibility' when considering the necessity of the data processing conditions unilaterally imposed, in view of the difficulty of users to evade the terms of service of Facebook in view of its dominance and hence one needs to examine thoroughly the existence of voluntary consent for the processing of data. It also rejected Facebook's argument that the data processing was necessary for contractual purposes, as it enabled a more personalized user experience and the need to improve the quality of the service to the users. The BKA noted that '(t)his view means the company would be entitled to unlimited data processing solely on the grounds of its business model and product properties as well as the company's idea of product quality', something that the BKA categorically rejected²⁹⁶⁴. Indeed, the BKA observed with regard to the collection of data of Facebook use that this was not necessary as Facebook could have achieved a high degree for personalization with the data generated from the Facebook website

2961 Ibid., para. 613.

2962 Ibid., paras 645 & 646

2963 Ibid., para. 643.

2964 Ibid., para. 692.

itself²⁹⁶⁵. This is particularly interesting as it may constitute an argument that may also be relevant in the context of excessive data extraction claims and would neutralize the argument often put forward by digital platforms that data extraction is not excessive to the extent that it improves the quality of the product, for instance through increased personalization. One may also doubt of the effectiveness of this argument in view of the fact that this increased personalization may lead to instances of future exploitation, and not just for enabling targeted advertising. As the BKA notes, '(a)nother particularly problematic aspect' of such data processing as the aggregation of data across Facebook-owned and third party websites enables 'active fingerprinting' and 'detailed profiling' of the users that 'leads to a massive additional invasion of privacy, since profiling tracks the affected users via an immense number of websites and apps, and the captured data is combined both with the data from Facebook-owned services and with the Facebook user data.'²⁹⁶⁶

It is remarkable that although the BKA made efforts to interpret the relevant provisions of the GDPR according to data protection law, it frequently made references to and used analogical reasoning when interpreting the GDPR with regard to competition law. For instance, it challenged Facebook's claim that the aggregation of this data across the various websites owned by Facebook aimed to promote 'consistency of the user experience' by noting that integrating services or functionalities, and share user data, 'is problematic under antitrust law' in view of the leveraging or maintenance of market power concerns that this may raise and the possibility to exclude other market players, create barriers to new entrants and enhance the lock-in effect by making switching providers more difficult.²⁹⁶⁷

In exploring the compatibility of Facebook's practices to the GDPR, the BKA took into account the legitimate interests of the affected stakeholders, in particular third parties, such as advertisers that want to buy targeted advertising from Facebook, and Facebook users. Of particular interest is the fact that the German competition authority has also framed the issue as relating to the protection of the citizens' constitutionally protected rights to 'informational self-determination.' To do this, the BKA did not, as usually competition authorities do, rely only on the preferences of the users/consumers as these are revealed in the marketplace, but made reference to the interests of the users/citizens as these 'revealed' in constitutional principles. The authority considered the promotion of 'informational self-determination' a socially valuable aim, as it is constitutionally protected, and did so without relying on consumers' preferences. According to the BKA, to the extent that the 'information sovereignty' of users is affected by continuous distortions by governments and businesses which are 'increasingly able to create detailed profiles predicting their behaviour (thereby exacerbating information imbalances and undermining personal autonomy) it is all the more important to ensure that the interests of individuals in the protection of their privacy and autonomy are safeguarded.'²⁹⁶⁸

2965 Ibid., para. 744

2966 Ibid., para 847.

2967 Ibid., paras 747-739.

2968 Ibid., para. 760.

Interestingly, the authority could have also focused on the quality dimension of competition and its reduction by the ‘loss of control’ of the users as they were no longer able to control how their personal data were used. However, the BKA made no effort to build such a quality narrative, simply because it would have had to explain why the users had not switched to different social networks if ‘informational self-determination’ was a parameter of quality and variety competition. For this to happen, the price revealed preference (or a contingent valuation method) would have required some analysis of substitutability between social networks that respect informational self-determination and those, like Facebook, that violated this principle. In contrast, the evidence basis on which the BKA seems to have built its theory of harm relates more to the citizens’ right to informational self-determination/privacy, as these are proclaimed and protected by the German constitution and data protection law.

The BKA balanced these rights of Facebook users for self-determination with the rights of Facebook for entrepreneurial freedom. In providing the balancing the German authority noted that the legitimate interests of Facebook cannot outweigh those of the Facebook users, in particular as the data processing was not necessary, and in view of the broader harms and disadvantages that such processing would impose on the data subjects, in particular for certain sets of sensitive data, type of data processing, the data subjects’ reasonable expectations and the position of the data comptroller.²⁹⁶⁹ With regard to the last factor, the BKA took into account the fact that ‘as a multinational company with a dominant position in the market, Facebook has the negotiating power to impose extensive data processing unilaterally on users’, in view of its ‘special bargaining power.’²⁹⁷⁰ This assessment of the position of Facebook was found relevant for performing the balancing of interests of the data subjects and data comptrollers and third parties according to data protection law. The BKA found relevant for this assessment the fact that Facebook unilaterally imposed these conditions on data processing to the users in its terms and conditions and data policies and that such policies present the ‘risk of further strengthening Facebook’s market power vis-à-vis-users by transferring this market power to other services’, thus by the same ‘strengthening the bargaining power and the possibility of imposing terms unilaterally.’²⁹⁷¹ These concerns are very well inspired by competition law theories of harm, such as leveraging and monopoly maintenance, now repurposed for the occasion as data protection theories of harm. Such harm may, according to the BKA, be even more important for users with some degree of vulnerability, such as adolescents.²⁹⁷² This introduces a horizontal fairness dimension as it makes possible the distinction between different groups of users, according to the degree of their vulnerability vis-à-vis the data comptroller. This detailed interests balancing was performed for both the conduct involving the processing of data harvested by Facebook-owned services, as well as those collected through the Facebook Business Tools, again arriving to a similar conclusion that the rights of the users outweigh those

2969 Ibid., para. 767.

2970 Ibid., paras 783 & 785.

2971 Ibid., para 785.

2972 Ibid., para. 786.

of Facebook and other third parties.²⁹⁷³ By finding that the GDPR-based justifications for Facebook's conduct did not apply, in view of the 'gross imbalance' between the interests of Facebook, only some of which are legitimate, and the protection of users' fundamental rights, the BKA concluded as to the existence of an infringement of the principles of the GDPR. This however did not automatically result to a competition law infringement, the BKA proceeding during the second step of the analysis to the competition assessment of this conduct.

Second, the BKA analysed how the infringement of data protection may be abusive within the meaning of the competition law provisions, in particular Section 19(1) GWB. The analysis here is structured in two sub-steps, the BKA first observing that there is some causal link between Facebook's market power and the abusive, according to data protection law, data processing conditions it imposes to its users, and then proceeding to a balancing of interests under antitrust law. With regard to the first step, the BKA adopted a rather flexible concept of causal link, not requiring evidence that the dominant position/market power was a necessary prerequisite for the specific abuse, but rather a sufficient condition. According to the BKA, 'the required link with market power is therefore not to be construed within the meaning of a strict causality of market power, requiring proof that data processing conditions could be formulated in such a way precisely and solely because of market power.'²⁹⁷⁴ Causality is thus perceived from a normative perspective, as a causality in relation to the outcome, rather than as a causality in the form of a strict counterfactual or but for test that aims to determine a single, most important causal factor.²⁹⁷⁵ According to the BKA, 'there is a normative-causal connection in the vertical relationship with private users between the existence of a dominant position in the market and the violation of the relevant assessments under data protection law', bringing it to the conclusion that the violation of data protection requirements in this case 'is a manifestation of Facebook's market power.'²⁹⁷⁶

Although this does not mean that this step of the antitrust analysis completely merges with the analysis under data protection law, at least at a conceptual level, in practice it becomes unclear how the two may refer to different issues. The BKA proceeds by integrating traditional competition law concerns over market power and the special responsibility of dominant firms in data protection law, putting some effort in advancing the conceptual consistency between these two regimes. Hence, it is now argued, as a matter of data protection *and* competition law that 'companies behaving in a similar way that do not have a dominant position in the market would need to be assessed differently' than undertakings with market power.²⁹⁷⁷ This brings the BKA to argue that data protection law takes into account the individual circumstances of the company, in particular its market dominance, in particular in the way it assesses the way the data was processed and possible justifications. It also enables it to reject the idea of accepting the data har-

²⁹⁷³ Ibid., para. 836.

²⁹⁷⁴ Ibid., para. 873.

²⁹⁷⁷ Ibid., paras 879 & 882.

vesting and processing allegedly violating data protection law as an ‘established industrial standard’ justifying Facebook’s policies to the extent that smaller rivals proceed to similar practices. According to the BKA, accepting this ‘could lead to the paradoxical outcome that smaller competitors... might be tempted to act in violation of data protection law under the “umbrella” of the dominant undertaking and the dominant undertaking could then refer to competitors’ conduct to justify its own behaviour.’²⁹⁷⁸ For the reasons mentioned above, the BKA does not have issue with the fact that under its interpretation a dominant undertaking, such as Facebook, may be subject to stricter data protection requirements than non-dominant undertakings.

Notwithstanding these remarks about the existence of a normative causal link, the BKA also considered that there was a strict causality between the data policies found problematic and Facebook’s dominant position as there was at least some ‘correlation’ of the violation of data protection law with market power.²⁹⁷⁹ The interpretation of the existence of a causal link becomes more apparent when the BKA examines the causal relationship between the unlawful data processing and Facebook’s market dominance with regard to the possible harm to competitors. The BKA notes that in advertised-based platforms, there is a high incentive for the platform to adopt problematic data processing practices that give access to the users’ data harvested from Facebook-owned services or third parties, as this helps the platform to make attractive offers to advertisers in the form of targeted advertising.²⁹⁸⁰ This risks however ‘transferring market power’ by making it more difficult for users, because of enhanced personalisation also in the context of these services, and the standardisation of product experience throughout Facebook-owned services to switch providers, thus reinforcing the network effects.²⁹⁸¹ This may also increase barriers to entry for potential competitors in the market for social networks.

The second sub-step is the performance of a balancing of interests, this time under antitrust law, taking into account the objective of the German competition Act to promote free competition. However, strikingly, the BKA holds that if the terms of business violate data protection values *as a result of* market power, then the antitrust balancing does not have ‘any independent significance’ to the data protection balancing, thus effectively creating a presumption of anticompetitive effect if there is violation of data protection law in conjunction with evidence of some causal link, and this as indicated in the previous paragraph is determined rather liberally a simple correlation being found sufficient evidence, with the existence of market power. This does not impede the BKA to perform such balancing in this case, as a precaution, noting however that in this case this ‘leads to the same outcome as the balancing of interests under data protection law.’²⁹⁸² The necessity of independent additional balancing under antitrust law is according to the BKA challenged by the previous case law of the Federal Court of Justice, which empha-

2978 Ibid., para. 884.

2979 Ibid., para. 880.

2981 Ibid.

2982 Ibid., para. 889.

sises that ‘if an infringement (of data protection law) is the result of market power...the abusiveness can no longer be called into question by a further (antitrust) balancing of interests.’²⁹⁸³ This rather blunt observation hints to the possibility that the BKA applies to conduct infringing data protection law a presumption of illegality under competition law, if there is some evidence of dominant position and of a loose causal connection between the conduct and the dominant position. This is explained from BKA’s conception that ‘the antitrust concept of the appropriateness of conditions relies on comparable concepts of appropriateness defined in other legal areas in similarly unbalanced negotiation situations such as legislation on general terms and conditions or data protection law’, these appropriateness rules in these other legal areas being ‘themselves the result of a balancing of interests with regard to the necessary reconciliation of interests in the negotiation of terms and conditions.’²⁹⁸⁴ The BKA also notes the similarity of the balancing factors, one of which is dominance, in both antitrust and data protection law, leading to the same outcome, which explains that the balancing of interests may be done ‘simultaneously under antitrust and data protection law.’²⁹⁸⁵ Interestingly, the enforcement of Section 19(1) GWB is seen as aiming to bring about ‘a balance of interests while taking the parties’ constitutional rights into account.’²⁹⁸⁶ The reference to constitutional norms and principles as meta-principles guaranteeing consistency of interpretation between antitrust and data protection law duties to dominant firms, in particular regarding the obligation to include assessments with regard to constitutional rights in assessments of interests under competition law, following the case law of the German Federal Court of Justice in *Pechstein*.²⁹⁸⁷ This is particularly significant, in particular in the presence of a dominant company imposing unilaterally problematic data policies and terms and conditions because it is ‘not subject to sufficient competitive control,’²⁹⁸⁸ even more so ‘if a monopoly or quasi-monopoly exists.’²⁹⁸⁹ The BKA observes that this makes it possible in the specific case of Facebook ‘to determine the abuse directly by comprehensively balancing interests, taking the constitutional rights of the contracting parties into account with regard to the exclusion of voluntary self-determination as a result of market dominance.’²⁹⁹⁰ Essentially, this makes it possible to refer ‘to the assessments under data protection law for the balancing of interests under antitrust law’, to the extent that there is already ‘a statutory decision on the balancing of fundamental rights’ under the GDPR (Article 6(1), this ‘technical substantiation’ also applying to the antitrust perspective. For the BKA this ‘unifies the balancing framework.’²⁹⁹¹ The BKA nevertheless makes some effort to connect the violation of data protection norms to some competition law theory of harm, hence the emphasis put on the reduction of consumer choice

that an unlimited data processing from the dominant firm would have, as users are not be able to switch to less intensive from a data processing perspective alternatives. The only choice left to users for avoiding this data processing would be to cease using the internet to a large extent or stop using popular services, such as WhatsApp.²⁹⁹² The BKA does not take issue with the lack of an economic quantification of the abusive conduct in terms of comparing the net consumer harm and benefit to a counterfactual, as it is often the case for analysing other exploitative practices, such as excessive pricing.²⁹⁹³ Such economic quantification 'hardly seems possible' in this case. However, this cannot challenge the finding of consumer harm. As the BKA notes, 'it can be assumed that the conduct contested can also lead to potential user harm in economic terms', as '(e)ven the collection of data itself can lead to behavioural changes among users.'²⁹⁹⁴ Furthermore, the BKA notes that '(u)sers might potentially suffer material (financial) harm if Facebook discloses data to third parties...leading to identity theft, extortion or fraud', but also 'non-material damage' to the extent that the collection of data 'may reveal information that the user considers worthy of protection and which is not provided voluntarily such as income, location, diseases, political views or sexual orientation.'²⁹⁹⁵ The potential of harm is even more likely to occur in view of the perverse incentives of the data controllers to harvest 'too much data', as they may benefit from the increased monetisation potential of an extensive data collection, while users 'bear the bulk of the potential financial (and intangible) costs incurred.'²⁹⁹⁶ In any case, the BKA rejected any attempt by a dominant undertaking to justify restrictions of data protection, in particular if these concern the fundamental rights of individuals on the basis of possible positive effects that such violations may bring to its economic performance. According to the BKA, 'the balanced consideration of welfare effects within the framework of the balancing of interests under antitrust law must be countered by the fact that the breach of legal protection provisions which are intended to benefit users cannot be justified.'²⁹⁹⁷ This indicates that it is not possible for the dominant undertakings to put forward objective justifications to justify the alleged anticompetitive conduct in this case, bringing the approach followed by the BKA close to establishing a per se prohibition, under competition law, for dominant undertakings to violate data protection rules if there is some loose causal link between the infringement of data protection law and the existence of market power.

The BKA's Facebook case constitutes one of the first examples of exploitative conduct cases involving UTC and UPC because of its effects on privacy. The authority made efforts to put forward a consistent interpretation of competition law to data protection law and to establish a conceptual framework that would enable the simultaneous application of both areas of law. Concepts of data protection law were repurposed for the

2992 Ibid., para. 903

2993 Ibid., para. 906.

2994 Ibid., para 909. This may hint to the possibility of behavioural harm, explored in Section 8.3.2.2., but the BKA does not provide any further detail as to the way behavioural changes may constitute harm to users.

2995 Ibid., para. 910.

2996 Ibid., para. 911.

2997 Ibid., para. 913.

occasion so as to match existing concepts and concerns in competition law, taking what has been called by some a strategy of 'cross-institutional isomorphism'.²⁹⁹⁸

Of course, the possibility for a specific conduct to fall under another area of law prohibiting abusive contractual or trading terms is always there. And different jurisdictions may arrive to different choices as to the regulatory strategy to be adopted. For instance, similar types of data harvesting have been sanctioned in Italy on the basis of consumer protection law.²⁹⁹⁹

In the US, additional possibilities are offered through specific tools, such as Section 5 of the FTC Act concerning unfair or deceptive acts or practices in or affecting commerce. In the context of the assessment of the merger between Google and Doubleclick, an FTC order required Facebook to secure consumers' affirmative consent before altering their privacy settings.³⁰⁰⁰ In 2011, Facebook settled with the FTC concerning charges that it deceived consumers when it refused to keep privacy promises. In a letter to Facebook on 10 April 2014, the FTC wrote that WhatsApp had notified users about the limited nature of the data it collects and shares with third parties, and highlighted that those promises exceeded the protections that Facebook users enjoy. The FTC wrote to warn Facebook that it must continue to honour WhatsApp's promises to consumers. Any breach could violate Section 5 of the FTC Act³⁰⁰¹. The FTC referred to WhatsApp's privacy policy, dated 7 July 2012, in which WhatsApp indicated the types of data that it collects. The FTC noted that hundreds of millions of users chose to use WhatsApp's service based on the promises of privacy that it articulated in that notice. After announcing its decision to acquire WhatsApp, both Facebook and WhatsApp publicly stated that Facebook would abide by the promises in WhatsApp's privacy policies. The FTC intimated that the statements in WhatsApp's privacy policy represented enforceable promises to consumers about the manner in which WhatsApp collects and uses their data. The FTC viewed any failure to keep promises about privacy as a deceptive practice under Sect. 5 of the FTC Act. The FTC further interpreted Sect. 5 as applying when a company uses data in ways that breach promises that had legal effect when it collected the data, unless consumers expressly consent to any changes. WhatsApp's privacy policy stated that it will not utilize customers' information for advertising purposes or sell that information to third parties for commercial or marketing purposes without obtaining users' consent. The FTC recommended that Facebook follow that procedure if WhatsApp begins to collect, use, or share data in a way that is materially inconsistent with the promises in effect when it collected the data. In that situation, consumers should have the opportunity to opt out of any changes. Alternatively, Facebook should notify consumers that they can stop us-

2998 See, I. Lianos, *Polycentric Competition Law*, (2018) 71(1) *Current Legal Problems* 161. This strategy involves the borrowing of instruments and/or the overall logic from a different institutional realm and transplant them back, 'repurposing them for the occasion.'

ing the WhatsApp service. Finally, the FTC referred to its 2011 Order enjoining Facebook from misrepresenting how it maintains the privacy or security of consumers' personal information. It reminded Facebook that the Order requires it to obtain the express consent of consumers before sharing their non-public information in a way that "materially exceeds any privacy setting.'

Issues of privacy came also up at the aftermath of the Facebook/Instagram merger. In August 2012, the FTC closed its non-public investigation of the merger between Facebook and Instagram, without taking any action. This unanimous decision permitted the parties to complete the deal.³⁰⁰² A few years later, the privacy practices of Facebook came again under scrutiny.³⁰⁰³ Users of Facebook reveal intimate information about themselves. A user's 'likes' of public Facebook pages is generally considered as an accurate indicator of that user's personality traits. Facebook had informed users that they can control the privacy of their personal information by adjusting their privacy settings. It had emphasized this ability to encourage users to share information. Starting in 2010, each user who installed an app consented, through default settings, to Facebook sharing with the third-party developer that created the app information about both the app user and the app user's Facebook Friends, despite those friends not having installed the app. Affected Friends could opt out of this disclosure only on Facebook's applications page, located on its website. They could not opt out from Facebook's privacy settings page. Third-party app developers provincially used that information to enhance the in-app experience or target advertising to app users and Affected Friends. They could use that information for identity theft, phishing, fraud, and other harmful acts.

In response to a 2012 FTC investigation, Facebook settled claims that sharing Affected Friends data with third-party developers of apps deceived users. The FTC issued an Order that prohibits Facebook from misrepresenting the ability of consumers to control the privacy of their information, the protocol to exercise the controls, and the boundaries to which Facebook adheres when making user information available to third parties.

After that FTC investigation, Facebook retained the same policy but posted a disclaimer to its privacy settings page, informing users that concerning the information they share with Facebook Friends, Facebook would make information about both parties available to the app makers. Four months after the FTC finalized the 2012 Order, Facebook removed the disclaimer while continuing to share Affected Friends data with third party developers and while still using the same separate opt-out setting. At a conference in April 2014, Facebook promised that it would cease permitting third party developers to access data about Affected Friends. Facebook informed third party developers that existing apps could continue to collect Affected Friend data for one year, until April 2015. After that date, Facebook arranged with dozens of developers, allowing them to continue to collect the data of Affected Friends. For a sub-group of app developers, that privilege lasted until June 2018.

3002 FTC Press Release, FTC Closes Its Investigation into Facebook's Proposed Acquisition of Instagram Photo Sharing Program (22 Aug. 2012), <https://www.ftc.gov/news-events/press-releases/2012/08/ftc-closes-its-investigation-facebooks-proposed-acquisition>.

3003 U.S.A. v. Facebook, Complaint for Civil Penalties, Injunction, and Other Relief, Case No. 19-cv-2184 (D.D.C. 24 July 2019).

According to the complaint, tens of millions of users relied on Facebook's privacy claims about confining the sharing of their information to Facebook Friends. Facebook knew or should have known that sharing data of non-consenting friends with app developers violated the 2012 Order because it replicated the same conduct that the Commission alleged was deceptive in the first count of the original Complaint that prompted the 2012 Order. The 2012 Order mandated that Facebook maintains a reasonable privacy program that safeguarded the privacy, confidentiality, and integrity of user information. This obligation was critical because Facebook was conveying private information from app users and Facebook Friends to millions of third-party app developers. Facebook did not track that data in an organized, systematic manner. And Facebook did not vet third party developers before bestowing access to consumer data.

The complaint argued that Facebook did not enforce its privacy terms adequately and was rather influenced by the financial benefit that third party app developers provided in return.³⁰⁰⁴ The severity of any consequences for violating its privacy terms and the speed with which they were administered depended on the financial benefit that Facebook determined that the developer offered to Facebook.³⁰⁰⁵ The FTC viewed this conduct as unreasonable.

Separate from violating the 2012 Order the complaint argued that Facebook violated Sec. 5(a) of the FTC Act by committing deceptive practices. Facebook had asked users to give personal information to benefit from security measures on the Facebook website or mobile application, including the user's phone number.³⁰⁰⁶ Facebook used the phone number as part of a two-factor authentication process. It further used the phone number to advertise to users, but never told users about the advertising purpose.³⁰⁰⁷

The final act that the FTC challenged related to privacy and facial recognition technology. In April 2018, Facebook revised its data policy to inform users that it would utilize the latest facial-recognition technology to identify people in pictures and videos that users uploaded if the user turned the feature on. This suggested that users needed to opt in to use facial recognition. Tens of millions of users who used Facebook with an older version of its facial-recognition technology needed to opt out to disable it. The contrast violated the 2012 Order by misrepresenting how consumers could control the privacy of their information.³⁰⁰⁸

Facebook ultimately agreed to pay a \$5 billion penalty and incorporate restrictions and a modified corporate structure that the FTC designed to bring more accountability for decisions the company makes about users' privacy. Facebook must create an independent privacy committee situated within Facebook's board of directors. Facebook must certify quarterly that it is complying with the privacy program mandated by the order. And it must review every new or modified product for privacy before implementing it,

while documenting its decisions about user privacy.³⁰⁰⁹

These issues may also be tackled from a data protection law perspective. These various options should not be considered as substitutes, requiring the choice of one among many possible tools, but as complements, to the extent that it is possible for a specific conduct to simultaneously constitute an infringement of competition law and another area of law (e.g. data protection law, unfair commercial practices). Such a toolkit approach may be emulated by other jurisdictions, in particular in the BRICS.

11.3.2.4. Exploitative requirement contracts

A possible theory of harm may result from the analysis of the requirement contracts bundling digital services with personal data provided in 11.2.2. The standard may be inspired from that employed against tying arrangements, although it should cater for the specific theory of harm resulting out of the reduction of privacy standards, manipulation or exploitation of consumers and a reduction of their consumer surplus or well-being. These conditions are the following: (i) the undertaking in question is dominant in the tying market (the market for the ‘free product’ (e.g. social network, search); (ii) the tying and tied goods are two distinct products (which is of course the case as there is a different market for personal data than that for search or social network services); (iii) the tying practice is likely to have an exploitation effect producing harm to the user – e.g. loss of consumer surplus, wealth transfer, reduction of innovation, reduction of privacy, behavioural manipulation and loss of autonomy; (iv) the tying practice is not justified objectively by efficiencies from which benefit the users (e.g. the data harvested improve the service or product provided to the user, in particular if personalisation has positive welfare effects. As it appears from the above this theory of harm may be standalone or be combined with one of the other theories of harm explored in this Section.

11.3.2.5. Behavioural manipulation

Although the ‘exploitation of attention³⁰¹⁰’ and ‘attention theft³⁰¹¹’ have been put forward as new forms of exploitative conduct in the digital age, the theoretical contours of these new forms of exploitation have been sketchy, and little has been done as to their operationalisation in the design of competition law standards, in addition to stressing the need for competition law to promote competitive attention markets³⁰¹². This literature lacks for the time being solid foundations on the significant research on manipulation in psychology and raises important questions as to the foundations of human consciousness.

3009 FTC Press Release, FTC Settlement imposes historic penalty, and significant requirements to boost accountability and transparency (24 July 2019), <https://www.ftc.gov/news-events/press-releases/2019/07/ftc-imposes-5-billion-penalty-sweeping-new-privacy-restrictions>.

Research in psychology (trait theory) has put forward a Five Factor Model to describe the personality trait structure for all humans and offer some measurement of character³⁰¹³. This was first developed by Louis Thurnstone in his 1933 presidential address noting the presence of five independent common factors present in more than 60 trait vocabularies describing personality traits, thus putting forward these five factors as describing the underlying dimensions of personality and temperament: these traits are Extraversion, Neuroticism, Agreeableness, Conscientiousness, and Openness to Experience.³⁰¹⁴ The five-factor model assumes that people have transcontextual personality dispositions which are highly stable over time, different situations, and social roles, these traits characterizing 'our very selves.'³⁰¹⁵ Hence, 'to be true to oneself is to behave in consistent accordance with one's own latent traits.'³⁰¹⁶ These five personality trait factors are also universal and transcultural and are linked to the biological unity of humans. Others however challenged the stability and the ahistorical and asocial nature of personality traits, arguing instead that these traits may have been influenced by culture or the specific social context and thus be culturally and historically conditioned and result out of 'cohort effects.'³⁰¹⁷

Organismic and existentially informed theories of personality advance a more 'contextual and dynamic view of the person,' their central point being that 'people do not always act in accord with their self; instead, they vary from situation to situation in the degree to which they contact and enact their true feelings and values'³⁰¹⁸. Hence, to be true to oneself within a specific role is 'to be able to behave in ways that feel personally expressive [...], authentic [...], or self-determined.'³⁰¹⁹

Behaviour is therefore function of the personality and the environment ($B=f(P, E)$)³⁰²⁰. Be-

haviorists, such as Skinner choose to focus more on the physical environment. Although not rejecting the existence of self (mind), Skinner was more interested in observable behavior, as opposed to internal events like emotion, arguing that through 'operant conditioning' an individual can make an association between a particular behaviour and a consequence.³⁰²¹ The concept of reinforcement also emphasises that behaviour which is reinforced tends to be repeated, and thus strengthened, while behaviour which is not reinforced tends to be extinguished (weakened). Behaviour may thus be influenced by reinforcers, as well as by punishers, decreasing the likelihood of the behaviour being repeated. According to behaviourists, through operant conditioning it is possible to modify and shape behaviour, for instance by a system of tokens later exchanged for rewards.

Other approaches focus on internal psychological states, even non-conscious mechanisms. Self Determination Theory (SDT) offers a motivational account of behaviour, which assumes that individuals are active organisms acting on the basis of internal structures and thus making use of both their internal and external environments. Motivation relates to 'energy, direction, persistence and equifinality; characterizing activation and intention.'³⁰²² Hence, human motivation may be intrinsic, human beings when performing an activity making use of internal structures which form part of their perception of the phenomenal core of the *self*, as well as extrinsic, to the extent that human behaviour occurs for reasons other than the activity itself. SDT theory makes a distinction between 'autonomous motivation', which comprises both intrinsic motivation and the types of extrinsic motivation in which people have identified with an activity's value and ideally will have integrated it into their sense of self, thus experiencing a 'self-endorsement of their actions', and 'controlled motivation' which, in contrast, 'consists of both external regulation, in which one's behavior is a function of external contingencies of reward and punishment, and introjected regulation, in which the regulation of action has been partially internalized and is energized by factors such as an approval motive, avoidance of shame, contingent self-esteem, and ego-involvements.'³⁰²³ Behaviour is energized and directed by both autonomous and controlled motivation, the lack of motivation and intention marking the other pole (amotivation). Psychologists distinguish six categories of regulation of an activity in the self-determination continuum, in view of the respective role of intrinsic and extrinsic motivation (external regulation) (see Figure 11.1.):

- *Amotivation*: there is no intention to act;
- *External Regulation*: which denotes extrinsically motivated behaviour which is performed to satisfy an 'external demand or reward contingency', individuals typically experiencing such behaviour feeling controlled or alienated, their actions being perceived by them as having an external locus of causality

- *Introjected Regulation*: involves taking in external regulation but ‘not fully accepting it as one’s own’, the behaviour being performed ‘to avoid guilt or anxiety or to attain ego enhancements such as pride’;
- *Identified Regulation*: involves ‘a conscious valuing; of a behavioural goal or regulation and represents a ‘more autonomous, or self-determined, form of extrinsic motivation’;
- *Integrated Regulation*: when regulation is ‘brought into congruence with one’s other values and needs, and thus fully assimilated to the self.
- *Intrinsic Regulation*: is marked by fully intrinsic motivations, the subject doing an activity for its ‘inherent satisfactions’³⁰²⁴

An ‘enormous amount’ of research, including empirical, shows that autonomous motivation, which we can locate as including the categories of intrinsic motivation, integrated regulation and identified regulation, ‘tends to yield greater psychological health and more effective performance on heuristic types of activities.’³⁰²⁵ Research shows that ‘there is a set of universal psychological needs that must be satisfied for effective functioning and psychological health’, in particular the needs for competence, autonomy and relatedness, which ‘predict psychological well-being in all cultures’, with no difference

for cultures valuing individualism and those valuing collectivism.³⁰²⁶ There is also evidence that a controlled regulation environment depletes energy and may affect vitality, and thus performance. Hence, options should be offered to users in a non-controlling way, if we are to preserve rather than undermine autonomy. Even if law and policy may only impact on one only dimension of the broader environment affecting an individual's autonomy, research in psychology may provide a lot of wisdom for the definition of possible theories of user/consumer harm in competition law, thus providing some relief from corporate conduct that reduces autonomy.

Self-determination and autonomy may be reduced by active manipulation by corporations of consumers' biases.³⁰²⁷ Manipulation may take a more industrial scale in digital markets. This has led to an emerging body of scholarship attempting to define manipulation in both offline and online contexts,³⁰²⁸ but also some concerns expressed by regulators³⁰²⁹. Calo expressed the problem of self-determination and autonomy of digital consumers as linked to the mediating role of technology, which enables some business actors 'to design every aspect of the interaction with the consumer.'³⁰³⁰ One may certainly envision manipulation as involving an intervention that changes the way someone behaves. Hence, but-for this intervention the person would have behaved differently. Susser et al note that intervention may, in abstract, take the following two forms: (i) change the 'decision space' of an individual, for instance by changing the options available to them, and (ii) change 'their internal decision-making process', in order words, 'the way they understand their options.'³⁰³¹

The difficulty consists in determining what distinguishes manipulation from other forms of intervention, such as simple influence or persuasion. The latter does not raise concerns with regard to self-determination and autonomy as it makes an appeal to the person's decision-making power. Spencer defines manipulation as 'an intentional attempt to influence a subject's behaviour by exploiting a bias or vulnerability.'³⁰³² The manipula-

tor targets the individual's capacity for self-government by acting on the person's extrinsic motivations in a way that deprives them of authorship, 'adjusting their psychological levers ... away from their ideal settings.'³⁰³³ The intent of the alleged manipulator is a factor emphasised by the literature.³⁰³⁴ Similarly, the hidden nature of the manipulative influence ensures that the manipulated person is unaware of this external regulation, thus excluding situations of introjected regulation from being considered as manipulation. Susser et al argue that 'at its core, manipulation is hidden influence – the covert subversion of another person's decision-making power' which functions by 'exploiting the manipulee's cognitive (or affective) weaknesses and vulnerabilities in order to steer his or her decision-making process towards the manipulator's ends.'³⁰³⁵ These may be cognitive biases, as explored in 10.2.5, or emotions and desires.

These authors also consider that deception does not constitute a necessary condition for manipulation, as there might be manipulation without deception. Similarly, nudging can be manipulative, but not all nudges are manipulative. Susser et al. Finally, coercion restricts acceptable options from which another person may choose, and constitutes a more direct intervention of external regulation of behaviour than manipulation. The same authors argue that the digital economy facilitates manipulation as it enables digital platforms to harvest and analyse personal data enabling them to identify more easily consumers' weaknesses and vulnerabilities: they can reach over various dimensions of human experience, and they are 'dynamic, interactive, intrusive' and set forth 'incisively personalizable choice architectures' that may steer consumer choice.³⁰³⁶ The subversion of the decision-making power of individuals through manipulation challenges their autonomy and self-determination, with harmful effects on their development and productivity. It also raises broader concerns if manipulation in consumer markets may be easily converted to power in the political sphere. Psychographic profiling identifying with increasing levels of accuracy personality traits becomes the new normal in the data economy, driving business practices and enabling targeted forms of advertising at the individual consumer level without any comparison, in terms of effectiveness, with regard to the tools of traditional advertising.

Prior to accepting the claims for manipulation lays a more fundamental debate, that of the nature of human consciousness. Phenomenology and Cartesian thinking insists on the distinction between the brain and the mind, carefully distinguishing an 'internal' from an 'external' world, dividing our phenom in three parts: '(i) experiences of the "external" world, such as sights, sounds, smells, slippery and scratchy feelings of head and cold, and of the positions of our limbs'; (ii) 'experiences of the purely "internal world",

such as fantasy images, the inner sights and sounds of daydreaming and talking to yourself, recollections, bright ideas, and sudden hunches'; and (iii) 'experiences of emotion or "affect"... ranging from bodily pains, tickles, and "sensations" of hunger and thirst, through intermediate emotional storms of anger, joy, hatred, embarrassment, lust, astonishment, to the least corporal visitations for pride, anxiety, regret, ironic detachment, rue, awe, icy calm'³⁰³⁷. This approach distinguishes between the brain where various of these stimuli are processed, and the 'self', the 'centre of narrative gravity', the latter being forming the 'core' of a person and the foundation of its autonomy. However, others have put forward a 'Multiple Drafts' model, where 'all varieties of perception – indeed all varieties of thought or mental activity – are accomplished in the brain by parallel, multitrack processes of interpretation and elaboration of sensory inputs', 'information entering the nervous system' being 'under continuous "editorial revision"'³⁰³⁸. These authors emphasise the development of streams of content that are subject to 'continual editing by many processes distributed around in the brain, and continuing indefinitely into the future', without there being a 'single narrative' (a 'final' or 'published' draft)³⁰³⁹, as understanding is a property that 'emerges from lots of distributed quasi-understanding in a large system'³⁰⁴⁰. 'Probing this stream at various intervals produces different effects, precipitating different narrative-and these are narratives'³⁰⁴¹. 'Any narrative... that does get precipitated provides a "time line", a subjective sequence of events from the point of view of an observer'³⁰⁴². This theory may raise interesting questions as to the definition of what constitutes 'manipulation', and in particular if such concept would be appropriate in the circumstances of the 'Multiple Drafts' model, and the different means through which it could be exercised. The approach and its empirical foundations have been subject to criticism and the conclusions reached may not hold³⁰⁴³, hence the need for more research and debate.

Defining the various parameters of the concept of manipulation affecting human consciousness is not the only challenge; it is also important to determine what would be the acceptable sources of evidence for manipulation and to design an appropriate test drawing not only on economics and behavioural economics but also psychology. This should be an important task for the future for competition authorities and academia.

11.4. Conclusion and Remedies

We are in favour of collective action to restore the conditions of a well-functioning data market. In the model we presented, in regime 2, we assumed that in the opt-out world there was significant competition so that the purchaser of personal information is forced

3037 D.C. Dennett, *Consciousness Explained* (Back Bay Books, 1991), 45.

3038 Ibid., 111.

3039 Ibid., 113.

3040 Ibid., 439.

3041 Ibid., 135.

3042 Ibid., 136.

3043 See, for instance, K. Akins, *Lost the Plot? Reconstructing Dennett's Multiple Drafts Theory of Consciousness*, (1996) 11(1) *Mind and Language* 1.

by competition to offer \$y, the full value of the personal information to the company. If such competition among purchasers of personal information were not present, and, for example, Google remained a monopsonist as in regime 3, the user would not be appreciably better off in the opt-out world rather than the opt-in world. So, a remedy cannot be just the change from opt-in to opt-out, but has to accomplish or at least imitate competition in the market for personal data sale.

A possible solution dealing with the risk that users are imposed conditions to which they did not provide they voluntary consent is that the 'default' regime be changed from 'opt-in' to 'opt-out.' Applying these principles to the case of social networks, one may argue that Facebook has no incentive to make this change on its own, and therefore this has to be achieved by regulation. This is certainly the choice made by the EU when adopting the GDPR, which put in place an 'opt out' regime. However, even if one changed to 'default opt-out', this will not have provided an adequate response, as the dominant social network may impose, because of its market dominance, the conditional use of the website to the 'consent' provided by the users of their data being harvested. Hence, an 'opt-out regime' will not be enough because of the asymmetrical bargaining power between the digital platforms enjoying a dominant position and the users.

One option may be to mandate that the digital platform offer the same product by asking for a fee, if data is not to be harvested and the users not being subject to targeted advertising. In cases in which the data of the specific user is quite valuable, it would be possible to require the digital platform to provide a positive payment to these users so that they can join the social network. Again this will raise several issues.

First, because of its dominant position Facebook may deny users 'free' access to its services if they opt to exercise their privacy rights, may overcharge users or not pay them the competitive price to join the social network or to buy their data. As discussed in 11.2.1., social networks of the size of Facebook have network effects and benefit from feedback loops. Strong network effects result in high market share inequality among networks, much higher profitability for large size network, barriers to entry for new networks, as well as providing the ability of a larger network to subsidize some 'influential' users to subscribe.

Second, another issue is, as mentioned in 11.2.4. the missing market that would enable users to evaluate the full cost and benefit of their transaction with Facebook. Once we understand the interaction between user and Facebook/Google as a *market* interaction we may fully grasp the possibility that the dominant position of the buyer of data (monopsony) may lead to inefficient exchanges, or that the monopsony buyer may have a lot of user-specific information and can implement sophisticated price discrimination strategies.

This calls for antitrust enforcement, in particular conduct as well as structural remedies, privacy regulation, but also other regulatory tools that would aim to set up a market between users and the network, ensure the transparency in the collection of data (so that users know what is collected), ensure transparency in the use of data (so that users

know how their data is used), and ensure user's consent in data collection and specific use eventually with a possible compensation to the user for 'selling' his data to a company like Google or Facebook.

Such regulation should also make 'opt-out' the default. If a user opts-out, Facebook or Google should not be able to use or sell the data the user discloses to Facebook/Google. Users may be compensated for opting-in, thus allowing Facebook/Google to use the user's raw data as well as his 'activities' and 'connections.' This default opt-out will create a *market* between the user and Facebook or Google, where the user sells his data to the digital platform. More concretely, with regard to Google, opt-out should be the default for browsers Android, and Google search. Users should have opt-out choice for other personal data, such as health data, even if this data was not acquired from the users. Users may also be able to easily set their browser to delete cookies and trackers at end of use/session and users should be able to avoid Chrome.

This opens the possibility for a possible compensation to the user for 'opting-in' that is, for 'selling' his data to a company like Google or Facebook. Depending on the extent that a user opts-in, he may be compensated in different amounts for allowing

- Collection ("opt-in") of his personal data directly from the company he interacts with (say Google);
- Use of his data for a specific purpose by Google (say for marketing vs political campaigns);
- Sale of data to third parties by Google.

The EU takes a different perspective as pricing remains unaffected by the opt-in/opt-out decision.

Pricing the data should nevertheless avoid the pitfall of letting the monopolist/dominant digital platform use its superior bargaining power vis-à-vis individual users to ask for the monopsony price (in terms of data harvesting). This raises the question of identifying the but-for the infringement world, in order to determine the competitive monetary value of the data and thus ensure the proper payment of the users (if positive prices are charged), or the amount the users should be asked to pay (in data value or monetary prices) in order to have access to the product. In building this counterfactual the decision-maker should take into account the situation prior to the competition law infringement (before-and-after test) and/or the situation at a comparable in terms of relevant characteristics geographic market which is nevertheless significantly more competitive than the market under examination.

Several other remedial options exist in order to restrict the privacy-harming potential of digital platforms with market power. It might be possible to break up the platforms horizontally by introducing in the market several horizontal competitors. However, there is a relatively low effectiveness for this remedy in view of the 'winner takes most competition' effect in markets with intensive network effects. Even if there are new entrants in this market, the resulting market structure may not be significantly different and competi-

tion will be for the market rather than competition in the market. A vertical separation of the platform from the merchants, by prohibiting them to expand in vertically related markets may also provide some temporary relief, but may also slip to some form of regulation, a hybrid between utilities' regulation and data protection/privacy regulation.

Platforms may opt to pay for the users' data thus leading to the emergence of a licensing market for user data for users opting-in to share their data with the platforms. At the same time this enables the users to port this data to platforms offering them a higher return and better conditions in terms of higher value for their privacy.

Exclusive licencing of personal data to a company will imply a monopsony and will not solve the problem of competition in the personal data market. We could institute non-exclusive licensing through a licensing agency that would collect the data from each user and distribute it to platforms. The user would be paid the sum of the willingnesses to pay of all the company bidders. What determines how much a user gets paid or pays? Assuming similar competing networks, a user would like a larger network because there are more possibilities of interaction, and therefore his willingness to pay $\$x$ increases in the size of the network. If we assume that the influence of a user is on a finite number of friends, a smaller network would be willing to pay more to add him, so $\$y$ does not increase with network size, for networks above a moderate size. Additionally, a dominant network will be able, in general, to pay users less and/or demand higher payments from users, because of the use of its market power, and of the information about the features of the users. So, we expect that most users will pay more to subscribe in a large and dominant network and be paid less by it. In order to determine what will constitute a 'fair' value one will need to refer to the value in a competitive market. However, this is not possible in the specific case as there is no perfectly competitive market and there cannot be one because of network effects. Digital platforms may exercise their buying power leading to a downward pricing pressure in the market for personal data for input suppliers (the users) and therefore deprive them from a portion of their revenues. Because of the buying power of digital platforms (or the monopsony they may benefit from) and the fact that this sorry situation results from the initial requirement contracts bundling digital services with personal data competition law should grant to the users a legitimate interest in prices which shall not be 'artificially' low. In some jurisdictions, low pricing may be found to be unfair pricing and therefore infringe the abuse of dominance provisions³⁰⁴⁴.

3044 Unfairly low prices may also be a concern for the application of Article 102(a) TFEU. This does not concern predatory prices, but situations in which a dominant buyer purchases inputs at unfairly low prices. These are determined according to a comparison between the price paid and the economic value of the service provided. In *CICCE*, the CJEU examined an action for annulment against a decision of the Commission relating to conduct by some French television stations holding exclusive broadcasting rights to pay low license fees for the rights of films and accepted that article 102(a) could apply in these circumstances, although in this case the Commission had not found an abuse, as it was impossible, in view of the variety of the films and the different criteria for assessing their value, to determine an administrable yardstick valid for all firms, since each film is different: *Case C-298/83 Comité des industries cinématographiques des Communautés européennes v Commission* [1985] ECR 1105. This type of theory of harm is more difficult to implement in the US, where since the *Weyerhaeuser* case of the Supreme Court in view of the high standards required for a successful claim of predatory bidding (the SCOTUS stipulating that the Brooke Group predatory pricing analysis applies

A possible solution to this problem is for NCAs to facilitate the users to collectively bargain with the platforms rates for the payment they will receive for the data harvested in order to protect their personal data.³⁰⁴⁵ The value of personal data and therefore the price to which these may be sold to digital platforms may also increase by some input limitations by a digital and/or data protection regulator as to the amount of data to be harvested or collective bargaining between the users and the digital platforms, eventually through the constitution of collecting societies by the users that would also bargain with the digital platforms.

Additional remedies that may address the problem of the lack of a market for personal data is data portability providing users the ability to export their social graph or their search history. This remedy is examined in more depth in Chapter 5.

Interoperability remedies may also intensify inter-platform competition. For instance, Facebook should change from a closed to an open communication network enabling its users to also send messages to users of other social networks. This would require the adoption of an open API for user messages, chats, posts, and other communications.

Finally, it is important to add the existence of technological solutions to the problem of restrictions to privacy by the business conduct of digital platforms or more generally user-initiated and driven practices that may frustrate the aims of the adds-based business model, such as adding Adblocks³⁰⁴⁶ and the development of tracking protection technologies³⁰⁴⁷. For instance, NCAs may mandate the development of a unique 'Do not track' switch that may apply for all networks and prohibit or even bring abuse of dominance cases for exploitation against Facebook or Google if they try to bypass these technologies or forbid their use in their platforms³⁰⁴⁸.

equally to the predatory pricing of outputs and predatory bidding for inputs). Since this case, however, the US antitrust authorities, and more generally the US antitrust community, have shown more openness of mind for such claims and in particular shown concern for monopsony power in antitrust and merger control (in specific sectors, such as agriculture, but also beyond). See, J. Shively, When Does Buyer Power Become Monopsony Pricing?, (2012) 27(1) Antitrust 87; C.S. Hemphil & N.L. Rose, Mergers that Harm Sellers, (2018) 127 The Yale Law Journal 2078.

Chapter 12: Country Report – Brazil

**Caio Mario da Silva Pereira Neto, Paulo Furquim de Azevedo, Murilo Lubambo de Melo
& Bruno Polonio Renzetti**

12.1. Introduction

The digital industry has been flourishing in Brazil. In several dimensions, such as internet access, consumers' internet usage, and the supply of digital services, Brazil presents high growth rates. Its growth pattern though reflects the profound income and educational inequalities that characterises the country, with considerable variability on those indicators across social groups. This chapter presents some basic features of the digital industry in Brazil and how it is regulated. Moreover, it assesses whether regulatory and competition authorities treat the digital industry differently from the conventional industries, due to its technological dynamics.

This chapter is structured in three sections, including this introduction. Section 2 presents basic information on industry features in Brazil, such as internet access, industry structure, and consumer behaviour. The institutional framework for the digital economy is then presented in Section 3, which emphasizes the regulation of digital services and the interface between regulation and competition policy in this industry. The conclusion with a brief summary of the main distinctive features of the Brazilian experience is presented in Section 4.

12.2. Industry and technological background

in order to fully understand the main findings regarding competition law and the digital economy, it is first necessary to introduce the current status of industrial and technological infrastructure in Brazil and how it has evolved throughout the years.

This section provides information on the infrastructure necessary to foster development of digital economy in the country. First, it shows that almost 70% of the Brazilian population has access to Internet and the level of access is directly proportional to high levels of education and income. The availability of internet networks is also examined.

Section 2 also looks at questions regarding Smart Cities and Internet of Things, reporting the current regulatory framework in Brazil and the initiatives that are already taking place in order to turn some municipalities into smart cities. The section concludes with a brief view on the role of social networks, the evolution of e-commerce, the affordability of networks in Brazil, and the market structure (i.e. concentration levels) in different digital segments.

12.2.1 Internet access penetration levels in Brazil

According to the latest survey conducted by the Brazilian Bureau of Statistics (in Portuguese, *Instituto Brasileiro de Geografia e Estatística*, "IBGE")³⁰⁴⁹, 75% of the households in Brazil have some access to internet, either through mobile phones or fixed broadband. By the end of 2017, the country had peaked at 126.4 million Internet users, representing 69.8% of the total population. Additionally, 97% of the users accessed internet through their smartphones. The mobile phone has largely surpassed the personal computer as the main point of internet access.

The same source provides different breakdowns about the profile of internet access, synthesized in the tables 1 to 7 below. The general pattern shows higher penetration levels of internet access in the Midwest, Southeastern and Southern regions of Brazil, which are also the wealthiest in the country. As expected, regions with lower population density, such as North and Midwest, have a higher proportion of mobile broadband in comparison to fixed broadband.

Also predictable, higher levels of access are concentrated in the young, urban and more educated groups of the population. It is also notable a slight convergence among age groups as the access is increasing faster in groups with lower access levels. There is no significant gender bias, but women are slightly more connected than men.

Table 1 – Internet Access per Device

Device for Internet Access	2016 (%)	2017 (%)
Mobile Phone	94.6	97

Figure 1 -Access according to income levels (MW = Minimum Wage)

Source: TIC Domicílios 2017.

Figure 1 shows that income is highly correlated with internet access. Among the richest households (more than 10 minimum wages per family; which is about US\$ 2,500 per month), almost all have internet access, whereas little more than half of the poorest are connected to the internet. Still, it is impressive that most individuals with income of up to 1 minimum wage (roughly USD 250) – i.e. living under 10 dollars a day – have some type of internet access. This information highlights how important connectivity has become in the Brazilian society.

One important quality dimension of internet access is the effective speed that users may enjoy. According to the Speedtest report, most cities in Brazil have an average effective speed higher than 10Mbps and 100% have average effective speed higher than 2Mbps (the minimum required speed to watch streaming videos). Still, Brazil is only the 63rd country in fixed broadband speed and the 79th in mobile, behind China (28th in fixed broadband and 44th in mobile) and ahead of India (74th and 126th, respectively). Brazil is more comparable to the other two BRICS. In fixed broadband, Russia ranks 47th in fixed broadband speed and 96th in mobile, whereas South Africa ranks only the 84th in fixed broadband speed, but 67th in mobile³⁰⁵⁰.

Overall, the data above show a high and increasing level of connectivity, with some relevant disparities across regions and income levels. Broader penetration is also associated to lower prices for data access. Although prices per Mbps remain high, they have decreased in the last seven years³⁰⁵¹. The inequality of connectivity along these lines reflects the broader inequality levels of Brazilian society and is not particular to internet usage. The Regional Plans for Development for the North and Northeast may be important instruments to tackle digital inequality, through development-targeted action plans with legal status, focussed on digital inclusion.³⁰⁵²

Availability of Internet Networks: institutional background

The Brazilian telecommunications sector experienced major regulatory changes in the end of the 1990s. Before such changes, the sector was fully operated by state-owned enterprises (SOE), under the umbrella of Telebrás, a holding company controlled by the Federal Government. Telebrás owned several subsidiaries and was responsible for the provision of more than 90% of the telecommunications services in the country. The scenario completely changed once the General Telecommunications Law (Law n. 9.472/1997) was enacted, establishing the new regulatory framework from Brazilian telecom sector.

The same law created the National Agency for Telecommunications (in Portuguese, *Agência Nacional de Telecomunicações* – “ANATEL”), which functions as sectorial regulator. As an independent regulatory agency, ANATEL rapidly rolled out a package of regulations opening the way for privatization of the Telebrás System in 1998. Since

3050 Data available at <https://www.speedtest.net/global-index>.

3051 Available at <https://exame.abril.com.br/tecnologia/preco-medio-da-velocidade-na-banda-larga-fixaiu-83-entre-2010-e-2018/>

3052 See e.g. Northeast Regional Development Plan <http://www.sudene.gov.br/prdne/documento> p 61-63.

then, the vast majority of the Brazilian telecommunications system has been privately owned, with very few exceptions (e.g. Telebrás was recreated in 2010, with a limited role, and Sercomtel, a small SOE controlled by the municipality of Londrina, in the state of Paraná)³⁰⁵³. The new regulatory framework for telecommunications, together with privatization, were the cornerstones for expansion of internet connectivity, through mobile and fixed broadband, in the early 2000s.

During the privatization process, state-owned Telebrás was split in twelve different holding companies for the bidding: eight companies³⁰⁵⁴ were responsible for mobile telephony and four landline companies³⁰⁵⁵. The bidding for the four landline companies imposed the obligation to meet universal access in the region serviced by the acquired operator – in practice, this meant providing services in the poorest areas of the country and villages in the countryside, far from the large centres.

According to the General Telecommunications Law, the provision of landline service is considered a ‘public service’, with universal access targets and more stringent regulation, including rate regulation of basic access. In this sense, landline incumbents (i.e. public service providers) are treated as utilities that need to fulfil public goals. Although internet access has never been defined as a ‘public service’ (it is considered a service under the ‘private law regime’, with more flexible regulation), some of the universal access obligations imposed on landline incumbents (e.g. expansion of backhaul access) has given support to internet connectivity.

The universal access obligations are always included in the General Plan of Universalization Goals (in Portuguese, *Plano Geral de Metas de Universalização* or “PGMU”). The first PGMU was released in 1998, before the privatization of Telebrás, in order to allow private groups to know beforehand what would be the required targets. The Plan sought to rapidly expand access to landlines to locations around the country. It expanded the number of landlines available from roughly 20 million in the end of the 90s to 40 million lines in 2003. This expansion helped to bridge the gap of access to a latent demand. However, because the targets were set in relation to availability of lines, and not lines in use, universal access in fixed telephony was never reached, and the affordability gap, coupled with the take-off of mobile networks, led to millions of idle landlines³⁰⁵⁶.

3053 Sercomtel offers its services in 198 municipalities in the state of Paraná, either through its own infrastructure or through a partnership with COPEL, the Paraná’s SOE for electricity.

3054 The eight mobile companies were Telesp Celular, Tele Sudeste Celular, Telemig Celular, Tele Celular Sul, TeleNordeste Celular, Tele Centro-Oeste Celular, Tele Leste Celular and Tele Norte Celular.

3055 For the bidding process, the country was divided in three regions, each one assigned to a different company: Tele Centro-Sul (for the Midwestern and Southern Brazil), Tele Norte-Leste (for the Northern and Eastern Brazil) and Telesp (dedicated exclusively to the state of São Paulo). The fourth company was Embratel, responsible for long-distance service.

3056 For a detailed discussion of the successes and pitfalls of these early rounds of universal access, see PEREIRA NETO, Caio Mario da Silva. *Universal Access to Telecommunications in Developing Countries: the Brazilian Case*. Yale Law School, 2005. Also, for an in-depth study of the universal access policies in Brazil and its developments fifteen years after the General Telecommunications Law, please see PEREIRA NETO, Caio Mario da Silva; ADAMI, Mateus Piva. *O desafio da universalização de telecomunicações: um balanço após 15 anos de LGT*. In. GUERRA, Sergio. *Regulação no Brasil: uma visão multidisciplinar*. Ed. FGV: Rio de Janeiro, 2013.

The actual universalization of voice telephony came with intense competition among mobile operators after privatization. With rapid expansion, mobile networks quickly surpassed fixed switched networks many folds. Today, as in many other countries, Brazil watches a slow decline in landlines and stabilization in the number of active mobile lines, which has reached a vast majority of the population. Brazil is currently in the fourth edition of PGMU and the focus has now changed to make broadband access available to all, a major challenge in a country of continental dimensions and deep inequality. The current PGMU is focused on expanding backhaul infrastructure and mobile LTE in small cities.

In 2010, the Federal Government launched the National Broadband Program (in Portuguese, *Plano Nacional de Banda Larga* or “PNBL”)³⁰⁵⁷. In order to achieve the goals of 40 million households with Internet access by 2014, the Federal Government recreated Telebrás, which became responsible for operating the backbone for the PNBL. Due to numerous reasons, including the failure of Telebrás of performing as expected³⁰⁵⁸, the PNBL was discontinued at the end of 2016 and was not able to achieve its central goals regarding expansion of broadband³⁰⁵⁹.

A more recent development regarding the availability of networks was Decree n. 1.602/2017. The decree establishes the “Connected Education” program, which seeks to provide broadband access to public schools. The goals of the program are to be reached by 2024. Most of the resources invested by the Federal Government intend to improve infrastructure, creating the necessary means to make broadband internet access available especially in rural areas.

12.2.2. Digital Economy Growth: smart cities, Internet of Things, and the corporate finance for the digital economy.

There are some key developments in the digital economy that both require a minimum level of infrastructure and internet penetration and, also, reinforce the digital economy growth. This is the case of smart cities and the Internet of Things, which involve a network of overlapping initiatives. To fuel this process of development it is also necessary to untie the problem of corporate finance, which also requires coordination among investors. This section presents some basic features of these key-developments for the digital economy in Brazil.

Smart Cities

A Smart City is “a city seeking to address public issues via ICT-based solutions on the

3057 Decree 7.175/2010.

3058 For a critic analysis of the PNBL, please see ALIMONTI, Veridiana. O Programa Nacional de Banda Larga e o Banda Larga para Todos: a perspectiva da sociedade civil. In. KNIGHT, Peter et al. Banda Larga no Brasil: passado, presente e futuro. São Paulo: Figurati, 2016

3059 <http://teletime.com.br/28/06/2017/pnbl-chega-ao-fim-sem-atender-as-regioes-mais-necessitadas/>

basis of a multi-stakeholder, municipally based partnership”.³⁰⁶⁰ In this sense, Brazilian cities are slowly undergoing the process of becoming “smart”. There are, however, some municipalities that have successfully started the transition to spend its resources more intelligently, providing for a friendlier urban space. Cities such as Curitiba, São Paulo, Belo Horizonte and Vitória are examples of Brazilian cities that have achieved the title of Smart City due to their initiatives.

One of the most relevant tools for Brazilian cities to become “smart” is the Internet of Things – IoT. Brazilian municipalities have great challenges that could be solved with the help of IoT: mobility, public security, energy and sanitation, innovation, urbanism and housing, health, education, governance, institutions and economic activity.

All of the above examples are present in the study *“Internet of Things: an action plan for Brazil”*, developed by the consortium McKinsey/Fundação CPqD/Pereira Neto | Macedo, which was used as a key input for the National Plan of Internet of Things. The consortium released its final report in January 2018. Besides providing a substantive overview of the IoT field in Brazil, it also focused on specific sectors³⁰⁶¹. In Brazil, one of the most relevant projects for Smart Cities is related to street lighting. The use of smart grids provides for a more efficient management not only of the energetic source, but also of utilities and functionalities connected to the energy network, such as consumption measurement, monitoring and telecommunications. Moreover, smart grids help to develop a more sustainable distribution network.

One of the first municipalities to have “smart” street lightings, the city of Caraguatatuba, in the state of São Paulo, changed all its street lamps to new lamps prepared to receive the smart grid, allowing the Mayor’s Office to receive up-to-date information through smartphones. Additionally, Belo Horizonte, the capital of the state of Minas Gerais, is also switching to smart street lighting, saving up to 45% of energy due to its remote management, allowing for more control of the lights: the intensity of a lamp will be adjusted remotely, for instance. The system also provides for a better exchange of information with other equipment, such as traffic lights and CCTV³⁰⁶².

It is important to notice that the experiences from Caraguatatuba and Belo Horizonte were implemented through a PPP – Public Private Partnership. The PPP can be an effective tool to help municipalities with lower revenues and greater risk allocation to the private party, becoming responsible for the maintenance of the infrastructure³⁰⁶³.

The Brazilian Experience with Internet of Things

Despite its opportunity to foster and increase innovative entrepreneurship in Brazil, creating new markets and contributing to productivity and efficiency, the environment for Internet of Things in Brazil has not yet been developed to its full potential. This scenario started to undergo significant changes in 2016, when the National Bank for Economic and Social Development (“BNDES”) and the Ministry of Science, Technology, Innovations and Communications (“MCTIC”) signed an agreement to produce the National Plan for Internet of Things in Brazil, identifying actions to be taken in order to promote IoT in the country as model of development in several economic sectors.

As referred to above, the National Plan started with a deep study entitled *“Internet of Things: an action plan for Brazil”*³⁰⁶⁴ (Study). The study was divided in four different stages, each of them with specific goals: (i) diagnosis and aspiration for Brazil; (ii) selection of vertical (i.e. focused on specific industries and/or applications) and horizontal (i.e. across industries) strategies; (iii) research of most promising vertical strategies and preparation of a Vision and Plan; and (iv) implementation support of the Action Plan.

The study also suggested relevant changes in the regulatory framework, in order to foster the development and implementation of IoT in Brazil, with most of the suggestions related to the telecommunications framework. The greatest drawback in this aspect is the lack of wide connectivity, due to the availability of infrastructure in the country. To better use the available infrastructure, the telecom regulation should be reviewed in order to foster investments for its expansion. Moreover, it is important to map the use of licensed spectrum, aiming at verifying whether it is being rationally used and if its model is the best suited for IoT development.

The regulatory bureaucracy is another relevant obstacle for the development of Brazil's full potential in IoT. As pointed out in the Study, identified that the process of certification and accreditation of IoT devices carried out by the National Telecommunications Agency (“ANATEL”) is one of the most relevant regulatory barriers³⁰⁶⁵. There are two main problems related to it: first, it is a long, complex and time-consuming process; second, there are no international cooperation agreements that would waive the certification process if it had already happened in order countries. Streamlining this process is essential to allow faster adoption of IoT solutions.

On its turn, the questions related to the licensed spectrum tackle issues related to the necessary infrastructure in order to create a friendly environment for IoT development. The radiofrequency spectrum is a scarce resource and its use must be done in the most rational manner available. It is especially important for the development of IoT because most devices are mobile and must transfer its data through a specific frequency. Some changes seem particularly important on this area. First, the creation of a secondary market for radiofrequency use, allowing a better allocation of this resource and avoiding underutilization. This could also be implemented through business agreements known

3064 See n 13, supra.

3065 Id.

as “ran sharing” and “spectrum swap”, where operators share the use of spectrum. Second, the vast majority of IoT devices do not employ the same data networks commonly used by telecommunications (such as GPRS/EDGE and 3G/4G/5G), because it transfers smaller amounts of data. In this sense, the use of non-licensed spectrum, through Low Power Wide Areas Networks, could contribute to IoT’s expansion in Brazil.

The most recent development regarding IoT in Brazil was the enactment of Decree n. 9.854, of 25 June 2019. The Decree, which was partially inspired in the above-mentioned study, establishes the National Plan for Internet of Things³⁰⁶⁶ and creates the Chamber of Management and Monitoring of the Development of Communication Systems Machine-to-Machine and Internet of Things (“IoT Chamber”). The IoT Chamber is responsible for monitoring and evaluating initiatives, promoting and fostering partnerships between public and private entities, supporting and proposing projects, discussing with the public bodies and entities the themes of the action plan and jointly act to stimulate the use and development of IoT solutions.

The Decree is fairly broad and lacks a concrete roadmap for actions to be taken, but it represents a first step towards a more consistent development of IoT solutions in Brazil, also establishing a governance structure to deal with the challenge. The actual effectiveness of the Plan will largely depend on the capacity of such governance structure to coordinate both public and private actions needed to unleash the full potential of the IoT environment.

Despite the above policies, the Internet of Things, similarly to what was observed for smart cities, is still incipient in Brazil. Whereas the level of connectivity is increasing fast and already relatively high, both smart cities and the Internet of Things are a step behind. This imbalance suggests that individual demand for connectivity has been a major driver for internet use, since indicators more associated to market provision, such as individual access to the internet, perform better than those that require a higher degree of public coordination, such as smart cities.

Corporate Finance

There is no comprehensive data on the corporate finance for the digital industry in Brazil. Anecdotal evidence suggests that the major funding source for digital companies comes from venture capital and equity investment from larger economic groups, domestic or multinational. The case of 99, a ride-hailing company founded in Brazil, illustrates this point. The company first received venture capital from Brazilian groups, an amount enough for the company to reach the critical mass for the taxi hailing service. Later, when 99 entered the private ride-hailing market, competing directly with Uber, the company received a substantial investment from the Chinese Group Didi, which in a

3066 Internet of Things is defined as follows in the Decree: “The infrastructure that integrates the provision of value-added services with physical or virtual connection capabilities of things with devices based on existing information and communication technologies and their evolution, with interoperability.” (Art. 2, I). The governance structure of the Brazilian Strategy to Digital Transformation had been created by Decree n 9.319, of 21 March 2018.

couple of years acquired the control of 99. A similar pattern is observed in other sectors, such as fintechs or e-commerce.

12.2.3. How many consumers are actively engaging in e-commerce?

According to the IBGE survey (TIC Domicílios), in 2017, 35% of Brazilian internet users had engaged in e-commerce, acquiring products or contracting services through the internet in the last 12 months.

The 38th Edition of the Webshoppers Report³⁰⁶⁷, conducted by Ebit/Nielsen, also revealed interesting data regarding e-commerce in the country. For instance, the report shows that 68% of the e-commerce transactions happen through PCs, whereas 32% were concluded via mobile devices. The sales by mobile devices grew 30% in 2018 when compared to 2017, totalling 17.4 million transactions, a trend consistent with the increasing importance of mobile access to the internet, as presented in Table 1. However, these data also suggest that consumers still use comparatively more PC access for e-commerce (68% of transactions for 56% of PC access versus 32% of transactions for 97% of mobile access).

During the first semester of 2018, Brazil registered 27.4 million active consumers of e-commerce, which represents a 7.6% growth when compared to the same period of 2017. The average age of the Brazilian individual engaged in e-commerce is 43 years old and 51.5% of the consumers are female. In addition, Brazilian individuals spend 433 BRL (roughly 115 USD according to the exchange rate of February 2019) on average for each e-commerce transaction.

The beauty and health sectors are those with the largest volume of e-commerce transactions, summing up to 15% of all transactions in Brazil, closely followed by Fashion and Home Décor. When it comes to the value of the transactions, the purchase of telecom services and mobile phones represent almost 19% of all the Brazilian revenue originated from e-commerce. Home appliances come in close second.

A special note must be made to the tourism sector of e-commerce. In 2017, the revenue of e-commerce focused on tourism, including the online travel agencies (OTAs), reached BRL 35.1 billion (over USD 9 billion according to the exchange rate of February 2019), growing 17.8% in comparison to 2016.

12.2.4. Engagement with social networks

According to the report *Digital in 2016*, produced by We Are Social and Hootsuite³⁰⁶⁸, Brazil had 103 million active social media users in 2016, being it 88 million active mobile social users. In comparison to the country's population at the time, the number of active social media users represented 49% of the population. The same report produced in

3067 Available at: < <https://pt.slideshare.net/LucasModesto6/webshoppers-37-2018> >

3068 Available at: < <https://www.slideshare.net/wearesocialsg/2016-digital-yearbook> >

2017³⁰⁶⁹ showed that Brazil had 122 million active social media users, with 110 million active mobile social users. On the 2018 report³⁰⁷⁰, the number of active social media users increased to 130 million, with 120 million active mobile social users. The penetration rate of social media in the country peaked at 62% of the population. Thus, from 2016 to 2018, active social media users experienced an average annual growth rate of 12.9%, whereas mobile social media users experienced an annual increase of 16.8%, even in an economy deeply under recession.

Another revealing information on the report was that the number of mobile subscriptions surpassed the country's population, totalling 237.7 million subscriptions, in comparison to a total population of 210.1 million people in Brazil. However, as the IBGE data shown above illustrates, there are still relevant gaps of access, mostly in the North and Northeast regions of Brazil and in the low-income segments of the population.

Figure 2

Source: Digital in 2018

Facebook and WhatsApp are by far the most important social media, followed by Instagram, and then Twitter well behind the other three (Table 8, below).

Table 8. Number of users of selected social networks in Brazil (January 2019)

Social Network	Users
Facebook	130 million
WhatsApp	120 million
Instagram	69 million
Twitter	8.57 million

Source: Statista.com

One should note that the three largest social media, in number of users, belong to the

3069 Available at: <<https://wearesocial.com/special-reports/digital-in-2017-global-overview>>

3070 Available at: <<https://wearesocial.com/blog/2018/01/global-digital-report-2018>>

Facebook Group. One should also be careful to not associate this position to a virtual monopoly position, inasmuch as the delimitation of the relevant market here is far from trivial. It is plausible to adopt narrower definitions, as was the case of the European Commission analysis of Facebook merger cases, for which the four social media listed below were in different relevant markets; or broader definitions, such as the market for attention and advertisement, which could indeed even encompass a much broader number of platforms.

12.2.5. Affordability of connectivity

As outlined above, Brazil underwent significant changes in its connectivity environment, rapidly expanding internet access through different types of technologies, especially mobile networks (LTE). Nonetheless, there is still a relevant portion of the country and of the population with limited access. According to the TIC Domicílios survey conducted in 2017, the high prices for internet access ranked as the main reason for lack of connectivity, according to responses given by 59% of the households interviewed. The survey also pointed out that due to the high prices, some users shared wireless access with its neighbours in order to reduce the burden of internet on the family budget.

It is relevant to point out the differences between affordability of access to networks in urban and rural areas. The lack of infrastructure is listed as the key reason for absence of internet access by 29% of the rural households, in comparison with 18% of urban households. Most of the internet access in rural areas is done through mobile connections: this is the main connection for 37% of the households in the rural areas, whereas in urban areas this number totals 25%³⁰⁷¹. Regional disparities exacerbate this scenario: the less connected municipalities in Brazil are in predominantly rural areas of the North and Northeast regions.³⁰⁷²

In the survey PNAD Contínua of 2017, a household official research conducted by IBGE, the unavailability of internet access services was listed by 21.3% of the rural population as the main reason for not accessing the internet. On the other hand, the same number in urban areas was of only 1.2%.

12.2.6. Industry structure: concentration levels in your jurisdiction (if available) for: (a) internet access providers; (b) search engines; (c) search networks; (d) online advertising; (e) cloud computing.

In Brazil, there are three large private providers of fixed broadband internet access: Claro, Vivo and Oi. Table 9 below lists their market shares. The last item in the table – “Competitive SCM Providers” – accounts for the market share of the remaining providers of broadband internet, excluding the three market leaders.

3071 <https://www.nic.br/noticia/na-midia/campo-conectado/>

3072 <https://www.cps.fgv.br/cps/telefonica/>

Table 9 – Market Shares for Broadband Providers (January/19)

Company	Share (%)
Claro (+Blue)	30,0
Vivo (+GVT)	24,2
Oi	19,0
Competitive SCM Providers	26,8

Source: Teleco.com.br

The market leaders – Claro, Vivo and Oi – employ different technologies for their broadband services. While Claro has most of its connections by cable modem, Vivo and Oi rely heavily on xDSL (Digital Subscriber Line), and more recent investments in fibre (especially from Vivo). Table 10 summarizes the technology employed by each of the market leaders and their respective number of access.

**Table 10 – Number of Accesses through Broadband Providers (June 2019)
(thousands)**

Company	xDSL	Cable Modem	Fiber	Spread Spectrum	Ethernet	LTE	Other
Claro	78	9.245	161	1	0	0	46
Vivo	5.098	0	2.170	0	0	0	118
Oi	5.023	0	597	0	96	0	39

Source: Teleco.com.br

There is a larger concentration of providers in mobile internet access, with four main players and an insignificant fringe (Table 11). Competition pressure, though, is higher in mobile since those providers overlap in several areas.

Table 11 – Market Share for Mobile Internet Access

Company	Share (%)	Mobile Phones (Millions)
Vivo	30,06	55.474
Claro	26,38	48.698
TIM	24,98	46.115
Oi	16,11	29.729
<i>Fringe</i>	2,47	4.555

According to StatCounter.com, Google was by far the most important player in the search engine market in Brazil as of January 2019 (Table 12).

Table 12

Search Engine	Market Share (%)
Google	97.68
Bing	1.11
Yahoo	1.07
DuckDuckGo	0.08

Source: StatCounter.com

As for e-commerce, the ten largest e-commerce companies in Brazil account for 62.7% of the e-commerce market. The market leader for e-commerce in Brazil is B2W Digital, a company that owns many online marketplaces. B2W Digital had a turnover of BRL 8.044 billion in 2018 (around USD 2.16 billion) and 100% of its sales originated from e-commerce. As in 2018 online sales reached BRL 53.2 billion (around USD 14 billion), it is estimated that B2W was responsible for 15% of the online Brazilian market.³⁰⁷³ Table 13 below lists the Top 10 e-commerce companies in Brazil:

Table 13 – TOP 10 E-COMMERCE COMPANIES IN BRAZIL (2017)³⁰⁷⁴

COMPANY	% OF E-COMMERCE SALES IN TOTAL SALES (2017)
B2W Digital	100%
Via Varejo	16,7%
Magazine Luiza	30,4%
Walmart Brasil	10,6%
Grupo Netshoes	100%
Máquina de Vendas	38%
Carrefour	3,5%
GFG LatAm – Dafiti	100%
Saraiva	37,6%
Privalia	100%

12.3. Institutional framework for the digital economy in Brazil

the third section of this country report tackles the issues related to the institutional framework for development of digital economy in Brazil. The first item (3.1) explores the consumer protection structure in the country, especially looking at questions related to e-commerce and how the Consumer's defence Code may be applied in such cases. The following item (3.2) delves into questions related to the subjects of property rights protection in Brazil. After that, the report explores issues related to privacy and data protection regulation, especially considering the newly enacted General Data Protection Law (item 3.3).

The fourth section (3.4) and final item of the chapter is segmented in several different topics. It covers a range of institutional and enforcement issues, including the role of regulators and competition authorities. Concerning competition aspects, the topic covers some of the most relevant cases of digital economy scrutinised by the competition authority. There are also brief comments regarding the role of courts in enforcing competition law and regulations.

12.3.1. Digital consumer protection framework

The main legal statute that regulates and protects the consumer relations is Law n. 8.078/1990, which enacted the Consumer's Defence Code (CDC). Even though the code was written in the beginning of the 1990s, when e-commerce was not disseminated, the Code has been the subject of many new interpretations by the courts and amendments by the Congress, slowly adapting it to the context of e-commerce and digital consumption more generally.

First of all, article 6 of the CDC establishes the economic vulnerability of the consumer in contrast with the supplier of the goods or service. The consumer is then subject of a very specific protection in the Brazilian legal environment, which includes substantive protections (e.g. protections against false advertisement and abusive contractual clauses) and procedural protections (e.g. shifting the burden of proof to suppliers in legal disputes under the CDC).

The Brazilian courts have extended the effects of the CDC from physical sales to e-commerce transactions, with minor adaptations. As another example of consumer protection, especially applicable to the context of e-commerce, article 49 of the CDC grants the consumer 7 days to exercise its prerogative to change her mind and exit any transaction that takes place outside a physical store. In practice, it means that any e-commerce transaction may be reverted within this period, with no penalty.

The framework for protection of the digital consumer underwent meaningful changes in 2013, with the enactment of Federal Decree n. 7.962 by former President, Ms. Dilma Rousseff. The decree intended to update much of the CDC to the new reality posed by e-commerce. The digital consumer rights are now better expressed and the penalties to which the e-commerce companies are subjected for infringement of such rights.

A relevant case regarding consumer protection and digital platforms was ruled in 2014, by the Superior Tribunal de Justiça (STJ)³⁰⁷⁵. The case regarded the “credit scoring” practice conducted by credit bureaux in order to evaluate the history of payments of a given individual. If an individual paid his or her debts in a timely manner, the credit score would go higher, allowing for easier loans and better credit conditions. The issue addressed by the court related to the form in which the personal data was handled by the credit bureaux. According to the CDC, every collection of data from customers must be preceded by an express authorization of the data subject. The credit bureaux argued that the practice of credit scoring did not configure a new collection of data, but instead was only a methodology to process the data and evaluate risk from information already available and, thus, such consent would not be necessary.

Ultimately, the Court decided that such a methodology was legal and dismissed the requirement of a new consent by the data subject. Nonetheless, the Court also decided that the credit bureaux must comply with additional obligations set forth by the CDC and by Law n.12.414/2011. In this aspect, the bureaux must grant the consumers access to the information used to calculate their credit scoring³⁰⁷⁶. According to the Court’s opinion, such access enables the consumer to control the truthfulness of the information and to correct any misleading or outdated information that could negatively affect the score.

In brief, the Court ruled that the personal data must receive a transparent treatment and be handled with good faith at all times. If the bureaux do not respect any of the boundaries, the consumer could possibly be entitled to compensation³⁰⁷⁷.

In the antitrust field, CADE has also expressed its opinion regarding personal data and the limited role of competition authorities on such matters in at least two different opportunities.

The first opportunity was the association between TNL CPS S.A. and Phorm Veiculação de Publicidade. The association would enable Phorm to gather data from Oi’s users and then release targeted advertisements to selected users, based on their preferences. On this matter, CADE had an extensive opinion regarding privacy and internet and ultimately decided that it was not within CADE’s jurisdiction to address discussions regarding privacy. The association was approved without restrictions, and the evaluation of privacy concerns was sent to the Department of Consumer Protection and defence

3075 Docket n. 1.419.697/RS. Reporting Justice: Paulo de Tarso Sanseverino, landlines number in any 2 n issues. ding competition. activ Hotl Bank.prevail; or X – for when ant to Law no. social and e

3076 Article 3(3) of Law n. 12.414/2011 provides that excessive and/or sensitive information cannot be taken into consideration by the bureau when calculating someone’s credit score. Excessive information are understood as any and all information that is not bound to credit risk analysis; sensitive information, on the other hand, are the information related to social and ethnic background, health, genetics, sexual orientation, political views and religious beliefs.

3077 Scholars specialized on the matter have considered that the decision rendered by the Court was balanced well the interests of consumers and the credit bureaux. According to Rafael Zanatta, the decision was especially important because it acknowledged the right to data transparency and consumers’ rights to correct or update any data in order to improve their credit scoring. ZANATTA, Rafael A. F. Pontuação de Crédito e Direitos dos Consumidores: o desafio brasileiro. Instituto Brasileiro de Defesa do Consumidor. São Paulo, 2017.

(DPDC) in the Ministry of Justice, to ANATEL (telecommunications regulator) and to the Internet Management Committee.³⁰⁷⁸

The second occasion was also in a merger between Phorm and Telefonica Data S.A, in a similar association to the one between Oi and Phorm. The case was cleared at CADE, with Commissioners Marcos Verissimo and Ricardo Ruiz acknowledging the importance of the data and privacy discussion on the matter, but confirming that the issue was not under CADE's authority.³⁰⁷⁹

12.3.2 What is protected by property rights?

Several forms of protection may safeguard the appropriation of innovation in Brazil, ranging from traditional intellectual property rights (especially patents and copyright) to industrial and trade secrets.

Regarding traditional IPRs, copyright protection has greater importance in content digital markets and software. Copyright in digital markets related to content is increasingly a matter of debate. The protection of intellectual works lasts for 70 years from the death of the author (Law 9,610/98, of 19 February 1998 Art 41) or, in case of audio-visual works, from the first reproduction (Art 44). This naturally extends to works distributed by digital means (e.g. e-books and online audio-visual works). There has been an ongoing discussion about updates in the Copyright Law to take into account digital markets, resulting in a Draft Bill, subject to public consultation. One of the controversial issues has been the extent of fair use exceptions and the resort to Digital Rights Management (DRMs). However, there has been no consensus in the Ministry of Culture (now Ministry of Citizenship) on how to reconcile the views of different stakeholders in order to send the Draft Bill to Congress.

Meanwhile, courts are playing an important role in developing the body of law associated to copyright protection in digital platforms. This has led the courts to conclude that whereas internet providers do not need to monitor in advance the content posted by users, they must, once informed, immediately take down infringing content to be exempt from responsibility.³⁰⁸⁰ Copyright is excluded from the 2014 Civil Rights Framework for the Internet, which provides for a specific judicial notice-and-takedown procedure (art 19, §2 and art 31). Therefore, current Copyright Law and general provisions of the Civil Code regulate copyright protection of content in the digital platforms, until specific legislation is passed.³⁰⁸¹

The specific copyright protection of software in Brazil includes the software's source or object code, but not the technical and functional aspects of a code. The protection lasts for 50 years. There is a specific Software Law – Law 9,609 of 19 February, 1998 –

3078 Vote of Commissioner Furlan on Administrative Proceedings 08012.003107/2010-62.

3079 Vote of Commissioner Ruiz and Verissimo on Administrative Proceedings 08012.010585/2010-29.

3080 See, for example, Appeal no 1.186.616, Superior Court of Justice, Judge Minister Nancy Andrighi. 31 August 2011 involving Google Brasil Internet LTDA.

3081 See Leslie Rose, *O Código Civil Brasileiro em Inglês/ The Brazilian Civil Code in English* (Renovar 2008) art. 186 and 927.

³⁰⁸² which provides for an optional registration of the work, but companies may opt for simply using the industrial secret regime. This does not affect the claim of damages for copyright violation, as other evidence of software ownership are accepted by courts.³⁰⁸³ Brazilian courts reaffirmed that the software is protected since its creation, arising out of the novelty and creativity of the intellectual work.³⁰⁸⁴ Registration abroad is sufficient evidence of ownership.

Patent protection is less relevant in several platforms related to digital value chains in Brazil. One possible arena where patent is likely to play a special role is in the deployment of Internet of Things. According to the Study for the National Plan for IoT, incentives for the registration and ownership of patents by Brazilians through partnership with institutes and universities should be an important component of the policy to be implemented.³⁰⁸⁵ However, it is still too early to predict how IoT solutions will develop in the Brazilian market.

The National Institute of Industrial Property ("INPI") is responsible for granting patents and registering trademarks, industrial designs, technology transfer contracts, software and topography of integrated circuits. The applicable law is primarily the Brazilian Industrial Property Law (Law 9,279 of 14 May, 1996).³⁰⁸⁶ CADE and INPI have a technical cooperation agreement through which they exchange technical information and cooperate in their activities.

Among the *sui generis* IP rights connected to digital economy, one may cite the Brazilian Plant Variety Protection Act (Law 9,456 of 25 April, 1997),³⁰⁸⁷ which protects conventional plant breeding techniques not subject to patent protection. Another example is the protection of topography of integrated circuits, regulated by the Law 11,484 of 31 May, 2007 and lasting for 10 years. Images of the topography allow for the identification and characterization of the integrated system's originality.

Brazilian legislation also attributes protection on test data required for authorization of new veterinary products, fertilizers and chemicals for 5 to 10 years, by Law 10,603 de 22 December, 2002. The extension of protection to test data related to the approval of human medicine is absent in the current legislation, but has been subject to recent litigation. Criminal violation of digital commercial databases may be addressed by the provisions of unfair competition, according to art. 195 of Law 9,279 of 14 May, 1996, in line with art. 39 of the TRIPS Agreement.

³⁰⁸⁷ Available at: http://www.planalto.gov.br/ccivil_03/leis/L9456.htm

Brazilian law does not recognise *sui generis* rights concerning databases, as in other jurisdictions.³⁰⁸⁸ The Copyright Law conditions the protection of databases to the result of intellectual creation derived out of the disposition, selection and organization of data (art. 7, XIII). It confers to database owners the exclusive rights for the partial or total reproduction of databases; their translation, adaptation or reorganization, and their distribution, copy and transmission to the public (art. 87). Under Brazilian law, the inclusion of protected copyright data in databases should be authorised by the right owner (art. 29, IX). On the other hand, facts, legal texts, names, addresses, sports results etc. can be freely included in databases and remain *res commune* even after their inclusion³⁰⁸⁹.

Finally, there is no specific IPR applicable to algorithms, which will be subject to the general regime of trade secrets.

12.3.3 Privacy/Data Protection Regulation

The General Data Protection Law – GDPL (Law n. 13.709/2018, known in Portuguese as *Lei Geral de Proteção de Dados* – “LGPD”) was enacted in August 2018. The GDPL regulates the treatment of personal data in Brazil, especially in the digital environment, and was inspired by the European regulatory framework set forth by the GDPR³⁰⁹⁰. By the time of its enactment, Brazil became the 127th country to adopt such specific legislation³⁰⁹¹. The law has a *vacatio legis* of twenty-four months, coming into force only in August 2020.

The GDPL has a horizontal application, affecting both public and private sectors, online or offline³⁰⁹². Consent is the cornerstone of the law for authorization of use of personal data, but there are other hypothesis allowing such use³⁰⁹³.

3088 LEMOS, Ronaldo. “Direito, Tecnologia e Cultura” (2005) FGV Direito Rio p. 143-144.

3089 Id p. 149-150.

3090 For further comparison between the Brazilian and European regulations, please see the document produced by DataGuidance and Baptista Luz Advogados, available at: <https://baptistaluz.com.br/wp-content/uploads/2019/05/DataGuidance-GPDR-LGPD-For-Print.pdf>

3091 LEMOS, Ronaldo. Lei de Dados nasceu desgovernada. <https://www1.folha.uol.com.br/colunas/ronaldolemos/2018/08/lei-de-dados-nasceu-desgovernada.shtml>.

3092 “The LGPD has transversal and multi-sectoral application, both in public and private sectors, online and off-line. With few exceptions, such as national and public security; pure research, artistic and journalistic purposes; any practice that process personal data will be subject to the law.” (MONTEIRO, Renato Leite. The new Brazilian General Data Protection Law – a detailed analysis. International Association of Privacy Professionals. Available at: <http://tinyurl.com/yycvm7yf>).

3093 MONTEIRO, Renato Leite. The new Brazilian General Data Protection Law – a detailed analysis. International Association of Privacy Professionals. Available at: <http://tinyurl.com/yycvm7yf>. According to article 7 of the Law: “Art. 7. Processing of personal data shall only be carried out under the following circumstances: I – with the consent of the data subject; II – for compliance with a legal or regulatory obligation by the controller; III – by the public administration, for the processing and shared use of data which are necessary for the execution of public policies provided in laws or regulations, or based on contracts, agreements or similar instruments, subject to the provisions of Chapter IV of this Law; IV – for carrying out studies by research entities, ensuring, whenever possible, the anonymization of personal data; V – when necessary for the execution of a contract or preliminary procedures related to a contract of which the data subject is a party, at the request of the data subject; VI – for the regular exercise of rights in judicial, administrative or arbitration procedures, the last pursuant to Law no. 9,307, of September 23, 1996 (“The Brazilian Arbitration Act”); VII – for the protection of life or physical safety of the data subject or a third party; VIII – to protect health, in a procedure

From an international perspective, it is important to stress that the GDPL bears extraterritorial application, similarly to the GDPR in the EU. Companies that conduct business in Brazil or have at least a branch in the Brazilian territory, offering services related to data collection and treatment, are subjects to the GDPL. Moreover, the law has several instruments to allow the international transfer of personal data. The transfer may happen based on consent of the individual or based on a guarantee given by the controller of the data that it will comply with individual rights and the data protection regime³⁰⁹⁴.

An interesting point of the recently enacted law is the concept of personal data and sensitive personal data. The former is broadly defined as virtually any data that can be associated to an identifiable individual; the latter is data that, due to its nature, may expose the data subject to discriminatory practices. The sensitive personal data must be treated differently, with additional security layers³⁰⁹⁵.

The original draft of the law provided for the creation of the National Data Protection Authority. However, the President vetoed its creation by the law, based on some formalistic concerns³⁰⁹⁶. A few months later, in December 2018, the Data Protection Authority was finally created through an executive order of the President (Interim Measure n. 869/2018)³⁰⁹⁷, subsequently converted into law by the Brazilian Congress.

According to the law that amends the GDPL, the Data Protection Authority ("DPA") will be established as a body of the Federal Public Administration, under the structure of the President's office. The law also provides that the DPA's status is transitory and is subject

carried out by health professionals or by health entities; IX – when necessary to fulfill the legitimate interests of the controller or a third party, except when the data subject's fundamental rights and liberties which require personal data protection prevail; or X – for the protection of credit, including as provided in the pertinent legislation".

3094 "In a similar way to the European Union's General Data Protection Regulation, the LGPD will have extraterritorial application, that is, the duty of compliance will exceed the geographical limits of Brazil. Any foreign company that has at least a branch in Brazil, or offers services to the Brazilian market and collects and treats personal data of subjects located in the country, regardless of the nationality, will be subject to the new law." (MONTEIRO, Renato Leite. The new Brazilian General Data Protection Law – a detailed analysis. International Association of Privacy Professionals. Available at: <http://tinyurl.com/yycvm7yf>)

3095 "Art. 5. For purposes of this Law, the following definitions apply: I – personal data: information of an identified or identifiable natural person; II – sensitive personal data: personal data concerning racial or ethnic origin, religious belief, political opinion, trade union or religious, philosophical or political organization membership, data concerning health or sex life, genetic or biometric data, when related to a natural person."

3096 "The President also vetoed three articles of the bill, which dealt with the protection of personal data of access to information requests, the transfer of personal data between public authorities and private entities – such transfer will not be prohibited, but they will be based on other legal basis, and transparency on the use of data shared between public entities. Articles VII, VIII and IX of Article 52 were also vetoed, which provided for penalties for suspending and prohibiting – total or partial – the activities of processing and storing personal data in cases of violation of the legislation. In this way, only the penalties of warning, fine, blocking or elimination of data and disclosure of the infraction are provided." (MONTEIRO, Renato Leite. The new Brazilian General Data Protection Law – a detailed analysis. International Association of Privacy Professionals. Available at: <http://tinyurl.com/yycvm7yf>)

3097 The Interim Measure is a legal order prescribed by article 62 of the Brazilian Constitution. It has the same status of an ordinary law and can only be enacted by the President of Brazil in relevant and urgent cases. The Interim Measures are valid for up to 120 days and must be converted into law by the Congress during the same time span in order to retain its effectiveness. If Congress does not convert the measure into law, it becomes no longer valid.

to review by the Executive Branch in up to two years, with the possibility of being converted to a Federal Autarchy, similar to the current regulatory agencies in Brazil.

The law provides that the DPA will be structured in two different bodies: the Board of Directors, with five members, and also the National Council for Data Protection and Privacy, with 23 representatives of the government, civil society and private sector³⁰⁹⁸. It is also important to notice the provisions related to the interaction of the DPA with other regulatory agencies and the Central Bank of Brazil, in order to exercise its powers in specific sectors of the economy and government activities subject to regulation. The law also provides for a permanent communication forum among several entities of the public administration to more easily enable the regulatory, monitoring and punitive authority of the DPA.

There is much doubt on how the law will effectively be enforced, but the country is witnessing an intense movement by the major company's in order to comply with the GDPR once the grace period is over in August 2020. The law will come into force already with great challenges, especially as a growing number of IoT solutions (e.g. in smart cities) may face difficulties to obtain express consent from all affected individuals.

12.3.4 Institutional Architecture

Is there a digital platforms regulator?

Although the Brazilian Constitution recognises the role of State in the technological development³⁰⁹⁹, there is no specific digital platform regulator. Regulations affecting digital platforms are enacted by different regulatory authorities, responsible for telecommunications, data protection, consumer protection, e-government, competition and related policies, as seen above.

The main regulators with impact on digital platforms are: ANATEL (telecommunications); ANCINE (audio-visual); Senacon/MJ (consumer protection office at the Ministry of Justice); CADE (competition law) and the new National Data Protection Authority, described above. As to MERCOSUR, so far, its normative reach has not had significant impact on the digital value chains.³¹⁰⁰

3099 <http://english.tse.jus.br/arquivos/federal-constitution> Arts. 218 and 219

3100 Brazil is part of Mercosur, together with Argentina, Paraguay, Uruguay and Venezuela (currently suspended). This institutional set-up enhances cooperation in terms of science and technology and provides for an exchange of digital initiatives. The respective ministers of Science, Technology and Innovation have a forum to meet in the political level, whereas working sub-group n 1 provides a technical arena for communications. However, Mercosur's normative reach and impact in relation to internal regulations of the digital chain is rather limited, except indirectly, by means of the treaties related to consumer protection and intellectual property. See <https://www.mercosur.int/documento/organigrama-mercursos-completo/?wpdmdl=6589&refresh=5c49e805d94511548347397>

Among the offices of the central government with institutional responsibility over the digital policy in Brazil, a key actor is the Ministry of Science, Technology, Innovation and Communication. Other authorities include: the Federal Data Processing Service (SERPRO), a state owned enterprise (SOE) of information technology services in Brazil, created by Law 4.516 of 1st December 1964, and supervised by the Ministry of Economy³¹⁰¹. In the Ministry of Economy, there is also a Secretary of Digital Government, which promotes the E-Gov policy together with the Subsecretary of Digital Communication connected to the Secretary of Government in the President's office.

Which are the sector-specific regulators involved?

It is widely recognised that the two main sector specific regulators connected to digital issues are ANATEL (responsible for telecommunications) and ANCINE (responsible for audio-visual).

ANATEL, the National Regulatory Agency of Telecommunications, exercises an important aspect of the regulation of the digital chains, especially when it comes to internet access and supporting infrastructure. It was the first independent agency created and its regulatory powers were defined by the Law 9,472 of 16 July 1997, referred to in the first section.³¹⁰² It is characterised by its administrative independence, ensured by its financial autonomy and the mandate terms for its board of directors, composed by five members appointed by the President and approved by the Senate. The agency is supervised by the Ministry of Science, Technology, Innovation and Communication.

ANATEL has the authority to issue both general regulations in the form of Resolutions and individual decisions. Within its mandate, ANATEL has powers to regulate all telecommunication services, especially to enter into and manage concession contracts and to supervise the rendering of services; to grant and extinguish authorizations to render services; to set and revise tariffs for services; and to issue rules to manage telecommunication infrastructure.

Among recent decisions with impact on digital platforms, it is important to highlight the transition from analog Television to digital Television.³¹⁰³ Concerning "over-the-top services" (OTTs), ANATEL has recognised their economic effects in the market structure, especially in competition and has collaborated to the international framework initiatives.³¹⁰⁴ However, ANATEL has taken a cautious approach to any intervention, as its authority is limited to telecommunications services and it does not reach the so-called value added services, which are considered "users" of telecommunications. One recent

3104 http://www.anatel.gov.br/Portal/documentos/sala_imprensa/10-5-2018--19h12min29s-2018_Apresentacao_SG3_Resultados.pdf

and controversial exception was an injunction issued against Fox Channels, prohibiting the streaming of the so-called linear content (i.e. content equivalent to TV channels) Over the Top because it could infringe certain regulations related to pay TV.³¹⁰⁵ This case is still ongoing.

Regarding competition law enforcement, before the Law 12,529/2012, ANATEL was responsible for investigating anticompetitive conducts in the telecommunications sector and also had authority to provide subsidies to the analysis of the competitive aspects of merger and acquisitions before CADE's Tribunal – i.e. there was some overlapping competences between ANATEL and the competition authority. The current competition law concentrated all antitrust powers on CADE and ANATEL only provides industry specific technical information. Therefore, all competition enforcement related to telecommunications is carried out by CADE.

ANCINE is the national regulator for the audio-visual sector. Created by the Interim Measure n 2.228-1, of 6th September 2001 (same rank as Law)³¹⁰⁶, the agency is composed by four independent directors appointed by the President and approved by the Senate (Art. 8). The agency is currently supervised by the Ministry of Citizenship. ANCINE's main regulatory authority is related to the increase of local content and content made by independent producers and the strengthening of national programmers. This is done through the establishment and monitoring of quotas in special prime times and the conferral of financial incentives to producers.³¹⁰⁷ While its primary focus is audio-visual products, ANCINE also has regulatory functions regarding the content of digital broadcasting, especially concerning pay TV. According to Law 12,485, of 12 September 2011,³¹⁰⁸ both ANCINE and ANATEL have authority to regulate pay TV, which requires institutional cooperation in this field. There is still debate on whether ANCINE has powers to regulate video streaming over the internet, as video on demand platforms and other non-linear ones are not included in the pay TV regulations.³¹⁰⁹ ANCINE has asserted its power to regulate the registration and fees of audio-visual advertisement over the internet.³¹¹⁰ Moreover, ANCINE has taken concrete actions to address issues related to taxation of those video-on-demand providers.³¹¹¹

The Law 13,848, of 25 June 2019³¹¹² makes it clear that there should be close cooperation and exchange of experiences between regulatory agencies and competition authorities

in Brazil to ensure competition advocacy and enforcement of competition legislation in regulated markets. Regulatory agencies must monitor and report market practices to aid competition authorities in their task. In turn, CADE must report to the agencies without delay any decisions it takes on those markets. Moreover, competition authorities may request technical opinions on the agencies' subject matter. Law 13,848/2019 reinforces the application of competition law to regulated sectors both in merger control and conducts. Most importantly, art. 30 provides that regulatory agencies and competition authorities may constitute committees to exchange information and experiences and to set common guidance and procedures and allow for reciprocal consultation in regulated sectors. In practice, such cooperation has always taken place, especially in relation to cases in the telecommunication sector.

Financial Sector

The Central Bank is monitoring the progress of cryptocurrencies³¹¹³ and the Securities Commission (CVM) regulated the indirect investment in those cryptocurrencies.³¹¹⁴ National Monetary Council Resolution 4.656 of April 2018 allowed *fintechs* to operate in loan markets without the intermediation of a traditional bank. The Central Bank, together with the Ministry of Economy and the Insurance Regulator (Susep), have commenced a coordinated task force to implement a model of *regulatory sandbox* in Brazil. This initiative would cover the use of innovative technologies (distributed ledger technology, blockchain, robot-advisors and artificial intelligence) in financial services. Among the possible instruments, one can mention temporary authorizations, justified and exceptional exemption from the compliance with certain rules, and requirement of different criteria, limits and periods for new entrants using innovative technologies. This would ensure the necessary flexibility to cope with the constant digital innovation in financial services.³¹¹⁵

The Foreign Revenue Office (RFB) is in conversation with associations of cryptocurrency companies to discuss ways to tax their activities. CADE and the Central Bank have been working in close cooperation, after a decade of relative friction over the powers of competition enforcement in financial services. Since 2018, there is a Memorandum of Understanding between them that sets out the framework for cooperation and a Joint Normative Act n. 1/2018.³¹¹⁶ Both authorities will have a saying in merger control involving the financial sector and merger approval will depend on the consent of both authorities. In other words, in the rare occasions where the Central Bank identifies relevant and imminent risks to the stability of the financial system, the Central Bank will convey this risk to CADE, which will approve the merger. Most importantly, according to art. 6 of the Joint Normative Act, the Central Bank will immediately notify CADE of the prudential risks in all or in specific relevant markets related to the case. Then, CADE's analysis will

lead to the approval without restrictions of the merger. In this case, CADE's justification will incorporate Central Bank's reasoning to base the unconditional approval on efficiency and economic development.

When it comes to anticompetitive conducts, CADE takes the lead and will use information provided by the Central Bank to improve the technical consistency of its decisions.³¹¹⁷

What is the role of the competition authorities?

CADE (Administrative Council for Economic defence) is the Brazilian Competition Authority. According to Law n. 12.529/2011, CADE has two main assignments: pre-merger review and investigation of anticompetitive conducts. Also, in the so-called Brazilian System of Competition Defence, the Secretariat for Competition Advocacy and Competitiveness of the Ministry of Economy ("SACC", in the Portuguese acronym) takes the primary role of competition advocacy, championing pro-competition regulatory actions within the government, although CADE may also have specific advocacy initiatives.

CADE has a broad mandate that applies horizontally across sectors, including all digital platforms. On one hand, CADE will review any merger related to digital platforms that meet the legal thresholds (turnover requirements), having authority to approve or block specific mergers. The power to require the notification of any merger and acquisition up to one year after the conclusion, regardless of the parties' sales or turnover, is established in Art. 88 (7) of Law 12.529. According to CADE, "this possibility may be applied to mergers in the digital economy, in case where companies involved have no sales and no turnover, or when these values are very low."³¹¹⁸

Within the merger review mandate, CADE may impose structural or behavioural remedies on transactions in the digital economy in order to address competitive concerns. On the other hand, CADE has authority to investigate and punish digital platforms that violate the competition law. Investigations may address collusive or unilateral practices and may lead to fines, behavioural obligations or even exceptional structural measures of divestment. CADE has identified and sanctioned collusion through computer automation as a possible way of coordinating behaviour and reported the use of techniques such data mining and screening techniques for the detection of cartels.³¹¹⁹

CADE has not adopted toolkits, guidelines or specific policies for the digital economy. The annex of Resolution CADE 20/99 – which is 20 years old – is still referred to by CADE as a guide to the analysis of vertical restrictions, including in the digital market, but CADE makes use of academic literature and past cases to identify the particularities of those markets.³¹²⁰ Given the extensive experience in the past two decades, it would be reasonable to expect CADE to review and update these guidelines more broadly, even if not restricted to cases in the digital economy.

3120 Responses to Questionnaire submitted by CADE to the BRICS Centre in July 2019.

Regarding competition advocacy in digital markets, both CADE and SACC have played an important role in promoting competition. CADE has carried out research to deepen the knowledge about the effects of intervention in those markets and published three studies regarding urban transport regulation and its impacts on new mobility apps like Uber.³¹²¹ SACC, for its turn, has an active role in lawsuits that may tackle questions regarding competition issues.

Digital markets: Mergers

CADE has evaluated important cases regarding digital platforms in the last fifteen years, in various economic sectors. Table 14 below summarises CADE's approach to mergers related or connected to digital markets from 2004 to 2018:

Table 14 – Mergers Analysed by CADE in Digital Markets [2004-2018]

Year	# of Mergers	Blocked	Cleared*	Cleared with Restrictions
2004	23	0	20	3
2005	18	0	18	0
2006	8	0	8	0
2007	11	0	10	0
2008	27	0	26	1
2009	29	0	28	1
2010	35	0	34	1

Source: Brazil Database – BRICS Centre, based on decisions obtained from CADE's website (www.cade.gov.br) * including cases in which CADE declined jurisdiction to evaluate the merger or parties withdrew notification

3121 See, for example, the most recent one: "Competitive Effects of Sharing Economy in Brazil: Did Uber's entrance affect the taxi apps market between 2014 and 2016?". Full study (in Portuguese) available at: <http://www.cade.gov.br/aceso-a-informacao/publicacoes-institucionais/dee-publicacoes-anexos/documento-de-trabalho-001-2018-uber.pdf> . A summary of the study in English is available at: <http://en.cade.gov.br/cade-analyzes-the-competitive-effects-of-the-uber2019s-entry-in-the-market-especially-over-taxi-apps>

In the past 15 years, 94% of the decisions analysed in the database were cleared without restrictions. This figure does not differ much from the one observed in traditional markets, which has been around 97% in the last years that followed the enactment of the Law 12.259. However, one should be cautious with that comparison, since mergers in digital markets generally presents higher concentration ratios, clear dominant position, and concerns about entry barriers due to network externalities. For that reason, it was indeed expected a lower proportion of mergers cleared without restrictions.

The cases spanned throughout different levels of the digital chain and several sectors, with some concentration in telecommunications, computer programming and advertising, as shown in figures 3 and 4.

Figure 3

Source: Brazil Database – BRICS Centre

Source: Brazil Database – BRICS Centre

As indicated in Table 14 above, 11 (eleven) decisions involved restrictions ranging from the exclusion of non-competition clauses to the assumption of behavioural and structural commitments. In the period between 2004-2008, CADE cleared with restrictions certain mergers related to the provision of internet connectivity.³¹²² This may indicate special concern with infrastructure access, which justified a more active approach also in conducts, as will be seen below.

One of the most recent and relevant cases for digital platforms was the merger between Itaú (larges Brazilian private bank) and XP Investimentos, the largest Brazilian online platform for investments³¹²³. The merger was cleared with behavioural restrictions, in a split decision taken by the Council. The majority understood that the merger could be approved if some vertical concerns were neutralized by the remedies negotiated with the parties. However, it is interesting to notice the dissenting opinion of Commissioner Schmidt in the case. According to her view, XP Investimentos could be considered a maverick in the market for investments and its merger with one of the largest Brazilian banks would eliminate an aggressive and innovative player in the market. In her views, it is better to block a risky merger that can be filed again in the future than to clear a risky merger that cannot be undone in the future – clearly favouring type I errors (false positives) instead of type II errors (false negatives) in the context of digital markets. Even though this position did not prevail, it shows a growing concern with acquisitions of aggressive start-ups by incumbents.

Similar considerations were made in the case in which Naspers increased its share ownership in DeliveryHero³¹²⁴. The merger was cleared with no restrictions, as CADE found that the market for food delivery apps was very dynamic and took a cautious approach to avoid undue intervention (i.e. false positives). However, the General-Superintendence expressed concerns regarding Naspers' strategy, because it had acquired more than 10 companies in Brazil since 2013. According to the GS, such behaviour should be closely monitored in the future, because it may pose a barrier to entry. If every start-up that starts to have success is acquired, it is not likely that any of them will have the power to fully develop and become an effective rival in the market. Even though the merger was cleared in the end, the decision shows growing concern with potential competition and the role of start-ups in pressuring incumbents.

Another example of a merger relevant to digital markets is the acquisition of Time Warner by AT&T. CADE approved the transaction with the restriction of the signature of an Agreement for Concentration Control (i.e. negotiated remedies).³¹²⁵ In Brazil, the acquisition basically resulted in a vertical relation between content and channel licensing activities to paid TV operators of the Time Warner Group (programmer) and satellite

3123 Merger n. 08700.004431/2017-16. The merger was also cleared with additional restrictions by the Brazilian Central Bank.

3124 Merger n. 08700.007262/2017-76.

3125 Vote of Commissioner Gilvandro Vasconcelos on Proceedings 08700.001390/2017-14.

pay-TV supplied by Sky Brasil (packaging and distribution), company controlled by AT&T. Time Warner was found to have high market power in the relevant markets of content and channel programming and licensing in Brazil. In Brazil, TW also offered digital video services through several platforms such as TV Everywhere, and others. In the pay-TV market for distribution, there is high market concentration, with Sky and the competitor Claro/NET as clear leaders.

The vertical integration could result in alignment of incentives that would harm competitors in both markets by means of exchange of sensitive information and more favourable negotiation conditions (i.e. discriminatory practices). CADE's concerns were the incentives and capacity of Sky to discriminate other programmers that were rival to Time Warner. Moreover, CADE considered there was the possibility of market foreclosure in the pay-TV market through licensing of Time Warner's content to Sky in favourable terms, harming Sky's rivals.

The Agreement signed with CADE provides obligations that eliminate rival exclusion and discrimination in the markets of pay-TV programming and distribution. AT&T should keep Sky Brasil and Time Warner programmers as separate legal entities, with their own governance and administration structures. The exchange of sensitive information or information that could potentially result in discrimination is forbidden. AT&T must ensure that Time Warner's content offers to packaging and pay-TV distribution companies will be done on a non-discriminatory basis. Sky Brasil should not impose conditions to distribute channels of programmers not related to AT&T/TW. This required the adjustment of current contracts and established an arbitration procedure to evaluate potential breaches of the commitments undertaken by AT&T/TW. Commissioner Cristiane Schmidt also included in her Concurring Opinion that the regulators should promote changes in the regulatory framework to ensure competition with over the top providers (OTTs).³¹²⁶

A merger in the same market, whereby The Walt Disney Company acquired the Twenty-First Century Fox, was scrutinised by CADE in 2019. The merger was approved in Brazil with structural remedies, partially due to the interpretation of low rivalry coming from OTT services, consistent with the previous decision on the AT&T-Time Warner case.³¹²⁷ Among the remedies, Disney would have to sell the Fox Sports channel to another company, including broadcasting rights and contracts with pay-TV operators. Disney must abstain from contracting or reacquiring those broadcasting rights and must allow the buyer the option to licence the Fox brand without a charge.

It is interesting to notice that CADE has blocked four mergers between 2017 and 2018, the largest number in any 2-year period.³¹²⁸ The cases blocked by CADE were in tradi

3126 Concurring Opinion Commissioner Schmidt Proceedings 08700.001390/2017-14.

3127 Merger Control Agreement on AC 2019 [08700.004494/2018-53](#) Merger Control Agreement Parties: The Walt Disney Company Twenty-First Century Fox, Inc.

3128 The blocked mergers were: Merger n. 08700.002155/2017-51 (Companhia Ultragas S.A. and Liquegás Distribuidora S.A.), Merger n. 08700.006185/2016-56 (Estácio Participações S.A. and Kroton Educacional S.A.), Merger n. 08700.006444/2016-49 (Alesat Combustíveis S.A. and Ipiranga Produtos de Petróleo S.A.) and Merger n. 08700.007553/2016-83 (Frigorífico Mata Boi S/A and JBJ Agropecuária Ltda.)

tional markets, but one of them had an important digital component. The attempted merger between Kroton and Estacio involved the two leading private education providers in Brazil.³¹²⁹ The digital aspect of the merger was related to concentration in the distance-based education market. Although concentration in the on-site education market provided the rationale for the blocking decision, the level of concentration in online provision of educational services played a key role in the reasoning, as well as in some other CADE precedents cleared with restrictions.

Despite these interventions, the vast majority of mergers in the digital economy was cleared without restrictions, as it also happens in more traditional sectors. CADE has indicated that imposing a different market structure might be counterproductive and inefficient, since “winner takes most” strategies is the equilibrium in several markets.³¹³⁰ Besides, CADE has recognised the risks of a restrictive policy regarding mergers and acquisitions: it might discourage innovation as many new companies seek to be acquired by larger players.³¹³¹ Such a careful approach by the Competition Authority may represent a trend in the merger control in Brazil, especially in cases related to “new markets” with specially dynamic behaviour. Yet, some concerns with potential competition and elimination of mavericks are appearing in some cases, as illustrated above.

Digital markets: exclusionary and exploitative practices

Brazilian Competition Legislation (Law 12,529/2011) provides several tools for competition enforcement in digital markets, when it comes to abuse of dominant position and exclusionary practices. For example, the law explicitly lists among the possible anticompetitive conducts the prevention of rival's access to technology and the abuse of industrial or intellectual property rights (art 36, §3, V and XIX).

From the database of Brazilian cases, 18 (eighteen) antitrust investigations involving different aspects of the digital markets were identified and analysed:

Table 15 – Antitrust Investigations in Digital Markets [2014-2018]

Half of those cases resulted in settlements with several of the parties involved – i.e. Cease and Desist Agreements. The only case of cartel with settlements (in electronic credit for pre-paid mobile phones) is still pending in relation to other parties.³¹³² The other half had their proceedings dismissed by lack of evidence, generally following a cautious approach to dynamic markets, as shown below:

Figure 5

Source: Brazil Database – BRICS Centre

Cautious Approach: Zero Rating and Google cases

An example of the cautious approach taken by CADE is the zero rating case. At the request of the Federal Prosecutor's Office, CADE initiated an investigation against four major telecom companies – Claro, Tim, Oi and Vivo – regarding allegedly anticompetitive conducts due to the practice known as zero-rating (i.e. not charging data to access certain applications).³¹³³ Examples of the practices were offers of free and unlimited access to Facebook, Twitter, WhatsApp, music apps, or free access to certain *apps* sponsored by banks. The relevant markets potentially affected were (i) market for mobile cellular services, with four players with similar sizes; and (ii) market for applications and content, a dynamic market experiencing intense changes. CADE's General Superintendence (GS) considered that there was no exclusive dealing and that those conducts were justified by business reasons. Moreover, the GS evaluated that some of the business offers could actually foster competition and innovation, by allowing consumers to use their data plans to access other websites. The proceedings were dismissed, acknowledging that the markets were very dynamic and that there was no proof of anticompetitive effects.

The three cases brought against Google have also confirmed this trend. In all the proceedings below, CADE concluded that there was no evidence of breach of competition law and acknowledged the intense innovation in the markets and insufficient proof of effects in the market.

³¹³² Administrative Proceedings 08012.002812/2010-42

³¹³³ Preliminary Proceedings nº 08700.004314/2016-71.

First, CADE investigated alleged anticompetitive restrictions in the contracts of Google's online advertising platform, known as *AdWords*. After a long investigation with publicity agencies and advertisers, it concluded that most of the clauses in Google's terms and conditions were not capable of restricting *multihoming*. According to the GS, clauses that had a restrictive potential could not significantly affect competition in Brazil. The focus of the GS was on the lack of actual effects caused by the conduct. The case was dismissed by CADE's Tribunal on the same grounds.³¹³⁴

CADE also analysed scraping practices by Google of relevant competitive content held by rival's specific search websites, to use it in Google's own specific search services. It recognised that such practices by dominant companies should be carefully scrutinised. CADE's GS acknowledged that review gathering tools were a relevant asset in the market, but did not find a violation. Indeed, there was not enough evidence of the systematic presentation by Google of content collected from other websites. Also, the conduct would have been irrational as it could not have affected the Brazilian market.³¹³⁵ Although the case was ultimately dismissed, at the request of a commissioner, CADE decided to open a new investigation regarding Google's conduct on the reproduction of news from alleged competitors on Google News.³¹³⁶

Finally, CADE investigated if Google would be unduly favouring its own specific services within the organic results, such as *Google Shopping*, to the detriment of price comparison sites, such as the local competitor Buscapé, positioning itself in a more privileged area of the webpage (among the sponsored links). The analysis did not lead to a finding of violation. Indeed, after an extensive analysis, CADE did not identify a causal relationship between Google's conduct and any harm to competition or even to competitors. CADE also understood that *Google Shopping's* evolution throughout time showed some genuine features of innovation directed to fulfil consumers' and retailers' needs. In this context, the GS found no evidence of an antitrust offence.³¹³⁷ On 26 June 2019, the Tribunal dismissed the case in a split decision that confirmed the GS opinion.

Three commissioners found that Google violated competition law, supporting their decision on the defendant's dominant position (mainly due to network externalities and consumer bias) and potential exclusionary effects of the conduct, very much aligned with the European Commission decision on the same case³¹³⁸. One of them suggested a fine of BRL 32 million (USD 8.35 million). The other three commissioners, including the Reporting Commissioner and the President, concluded that there was no sufficient evidence of harm, even after seven years since Google Shopping had been in place, dismissing the allegation of potential effects. Moreover, they reckoned that the innovation embedded in Google Shopping created value to users, by improving matching and consumer experience. The inclination of the dissent Commissioners to vote for Google's condemnation may reveal their disposition to run the risk of type I errors (false posi-

tives) in very dynamic and uncertain markets. Still, the prevailing dismissal decision was consistent with precedents in digital markets, where in-depth scrutiny sides with greater caution and more willingness to incur in potential false negatives than false positives when dealing with innovative markets.

In any event, the investigation of digital platforms' conducts seems to be as dynamic as their innovative environment. The General Superintendence has recently opened preparatory proceedings against Google for anticompetitive practices related to Android, in mobile phone and tablets, similar to those investigated and sanctioned by the European Commission.³¹³⁹

Intervention through Settlement Agreements

The fact that CADE has been generally cautious regarding cases in digital markets has not deterred the authority from intervening in certain cases, especially through Settlement agreements (i.e. Cease and Desist Agreements), an instrument that is provided for in art. 85 of Law 12,529/2011. Indeed, CADE has used settlements to stop alleged anticompetitive conducts and establish non-discriminatory behaviour. It is not an overstatement to say that some of these settlements reshaped markets, as described below.

Telecom settlements

In the early 2000s, Telesp, Brasil Telecom and Oi, three incumbent telecommunication providers, were accused of price discrimination in the offer of wholesale access to competitors in the context of different bidding procedures for data communication services by government agencies, generating an alleged price squeeze. Telesp negotiated Cease-and-Desist Agreements, accepting to provide non-discriminatory treatment in the wholesale market of leased lines.³¹⁴⁰ The other two operators soon followed with similar settlements. Together, these settlements changed the leased line market, which was later regulated by ANATEL.³¹⁴¹

Between 2010 and 2012, cases related to discrimination in the market of Internet Service Providers were also settled.³¹⁴² Telecom companies were allegedly directing their clients of broadband internet connection services to a preferred internet authentication provider. According to the investigation, this was done by unequally displaying providers' offers and discriminatory treatment via call-center. The Cease-and-Desist Agreements provided that the telecom companies providing internet broadband connection would implement to their clients an Online Platform, which would pass on information concerning all other internet authentication providers. These cases may be seen in the

same trend as the mergers analysed above: the authority wanted to ensure competition in the infrastructure supporting internet access.

Online Travel Booking Agencies

CADE also settled an investigation about price parity clauses imposed by online travel agencies (OTAs), requiring the main players in the Brazilian market (Booking, Expedia and Decolar) to narrow down their clauses. The proceedings initiated after a complaint filed by the Brazil Hotel Operators Forum ("FOHB"), arguing that the OTAs were perpetrating anticompetitive conducts in the market for online booking services for hotels, due to the imposition of clauses known as most-favoured nation ("MFN") (also known as wide price parity clauses) to hotels that wished to be listed on the Respondents' websites.

CADE considered that the imposition of wide price parity clauses could negatively affect the incentives for competition among OTAs, as well as increase barriers to entry. Decolar.com, Expedia.com and Booking.com settled with CADE.³¹⁴³ According to the settlement agreements, the OTAs agreed to stop using wide price parity clauses, refraining from imposing to their suppliers of accommodation obligations regarding price parity to other OTAs and to off-line booking channels. However, in order to avoid free riding from hotels, CADE accepted narrow price parity clauses, allowing harmonisation of prices in limited situations: (i) in relation to general offers in the hotel website; (ii) in relation to direct hotel offers in meta-search websites and (iii) offline reservations that are publicised online. CADE also recognised that OTAs are a new digital phenomenon and, therefore, the authority still had limited experience. In this context, CADE's prohibition of wide parity clauses was limited to a period of three years, during which the authority will monitor the players' practices and the market's technological development.

Payment cards

CADE has been quite active in the payment card industry since 2009, when it investigated the exclusive dealing between Visa (platform owner) and Visanet (acquirer responsible for capturing and processing transactions). The defendants settled the case, accepting to drop the exclusive agreement and committing to implement a multi-brand acquiring system, whereby Visanet would capture transactions of other payment brands and Visa would license other acquirers.³¹⁴⁴ This settlement reshaped the market of payment cards, together with new self-regulation established by the industry association and later regulations from the Brazilian Central Bank.

More recently, in 2015, CADE's General Superintendence (GS) initiated proceedings against Banco do Brasil, Bradesco and Itau to investigate alleged discrimination and refusal to contract with independent acquirers (firms responsible for capturing and pro-

³¹⁴⁴ Administrative Proceedings 08012.005328/2009-31.

cessing transactions) that were rivals of their own controlled acquirers (Cielo and Rede). In parallel, CADE also investigated these banks and their local payment card brands (i.e. Hiper and Elo) for allegedly discrimination against independent acquirers. These investigations resulted in settlements with all the companies, providing for broad non-discrimination obligations and specific requirements of interoperability.³¹⁴⁵

Partial conclusion

The analysis of the decisions above shows that CADE has adopted a cautious approach when reaching final decisions in digital markets. Two reasons might be behind this cautious approach. First, CADE considers that, in those markets, it is more complex to demonstrate effects and causal links between the conduct and the impact in the market. In other words, there are multiple factors affecting the evolution of the market. Although the legislation is comprehensive enough to allow for intervention, based on potential effects, CADE has based its investigations of abuse of dominance on a careful analysis of effects and justifications. Second, there is a concern with unduly affecting innovation processes, which reinforces risk aversion to type I errors (false positives). This is particularly important in Brazil, which generally imports technology and is trying to create an environment that can also lead to producing new technologies (at least on the margins).

Nonetheless, similar to cases of unilateral conducts in traditional markets, CADE has been active with the use of settlement agreements to stop alleged anticompetitive conducts without full-fledged investigations. One should note, however, that some of the settlements in digital markets did not include pecuniary contribution (e.g. Online Travel Booking Agencies), which signals that the authority was less certain about the occurrence of an antitrust offence; but was concerned to move the conduct to a safe harbour. This may be an interesting approach to the extent that it streamlines solutions with relevant impacts in complex markets in which it may be difficult to prove an infringement.

What is the role of Courts in enforcing competition law and regulatory norms?

Federal courts in Brazil have the power to review administrative decisions by federal authorities and to issue injunctions against those decisions.

Appeals are filed before five Regional Courts of Appeals (TRF), and, in certain cases, further appeals can be made to the Superior Court of Justice (STJ) or the Supreme Federal Court (STF). Therefore, all the decisions taken by regulatory agencies such as ANATEL, ANCINE, CADE and other federal authorities are subject to judicial review by generalist federal courts. While this involves an assessment of the legality of the act and of the proportionality of the decision, some deference is due to the administrative and technical expertise of the agencies. Courts have the power to revoke administrative acts, such as general resolutions and individual orders containing the regulation of market structure, prices and other access regulation. Courts may also revert adjudicatory decisions, such as the ones that impose sanctions for anticompetitive conducts. Courts should take into

³¹⁴⁵ Settlement Agreements on Proceedings 08700.001860/2016-51 and 08700.001861/2016-03.

account the practical circumstances, obstacles and difficulties faced by the administrative entity taking the decision.³¹⁴⁶

It is important to emphasise that CADE has been prevailing in a significant portion of the court rulings. Generally, courts have been deferential to CADE's technical findings. In 2018, 61 of its decisions were challenged in courts, down from 79 in 2017.³¹⁴⁷ Courts have confirmed CADE's decisions in 73.5% of the cases, according to CADE's reports. CADE has used this success rate to calculate contributions in judicial settlements.³¹⁴⁸ However, some important conduct cases have been reverted by the courts. In the Medical and Industrial Gas Cartel case, for example, White Martins obtained the annulment of the decision of fines, the largest ever imposed by CADE.³¹⁴⁹ Judiciary usually observes the regularity and consistency of proceedings and the collection of evidence.

Overall, decisions about digital markets have not been challenged in courts, as there has not been large convictions and most merger and conduct cases leading to remedies have been settled directly at the administrative level.

Interaction between competition law and IP rights

Intellectual Property Rights do not benefit from an explicit exemption regime from competition law. According to Law 12,529, of 30 November 2011 (Competition Law) compulsory licensing of IP rights is one of the measures that can be imposed to approve a merger (art. 61, §2, V). It can also be imposed as a possible sanction against infringements of competition law related to the usage of IP (art. 38, IV, a). This is in line with the TRIPS agreement.³¹⁵⁰

Concerning conducts, the following are considered possible breaches of the Competition Law: impairment or prevention of the exploration of IP rights or technologies (art. 36, §3, XIV); exercise or exploration of IP rights, trademarks or technologies in an abusive manner (art. 36, §3, XIX).

In this regard, CADE has been analysing cases of abuse of IP rights, especially concerning sham litigation in the pharmaceutical sector. CADE has previously condemned the practice by companies of omitting from the courts the exact scope of INPI patent requests, which lead judges to a mistaken analysis when granting provisional measures.³¹⁵¹ More recently, CADE has taken a step back, setting out limits for the intervention in the area.³¹⁵² For example, CADE recognized that the registration of certain IP rights might be

3146 See, in this regard, Law 13,655, of 25 April 2018.

controversial but, if not clearly abusive, shall not lead to a finding of sham litigation.³¹⁵³ Moreover, in a recent precedent addressing a dispute related to alleged abuse of car-makers regarding IP rights over auto-parts in aftermarkets, CADE considered that registering industrial design for auto-parts in the aftermarket and bringing claims against breaches is not anticompetitive per se.³¹⁵⁴ In sum, CADE considered that, as anticompetitive effects are inherent in the granting of IP rights by Brazilian legislation, its jurisdiction was restricted to cases of clear abuse.³¹⁵⁵

While there are no explicit guidelines related to intellectual property, there are references to IP rights in CADE's Resolution n 2/2012, which sets out requirements for the notification of mergers. Parties notifying a merger are required to disclose patents and other IP rights (IX.3 and IX.4) and patent licensing agreements (IX.18) that may affect entry in the relevant markets.

In addition to these points, the Guidelines for the Analysis of Horizontal Mergers, published in July 2016,³¹⁵⁶ place IP ownership among the "exclusive advantages of companies" for the analysis of entry barriers.³¹⁵⁷ A section of the Guidelines refers to specificities of technology markets and recognises that traditional methods may not capture the anticompetitive effects of transactions in research and development markets.³¹⁵⁸ The Guidelines also allow for an analysis based on the acquisition of a *maverick* (disruptive rivals) and on potential competition due to pending IP rights or new product registrations.³¹⁵⁹

The recent Guidelines of Structural Remedies in merger control, published in October 2018, list the transfer of IP rights among the structural remedies that can be imposed by CADE or agreed by the parties to a notified transaction.³¹⁶⁰ IP rights are not only a key component of the assets to constitute a "viable business" to be transferred to third parties, but may also be a measure on its own.³¹⁶¹ Compulsory licensing should be done in a transparent and non-discriminatory manner.³¹⁶²

Are there any sectors exempted from competition law enforcement?

Competition law in Brazil does not include any *a priori* sectorial exclusions or exemptions.³¹⁶³ Therefore, mergers and conducts regarding digital platforms are investigated in the same way as all the other economic sectors. Exceptional exemptions are discussed only when regulation takes the entire field suppressing discretion of the undertakings to choose the key economic variables of productions (e.g. prices, quantity, quality).

12.4. Conclusion

This report presented the basic features of the digital chain in Brazil, the institutional framework for the digital economy and the main distinctive features of the Brazilian experience. There is a rapidly growing awareness and mature recognition among authorities and institutions of the complex challenges related to internet access and to the supply of digital services, with a focus on consumers and on the role of technology to promote social, economic and regional development.

The report described the main aspects of the digital economy in Brazil and analysed the role of competition law and institutions in this context. It explored the interface between regulation and competition policy and the role of courts. Several regulatory agencies and government bodies regulate aspects of digital markets. Regulations affecting digital platforms are enacted by different regulatory authorities, responsible for telecommunications, data protection, consumer protection, e-government, intellectual property among others. The sectoral regulators are generally well placed and equipped to deal with the digital aspects of their sectors. While at times there may be an overlap of competencies, different authorities have been able to cooperate, recognising their reciprocal roles in the regulation of digital chains.

The report showed that competition law in Brazil fully applies to digital markets. Not only does CADE review any merger related to digital companies that meets the legal thresholds – and might even request to review mergers that do not reach such thresholds but raise concerns – but may also impose structural or behavioural remedies on mergers to address competitive concerns. Likewise, it has the powers to investigate and punish digital platforms or companies in the digital economy that breach competition law, leading to fines, behavioural obligations or even exceptional structural measures of divestment.

Based on the pattern of cases regarding digital markets in the last fifteen years, one can conclude that despite having extensive powers to act, CADE has adopted a cautious approach when it comes to conducts in dynamic markets. Nonetheless, CADE has been using settlement agreements to deal with potentially anticompetitive conducts,

³¹⁶³ There are, however, some particularities of regulated digital sectors such as telecommunication. See OECD, Competition Law and Policy in Brazil – A Peer Review (OECD Pub 2010). Also, worth noting is that art. 90, sole paragraph, of the Competition Law provides for an exemption regarding the consortia formed to participate in public bids, which are not deemed to be “mergers” for the purpose of the law.

especially requiring non-discriminatory treatment and/or adjusting potentially harmful contractual provisions (e.g. exclusive dealing and MFN provisions). A field of particular interest and more interventions through settlements has been infrastructure access, especially in telecommunications markets that give support to internet services. The focus on providing access to infrastructure and to public utilities owned by former incumbents might provide an explanation. However, more recently, one could envisage less need for intervention as structural and technological changes in the infrastructure for internet provision makes it less reliant on incumbent advantages.

On the other hand, the concern to avoid undue interference when it comes to digital business models is evident. Practice and case law have shown that in very dynamic markets CADE is more concerned about intervening in a market when it should not have intervened (false positive errors – over-enforcement) than about not intervening in a market when it should have done so (false negative error – under-enforcement). CADE has also expressed the view that other authorities might be better placed to deal with certain issues such as privacy and consumer protection. This conclusion is based not only on CADE's decisions in cases related to digital markets but also on the comparison with the decisions on cases about the traditional industry, for which the Brazilian competition authority has been relatively more active.

Chapter 13: Country Report – Russia^{3164*}

Ekaterina Semenova, Ekaterina Perevoshchikova, Anna Pozdnyakova, Igor Kharitonov & Daria Kotova.

Introduction

This Report on the digital competition in the Russian Federation gives an overview of the current state of development of the digital economy in Russia and the approaches that legislators, sectorial regulators and the national competition authority take toward the various aspects of the new technological environment. It explores the general level of digitalization of the Russian economy and penetration of various technological developments, including digital platforms, e-commerce, Internet of Things, blockchain, etc. It then proceeds to describe and critically assess the institutional framework for the digital economy, the regulation effected and the competition law enforcement practices implemented during the last decade with regard to the new technological phenomena. It also presents succinctly the public debates surrounding the challenges posed by digitalisation in Russia and the ongoing reforms of competition law and regulatory policies intended to facilitate the large-scale digital transformation of the Russian economy.

13.1. What is the Business/Technological Environment for the digital economy in your jurisdiction?

13.1.1. What is the Internet access penetration level in your jurisdiction as part of the total population?

Providing fast, secured and affordable Internet to the wider population and business has been in focus of Russian authorities for a while now. According to the World Bank report, in the past years, Russia has developed a fairly strong and advanced digital infrastructure marked by a competitive telecommunications market, high rates of mobile penetration, affordable broadband, and a high level of cybersecurity.³¹⁶⁵

Composition of Internet users

As of the beginning of 2018, the Internet access penetration level among the Russian population 16+ had grown up to **72,8%** of the total population and reached 87 mil-

³¹⁶⁴ * The legislation is described as of 25 February 2019, unless specified otherwise. The exchange rate from roubles to euro is taken as of 25 February 2019, unless specified otherwise.

³¹⁶⁵ The World Bank Group Report, 'Competing in the Digital Age: Policy Implications for the Russian Federation' (September 2018), 6, <www.worldbank.org/en/country/russia/publication/competing-in-digital-age> accessed 20 February 2019.

lion.³¹⁶⁶ There are big differences in the Internet penetration level among various age categories: thus, 98% of young people (16-29 years old) and 83% of middle-agers (30-55) use Internet actively, while the share of older people (55+) remains much lower (36%), though growing steadily.³¹⁶⁷ The statistics shows that men are more active Internet users than women (as of winter 2017-2018, 74% of men and 69% of women were active users of the Internet).³¹⁶⁸

The number of Internet users on mobile devices is growing at an impressive pace. At the end of 2017, it amounted to 67 million people (56% of the total population). This is mainly related to increase in the penetration of smartphones. Thus, by the beginning of 2018, more than half (51.5%) of adult Russian population accessed Internet using smartphones. The share of users that access Internet only via mobile devices is the highest among young people (below 30) and population of rural areas.³¹⁶⁹

Regarding the geographic dispersion of the Internet users, there is a noticeable decrease in Internet penetration level as we move from big cities to rural areas, as represented in the table below (as of winter 2017-2018):³¹⁷⁰

	Moscow	Cities 500,000+	Cities 100,000+	Other cities (less than 100,000)	Rural areas
Internet Penetration Level	82%	75%	76%	71%	62%

Availability of Internet Networks

Internet access in Russia is available to businesses and to home users in various forms, including dial-up, cable, DSL, FTTH (fiber to the home), mobile, wireless and satellite, with the fiber remaining the most popular one.³¹⁷¹ According to the World Bank, Russia has achieved notable progress in developing a robust national broadband infrastructure and extensive mobile penetration.³¹⁷² As of June 2017, about 72.6 percent of Russian households enjoyed broadband Internet access, with active mobile broadband penetration at 74.9 percent.³¹⁷³ Mobile broadband connectivity is close to average for advanced

3166 GFK Report, 'Penetration of the Internet in Russia: Results of 2017' (2017) <www.gfk.com/ru/insaity/press-release/issledovanie-gfk-proniknovenie-interneta-v-rossii> accessed 25 February 2019. According to the latest survey of the National Public Opinion Research Center (WCIOM) (as of 3 February 2019) 67% of the adult (18+) Russian population use Internet on a daily basis – <https://wciom.ru/news/ratings/polzovanie_internetom> accessed 25 February 2019. This discrepancy might be attributed to the difference in how the 'Internet access penetration' is defined for statistical purposes, and also due to inclusion of 16-18 age group in the GFK's survey.

3172 World Bank (n 1) Executive Summary, xxiv.

3173 World Bank (n 1) 53.

economies (60 active subscriptions for every 100 inhabitants), the rates of mobile phone penetration is one of the highest in the world, with the transition to 3G and 4G easier than in other markets.³¹⁷⁴ Russia has also the highest number of fiber connections in Europe.³¹⁷⁵ Russia is rapidly expanding its FTTH network, leapfrogging many European countries that have copper-based broadband access infrastructure.³¹⁷⁶

Said that, the digital divide between different regions of the country and between rural and urban areas remains a significant problem in Russia. The connectivity of ultra-remote and less economically developed areas in Russia is significantly lower than the most advanced ones.³¹⁷⁷ The disparities in access to mobile broadband are less salient, with mobile access sometimes compensating for the lack of fixed broadband.³¹⁷⁸ Rural areas remain the most under-provided – as of 2015, only one third of households in rural areas had broadband access to Internet.³¹⁷⁹ The state recognized the digital divide as a significant obstacle to effective digitalisation and in 2014 introduced the plan to connect remote settlements to the fiber Internet networks, as will be described below.

To order to provide access to the Internet to wider population, Russia relies heavily on state-owned companies.³¹⁸⁰ Thus, during recent years, the state-controlled telecom service provider Rostelecom has been holding leading positions in the market of fixed-broadband Internet services. As of 2017, Rostelecom served 37% of the users of the broadband Internet, his closest rival ER-Telecom – 11%, MTS – 9%, Vimpelcom – 7%, and Transtelecom – 5%.³¹⁸¹ Privately-owned ER-Telecom is the fastest growing Internet provider with its market share increased by 12,4% (mostly through mergers) in 2017,³¹⁸² while the state-backed giant Rostelecom has the largest increase in the absolute number of new subscribers – 400,000 in 2017 (+3,4%).³¹⁸³

Rostelecom is a vertically-integrated incumbent operator controlling nearly all key elements of the broadband value chain (access, although to a lesser extent in the biggest cities; backbone; and international connectivity). The company has approximately 500,000 km of backbone infrastructure and controls the basic capacities in six international fiber-optic cable systems.³¹⁸⁴ Transtelecom, another large state-controlled compa-

3182 *ibid.*

3183 As of 2013, Rostelecom held 44,63% in the fixed-broadband market, raising concerns that strengthening its position will lead to the less competitive market and conflict of interest as the state acted as policymaker, regulator, and a significant market player (through Rostelecom) – see Carlo Maria Rossotto and al. (n 7), 32, 37.

3184 *ibid.* 37.

ny, operates the country biggest DWDM fiber backbone and other important elements of the Internet infrastructure which runs over 53,000 km.³¹⁸⁵ Both companies control many commercial Internet provider functions in large cities, but importantly most of the existing country-wide cable lines. The independent mobile operators and internet service providers typically rely on the state-controlled backbone infrastructure in provision of their services. This might bring about the conclusion that the Russian market for the Internet access services is quite competitive, but it exhibits certain degree of reliance on the state-owned infrastructure with the two state-owned operators being the leading players in the market of access to the Internet backbone infrastructure.

During last years, the state has attempted to exercise more control over the critical internet infrastructure, which further solidified position of the state-owned companies. Thus, historically, the largest traffic exchange point of the Russian Internet was MSK-IX. A few years ago, it became the part of privately owned Safedata data center group which operated big data centers in the Russian Federation.³¹⁸⁶ In 2015 Rostelecom bought a controlling stake in Safedata and gained control over the main traffic exchange point of the Runet, as well as entered the market of data storage in the run-up to enforcing the law on the storage of Russian users data exclusively in the Russian territory.³¹⁸⁷ The Ministry of Communications and Mass Media was the originator of the bill on the critical infrastructure of the Internet. The bill proposed creating a state information system (GIS) "Internet", which would contain information on critical infrastructure, including cross-border Internet channels and traffic exchange points, and obliging Internet providers to pass traffic only through traffic exchange points registered in the GIS Internet.³¹⁸⁸ This bill has not been approved. However, in December 2018 the Ministry of Digital Development backed another legislative proposal, on the autonomous operation of the Runet³¹⁸⁹ – the so-called law on "digital sovereignty"³¹⁹⁰ (has been approved in the first reading). The aim of this proposal is 'minimizing the trans-border transfer of the data exchanged between the Russian users' and ensuring the stable 'performance of Russian Internet in case Russian telecom operators are not able to connect to the foreign root Internet servers'.³¹⁹¹ This proposal establishes additional requirements to the Internet

3191 *ibid.*

service providers including abiding to the traffic routing rules set forth by Roscomnadzor; use of only traffic exchange points registered by Roscomnadzor; installing surveillance equipment that can be operated from a single control centre. The proposal also gives Roscomnadzor exceptional powers to perform the centralized control of all the Internet traffic in case of security threats.³¹⁹² It is considered as significant broadening of controlling powers of the state over the Internet traffic, as well as favouring state-controlled companies like Rostelecom trying to monopolize its position in the market of IP traffic transit.³¹⁹³

Do Internet networks have the status of utilities? Are they subject to regulation?

In the Western countries (most notably in the USA) there have been a long standing debate whether the Internet services should be treated as a public utility (like phone or electricity) and, as a result, whether the government should provide equal access to it at the affordable price – or whether it should be provided by free market forces. Thus, in the USA the broadband Internet was granted the status of public utility in 2015 and reversed back to information service classification in early 2018.³¹⁹⁴

In Russia the Internet access is treated as information service provided on a commercial basis. There are no specific regulations on providing equal access to the Internet as a public utility. Said that, FAS of Russia considers implementing this point, via setting forth in the legislation the non-discriminatory access of telecom operators to residential buildings in order to place their communication (Internet) infrastructure and provide Internet services to the end users.³¹⁹⁵ This should provide the equal access of all residents to Internet networks on accessible prices.

Affordability of networks

The Russian Federation consistently occupies top positions in the ratings of countries with the most affordable Internet. As of 2018, Russia occupied fourth place in the rating of countries with the cheapest fixed broadband Internet with the average cost of broadband amounting to 9,77\$ per month.³¹⁹⁶ Also at the end of 2018, Russia was in the top-10 countries with the cheapest mobile Internet.³¹⁹⁷

Said that, there is a certain degree of price dispersion among various cities and regions with the most expensive cities having the Internet prices 5-6 times higher than the

cheapest ones.³¹⁹⁸ As pointed in the World Bank Group report, the price decreases are most noticeable in bigger cities due to more competitive markets, both in terms of the number of operators and the type of technological platform, while the highest prices usually characterise the Far-Eastern Region and the oil-rich areas in the far North.³¹⁹⁹ This can provide the direct link between competition in the Internet services market and the affordability of the Internet to wider population.

Is universal service for Internet access available? What are the forms it takes?

In 2014, the Federal Law 'On Communication' was supplemented with the new universal communication service ('UCS'), namely fast-speed connection to the Internet based on the fiber-optical network through access points in settlements with population of 250-500 people and through collective access device in settlements with population of at least 500 people.³²⁰⁰ According to the law, a sole operator that occupies significant position in the shared communication network market in at least two thirds of the Russian regions must provide such UCS.³²⁰¹ The operator must maintain the existing infrastructure of the UCS, including public Internet access points, as well as provide fast broadband Internet to end users. Rostelecom was selected as the sole operator for UCS based on the ten years Universal Service Obligation contract financed from the Universal Service Fund (to which all mobile operators make obligatory contributions). According to this contract, by the end of 2018 Rostelecom must provide connection access points to 13,600 rural settlements.³²⁰² As of 31 December 2017, Internet access points started to operate in 5,656 settlements with the rolling-out plan implemented by 40.5%.³²⁰³ This is a significant step towards eliminating the digital divide between different territories of the Russian Federation. Importantly, since 1 August 2017, Rostelecom cancelled the fee for use of the Internet access point provided as the UCS, which further boosted their usage.³²⁰⁴

13.1.2. Digital Economy Growth levels in your jurisdiction the last 5 years

Author: Igor Kharitonov

During the last few years Russia has hit the headlines because of its ambitions to transform the economy and become competitive in the digital sphere.³²⁰⁵ However, according

to the World Bank's research, the strong commitment of political leaders to such changes is not matched by traditional commercial sectors.³²⁰⁶ The research has emphasized the government-led digitalization of public sector with private sector failing to catch up.³²⁰⁷

Nikolay Nikiforov, at the time the Minister of Communications and Mass Media of the Russian Federation, mentioned in his speech to the State Duma³²⁰⁸ in 2017 that digital economy demonstrated significant growth by 59% from 2011 to 2015 which constituted 24 % of the overall GDP growth for the five-year period.³²⁰⁹ According to the McKinsey research, the digital economy amounted to 3.9% of the total GDP as of 2015.³²¹⁰ From 2011 to 2015 the digital economy grew 8.5 times faster than other sectors of Russian economy.³²¹¹

The Russian Association for Electronic Communications stated at the end of 2018 that internet economy amounted to 5.1% of the GDP with the growth of 10-15% per year while the overall share of sectors connected to digital economy exceeded 20% of the GDP.³²¹²

Information and communications technology (hereafter – **"ICT"**) sector constituted on average 2.6% as a percentage of the GDP from 2015 to 2017.³²¹³

Smart cities and networks development

In 2018 Ministry of Construction Industry, Housing and Utilities Sector of the Russian Federation (hereafter – **'Minstroy'**) adopted the "Smart city" project which should be completed by 2024.³²¹⁴ Minstroy proposed, among other things, to adopt the new legislation; to increase efficiency of utilities infrastructure through digitalization; to use digital platforms for city resources management; to create intelligent transportation system, and to introduce 'City IQ' metrics.³²¹⁵

3215 'The Project "Smart City" of Minstroy of Russia is Supported by the Expert Group of "Digital Economy"' (Minstroy Russia,

According to the research prepared by the Center for Strategic Research (hereafter – ‘CSR’), Russian projects on urban digital transformation are focused mainly on modernization of infrastructure and are narrow in their scope while more broad solutions are implemented only on the level of greenfield projects.³²¹⁶ The examples of such greenfield projects are ‘Innopolis’ in the Republic of Tatarstan, Kazan Smart City, ‘Akademicheskiy’ district in Yekaterinburg, ‘Skolkovo’ in Moscow Region and ‘Innograd Yuzhniy’ in Saint-Petersburg.³²¹⁷ Besides such ambitious projects, there are local solutions like ‘Active Citizen’ platform for electronic referendums in Moscow or free wireless internet provided at the Moscow public transportation.³²¹⁸ More complex and sweeping projects are connected, for example, to security, use of smart grid and smart lighting.³²¹⁹ As for the greenfield projects, Skolkovo provides complex solutions with ‘fundamental improvements to urban infrastructure with the help of network technologies and the introduction of services for life, work, studies as well as the development of an interface making it possible to fully utilize the opportunities of a ‘smart city’.³²²⁰ The project of Innopolis involves the creation of ‘an extensive business infrastructure (technology parks, development centers, etc.), Russia’s first IT University (in partnership with Carnegie Mellon University, USA), a full range of social and commercial infrastructure’.³²²¹

Moscow also actively applies smart city concepts. An example of a smart-city project is Rublyovo-Arkhangelskoye district designed by famous architects with an ambition to create a sustainable smart city.³²²² Moreover, there is a ‘Smart City – 2030’ project on a city-level.³²²³ This initiative covers multiple domains like human and social resources, urban environment, digital mobility, city economy, safety and ecology, and digital government.³²²⁴ According to this project, the smart city’s architecture is comprised of four levels: consumers and interfaces, services, data, and digital infrastructure (telecommunication networks, data storage, information security, video monitoring, and alarm).³²²⁵

Researchers from the CSR assessed the development of technology in Russia needed for smart cities based on the patent activity. For example, Russian technologies connected to fire alarm systems, building safety, outdoor surveillance systems, high-voltage

3225 *ibid* 44.

alternating current systems, inverters, and connected car systems are on a par with the level of world leaders in these spheres.³²²⁶ On the other hand, technologies related to smart home, transportation, and medicine as well as control of energy, heat, and water usage are significantly lagging behind the leaders in these areas.³²²⁷ The Russian technologies in smart management of waste, housing and utilities together with sharing economy, internet of things, BIM and 5G are even less developed.³²²⁸

Corporate finance for the digital economy

As digitalization of Russian economy is to some extent pioneered by the state, implementation of ambitious national programmes involves considerable state funding. According to the Passport of the National Programme 'Digital Economy of the Russian Federation', the spending from all sources should amount to (as a percentage of the GDP) 1.9% in 2018, 2.2% in 2019, 2.5% in 2020, 3% in 2021, 3.6% in 2022, 4.3% in 2023, 5.1% in 2024.³²²⁹ The overall spending between 2019 and 2024 is estimated to be 1,837,696 million roubles (approximately 24,723 million EUR) with non-budget sources equals to 535,315 million roubles (approximately 7,201.8 million EUR).³²³⁰ The government will allocate the funds mostly to the 'Information Infrastructure' project (772,401 million roubles – approx. 10,391.5 million EUR),³²³¹ 'Digital Technologies' project (451,809 million roubles – approx. 6,072.4 million EUR),³²³² and 'Digital Public Administration' project (235,705 million roubles – approx. 3,171 million EUR).³²³³

The significant state support of domestic R&D projects is not matched by the compared private funding. Thus, the World Bank's report suggests that substantial Russian state support for the private sector R&D promotes 'over-reliance on government funding', as the business contribution to gross domestic R&D expenditure remains low compared to other global tech leaders.³²³⁴

In 2017, the Russian Venture Company (hereinafter – '**RVC**') prepared the Report, which shows that venture capital funding faces some difficulties in Russia. Thus, the Report indicated that the amount of venture investments decreased from 376 million dollars in 2012 to 120 million dollars in 2016-2017 with a median size of a deal decreased by more than 11 times.³²³⁵ Additionally, investors shifted to late-stage ventures after the recession of 2014 in order to reduce risks. Another factor contributing to the decrease in pri-

vate investments was availability of financing via grants which provide more preferential terms, thus, making early-stage start-ups to seek grants rather than VC funding.³²³⁶ Lack of exit opportunities is considered to be a serious problem as well.³²³⁷ At the same time, state-backed venture funds reduced its presence in the Russian market focusing mainly on biotech and industrial technology rather than the ICT sector.³²³⁸

The Russian Venture Capital Association provided statistics on the investments in the Russian ICT sector. In 2013, private equity (PE) and venture capital (VC) investments amounted to 1,574 million dollars, but this figure dropped to 173 million dollars in the three quarters of 2018.³²³⁹ The amount of PE investments outweighed the VC investments during this period.³²⁴⁰ Decomposing the size of VC investments by fund type shows that state-backed VC funds participated in 11% of overall investments in 2017, corporate-backed funds accounted for 5% of investments in three quarters of 2018, seed funds participated in 23% and private funds – in 83% in the same period.³²⁴¹

There are some examples of successful mixed state-private funding. According to 2017 Global Start-up Ecosystem Report, 'Skolkovo technopark, Moscow's most prominent incubator, raised \$158 billion in funding from the government, foundations, and investors'.³²⁴²

At the same time the authors noted that 92% of seed rounds came from Moscow investors, indicating a lack of capital attracted from outside of the capital city and making it more difficult for regional start-ups to access funding.³²⁴³ Additionally, Moscow's ecosystem showed one of the worst rates of early-stage funding growth due to political issues.³²⁴⁴ Overall ecosystem value was estimated at 3.4 billion dollars with global median at 4.1 billion dollars.³²⁴⁵

Upon analysis of venture investments in 2018, the Inc. Russia magazine and RVC stated that foreign investments accounted for 12,615.4 million roubles, corporations for 8,570.7 million roubles, private investors for 1,860.1 million roubles, state funds for 1,765 million roubles, private funds for 1,457.4 million roubles, accelerators for 466.8 million roubles.³²⁴⁶ According to the same source, foreign investments accounted for 47% and domestic investments – for 53% of the overall capital invested in Russian start-

ups. Some trends of 2018 include the overall growth of the VC market (which is still a small one), active participation of corporations, and active involvement of state.³²⁴⁷ Thus, in 2017 Russian President ordered five Russian state corporations (Rosatom, Rostec, Roscosmos, United Aircraft Corporation, United Shipbuilding Corporation) to set up venture funds with participation of RVC.³²⁴⁸ Additionally, according to news, the Government might ask all state companies to set up their own corporate venture funds to invest in innovative start-ups.³²⁴⁹

At the end of 2018 RVC together with the EY ranked venture funds based on the number of deals for 2018, with the top venture funds being: Runa Capital, I2BF Global Ventures, Target Global, Primer Capital, Fort Ross Ventures, and Gagarin Capital.³²⁵⁰ Top seed funds include IIDF, Day One Ventures, TealTech Capital, Finshi Capital, Moscow Seed Fund, The Untitled ventures.³²⁵¹ The most active foreign funds were GPS Ventures, Vostok New Ventures, FJ Labs, Access Industries.³²⁵² Additionally, RVC partnering with the PwC identified the most active corporate investors: Sistema, Sberbank, Mail.Ru Group, QIWI, PIK Group, Rosnano, Softline, S7 Group, Rostec, and Pharmstandard.³²⁵³

13.1.3. How many consumers are actively engaging in e-commerce?

Author: Daria Kotova

Russian law does not have a specific definition for e-commerce,³²⁵⁴ but according to the OECD definition, electronic commerce, or e-commerce, is 'the sale or purchase of goods or services, conducted over computer networks by methods specifically designed for the purpose of receiving or placing of orders'.³²⁵⁵

As described in the above section 1.1., the high level of ICT development and Internet access penetration provides the necessary conditions for functioning of e-commerce in Russia. Although the Russian e-commerce market is developing, it has not reached yet the capacity and ambition of the leading markets, such as Germany, United States and

3262 ibid 23.

and electronics).³²⁶³ In general, the e-commerce market is weakly consolidated with the four largest actors controlling only 27% of the market in the absence of one dominant actor.³²⁶⁴

As for the consumer behavior, online supermarkets, electronics stores and fashion on-line stores together process 61% of all posted orders (28% and 33% respectively).³²⁶⁵ Young consumers prefer smartphones and online shopping applications, although the majority of orders are posted via desktop computers and laptops.³²⁶⁶

Apart from using online shops and shopping platforms, Russian consumers also actively use C2C e-commerce services. According to Data Insight, C2C online sales process 90 million of orders and receive 295 billion roubles of revenue, as compared to 230 million of orders and 970 billion roubles of revenue received from B2C online sales.³²⁶⁷ Almost 87% of private vendors use Internet as a tool for sales. However, their activity is mostly limited to local markets (most often their hometowns).³²⁶⁸ The largest online platforms for C2C sales are domestic V Kontakte, Avito, Youla, although foreign platforms, such as Instagram and WhatsApp, are also present.³²⁶⁹

While it is obvious that the Russian e-commerce market is growing and gaining traction, it also has certain features that may slow down its development. For example, there is large discrepancy in geographical distribution of online sales, most of which are accounted for big cities. C2C sales are also limited to the specific territories, they are concentrated and seem to be popular among consumers who normally do not shop online.³²⁷⁰ Finally, the cost of delivery is high while the delivery itself is very slow and almost always provided by the traditional postal service provider, Russian Post.³²⁷¹ Marketing strategies are also imperfect with only limited number of marketing tools used by Russian online sales platforms.³²⁷²

To summarize, the Russian growing e-commerce market suggests the need for a more in-depth analysis of e-commerce as a part of the digital economy and, in particular, for the preventive analysis of market power in the e-commerce market which might potentially face consolidation and emergence of one dominant actor.³²⁷³

13.1.4. Engagement with social networks

Author: Katya Semenova

Most popular social networks in your jurisdiction

National networks Vkontakte and Odnoklassniki are the most popular social networks in Russia followed by foreign networks Instagram, Facebook, Twitter, Youtube and domestic networks Moi Mir, and LifeJournal.³²⁷⁴ According to the World Bank, Vkontakte outranked other social network in Russia by the number of messages and authors per month, as users post 60% of the public messages in Vkontakte.³²⁷⁵ Moreover, according to the World Bank, national social networks have much higher revenues than their foreign competitors in Russia.³²⁷⁶ Domestic social networks Vkontakte and Odnoklassniki surpass foreign ones, since Russian networks have localized interface and simple settings.³²⁷⁷ Nevertheless, World Bank experts note that the share of foreign social networks is growing in Russia among the mobile audience, as mobile access gains popularity.³²⁷⁸

Do consumers practice single-homing or multi-homing regarding social networks?

Consumers in Russia actively practice multi-homing regarding social networks, meaning that they have active accounts in two and more social networks simultaneously.³²⁷⁹ According to Mail.ru Group, the owner of the Russian most popular social networks Vkontakte, Odnoklassniki, and Moi Mir, in 2015 84% users of Odnoklassniki visited Vkontakte, whilst 68% users of Vkontakte used Odnoklassniki, and 80% of Moi Mir users had accounts both in Odnoklassniki and Vkontakte.³²⁸⁰ Moreover, 96% of Twitter users visited Vkontakte, and 43% of Facebook users had accounts in Vkontakte.³²⁸¹

According to the statistics of Russian marketing company HIConversation, in 2018 19 billion users practiced single-homing regarding Vkontakte, whilst only 1.8 billion users

3274 Yaroslav Eferin, Yuri Hohlov, and Carlo Rossotto, 'Digital Platforms in Russia: Competition Between National and Foreign Multi-sided Platforms Stimulates Growth and Innovation' (2019) Vol. 21 Issue: 2 Digital Policy, Regulation and Governance 129, 141 <<https://doi.org/10.1108/DPRG-11-2018-0065>> accessed 06 March 2018. See also 'Report of Brand Analytics. Social Networks in Russia: Numbers and Trends' (Autumn 2018), <<https://bit.ly/2StBB5A>> accessed 06 March 2018.

3275 World Bank (n 1) 41.

3276 *ibid* 41.

3277 For example, Vkontakte was always available in Russian language, whilst Facebook was initially in English. In addition, Vkontakte has plain settings and is easy to use and share media files. See Baran, Katsiaryna S., and Wolfgang G. Stock, 'Acceptance and Quality Perceptions of Social Network Services in Cultural Context: Vkontakte as a Case Study', Proceedings of the 9th International Multi-Conference on Society, Cybernetics and Informatics (IMSCI 2015), 12 <https://www.researchgate.net/publication/291350866_Acceptance_and_Quality_Perceptions_of_Social_Network_Services_in_Cultural_Context_Vkontakte_as_a_Case_Study> accessed 06 March 2018.

3280 *ibid* slide 7.

3281 *ibid*.

used Facebook as the only social network.³²⁸² Moreover, 19.7 billion users practiced multi-homing regarding both Vkontakte and Facebook, and 21.6 billion users practiced multi-homing regarding Vkontakte and Instagram.³²⁸³ Therefore, multi-homing regarding social networks is wide spread in Russia with the majority of single-homing users belonging to Vkontakte.

13.1.5. Level of development of the IoT and Industry 4.0. in your jurisdiction

Author: Daria Kotova

According to expert estimates,³²⁸⁴ Russia is at the stage of early adoption of the Internet of things ('IoT') and other technologies brought by Industry 4.0. The IoT-related markets in Russia encompass equipment producers, network equipment producers, telecom operator, IoT platforms operators, start-ups, associations and investors as well as developers of applications and ready-made solutions.³²⁸⁵ Thus, the elements of Industry 4.0 are already functional in Russia, although the regulatory framework is still falling behind.

Certain estimates are already available on the volume of the Industry 4.0. in Russia, though they are not very consistent. This may be due to the lack of clear understanding of how Industry 4.0. functions and what technologies it includes. For instance, estimates by the Russian IT experts and businesses ranged from 40 to 600 billion roubles for 2018.³²⁸⁶ AC&M Consulting is more pessimistic with only 11 billion roubles for 2018.³²⁸⁷ Nonetheless, the forecasts for the industry development remain generally positive. For instance, PwC calculated that the cumulative effect from the use of IoT in various industries may reach 2,8 trillion roubles (approximately 37.6 billion EUR) by 2025.³²⁸⁸ While less optimistic forecasts estimate the possible revenue increase from 220 to 592 billion roubles,³²⁸⁹ all estimates coincide that the IoT industry in Russia will continue its growth.

This statement is also supported by increasing attention of state authorities who seek to regulate the emerging economy. As noted by RAEK and Rostelekom, the regulatory framework starts to take shape along with the spread of the IoT, leading to eradica-

3288 PwC, Internet of Things. Future Technology Available Today (PwC Russia 2017) <https://www.pwc.ru/ru/publications/IoT_English_version.pdf> accessed 6 March 2019 5.

3289 'The Internet of Things (IoT) Market May Exceed 590 bln. Rubles in 2022', RBK (24 August 2018) <<https://marketing.rbc.ru/articles/10435/>> accessed 6 March 2019.

tion of technological and economic obstacles.³²⁹⁰ Examples of the regulatory initiatives for the new economy include the National Programme 'Digital Economy of the Russian Federation' that defines the federal projects in IoT-related spheres,³²⁹¹ and the roadmap 'Development of Technologies in the Sphere of the Internet of Things'³²⁹² prepared with the participation of the industry.

Statistics already indicates the companies that currently lead the process of harnessing the IoT and other technologies in Russia, such as MegaFon (telecom provider), MTS (telecom provider), Rostelekom (telecom provider), Kaspersky Laboratory (software developer), Vimpelcom (telecom provider), Rostech (state-owned corporation).³²⁹³ Other companies in this ranking, however, are the foreign players, such as Microsoft, IBM and others. As for the patent activity, according to the data of European Patent Office, Russia has submitted 109 patent applications for inventions related to Industry 4.0. since 1991 and occupies the 23rd place in the ranking.³²⁹⁴

The development of the IoT and Industry 4.0. in Russia faces both challenges and positive perspectives. As noted by Sergey Alimbekov from the Internet Initiatives Development Fund, a venture capital fund, the lack of infrastructure in Russia creates a bottleneck for the businesses willing to use the new technologies.³²⁹⁵ Along with the lack of common industry standards and regulatory framework,³²⁹⁶ the challenges include cyber security issues and regulatory threats expressed in a less liberal regulatory environment than needed for the smooth development of the new technology.³²⁹⁷

Nonetheless, the Russian IoT market has many opportunities for development and improvement. Economic factors, such as availability of state programs, reduction of prices for equipment and development of the Big Data market contribute to creation of the 'IoT-friendly' business environment in Russia.³²⁹⁸

13.1.6. Please specify the major digital platforms in your jurisdiction and their market penetration.

Author: Katya Semenova

Being a part of the global digital economy, the Russian economy attracts the major transnational digital platforms, as well as gives rise to the national ones. The platforms, both national and transnational, operate in various service markets ranging from agriculture, tourism, health, transport, finance to online advertising, cloud computing, taxi aggregator and others.

Internet access providers. The development of broadband Internet access (including technologies of the future, such as 5G and Narrow-Band IoT standard) is a priority set forth in the strategic legal documents.³²⁹⁹ To achieve the ambitious goal of high speed broadband internet services across the country, legal documents require to build infrastructure network facilities, and reduce administrative barriers to provide competitiveness in Russian broadband market.

Russian broadband market, both fixed and mobile, is moderately concentrated. According to the 2015 World Bank report, the following five companies had the largest shares in Russian fixed broadband market in 2013: Rostelecom (44.8%), ER-Telecom (11.3%), Mobile TeleSystems (10.2%), Vimpelcom (9.7%), TransTeleCom (4.7%), and AKADO Telecom (3.3%).³³⁰⁰ Notably, three of these companies are also major players in the Russian mobile broadband market: Vimpelcom (35,7%), Mobile TeleSystems (33,46%), and Rostelecom (1.45%).³³⁰¹ Other big players in the mobile broadband market are Megafon and Tele2. According to the Report of TMT-Consulting as of 2018,³³⁰² the list of major players in fixed broadband market has not changed, but the level of market concentration has grown since 2014, as total share of major companies increased up to 70%.³³⁰³

Moreover, Rostelecom is the sole operator of the universal communication service,³³⁰⁴ providing broadband access for remote underpopulated regions of Russia. Since the National Program 'Digital Economy of the Russian Federation' requires to provide broader internet access throughout the country, aiming at 89% Internet access penetration by 2021,³³⁰⁵ Rostelecom will further enhance its market power, as the sole operator as UCS.

3299 The Presidential Decree dated 09 May 2017 No 203 on the 'Strategy for the Development of the Information Society in the Russian Federation for 2017-2030'; the Presidential Decree dated 7 May 2018 No 204 on 'National Goals and Strategic Challenges in the Russian Federation for the Period up to 2024'.

3300 Carlo Maria Rossotto and al. (n 7) 34.

3301 ibid 32.

3302 Considering lack of recent international experts' estimates, we refer to the national statistics on broadband market for the latest data. Notably, the World Bank's numbers related to the broadband market can be hardly compared to the numbers from TMT-Consulting Report, since the methodologies of the reports are different.

3303 TMT-Consulting, 'Russian B2C Broadband Market 2018' <<http://tmt-consulting.ru/wp-content/uploads/2019/02/%D0%A2%D0%9C%D0%A2-%D0%BE%D0%B1%D0%B7%D0%BE%D1%80-%D0%A8%D0%9F%D0%94-2018-%D0%BF%D1%80%D0%B5%D0%B4%D0%B22.pdf>> accessed 06 March 2019.

3304 See Section .1. of this Report.

3305 Passport of the National Program 'Digital Economy of the Russian Federation' (n 65).

The major players in both fixed and mobile broadband markets are represented by domestic companies with the share of foreign capital relatively low.³³⁰⁶

Search engines (users). Two companies control Russian search engine market: Yandex and Google. Yandex is the Russian multinational corporation founded in 1997 and owning one of the largest search engines worldwide.³³⁰⁷ According to statcounter.com, in January 2019 Yandex had the largest share in the desktop search engine market (57.49%), followed by Google with 38.15%. However, in the mobile search engine market Google leads competition with 51.07%, while Yandex has 47.49%.

Social networks. Russian companies Vkontakte and Odnoklassniki, both owned by Mail.ru Group, dominate the Russian market of social networks. According to the WCIOM survey, 30% of Russian internet users visit Vkontakte, and 20% use Odnoklassniki.³³⁰⁸ Notably, both of these social networks are among the most popular social platforms in Russia: Vkontakte takes the first place, and Odnoklassniki the sixth place.³³⁰⁹

Under the WCIOM survey, foreign social networks have a modest share of Russian audience: 19% use Instagram, 4% belongs to Facebook, and Twitter has only 1%.³³¹⁰ Nevertheless, the survey shows that the foreign social networks have higher popularity among young Russians. For example, the most popular social network among people 18-24 years old is Instagram (38%). Therefore, Russian companies currently control the market of social networks. However, the share of foreign companies might increase due to young audience.

Online advertising. The size of Russian online advertising market amounts to \$2.09 billion. According to AppNexus, Russian market is among the most rapidly growing digital advertising markets worldwide.³³¹¹ National Yandex.Direct, Vkontakte.ads, myTarget, as well as foreign Google AdWords, and Facebook Ads are the major players in Russian online advertising market.³³¹²

As of the end of 2017, two Russian companies (Yandex and Mail.ru Group) control 66% of the online advertising market, with the share of Yandex amounting to 53%, and the share of Mail.Ru Group (mostly coming from Vkontakte) equal to 14%, according to ACAR study.³³¹³

3313 RBC, 'Experts Estimate the Growth of the Russian Advertising Market in 2017' (20 March 2018) <https://www.rbc.ru/technology_and_media/20/03/2018/5aafd2019a79475c572625fd> accessed 06 March 2019.

Cloud computing. Creating the competitive domestic cloud computing infrastructure to store and process the data is a strategic goal set in Russian legal acts.³³¹⁴ The acts put forward the protectionism policy. Namely, authorities should foster the development and use of Russian cloud computing technology rather than use of foreign R&Ds.³³¹⁵ Moreover, data protection law requires to store all data of Russian users in the territory of the Russian Federation.³³¹⁶

Three sub-markets form digital cloud market: software as a service (SaaS), infrastructure as a service (IaaS), and platform as a service (PaaS).³³¹⁷ Under the TMT-Consulting report, SaaS generate 65%, IaaS generate 31%, and PaaS generate 4% of the Russian digital cloud market revenue in 2017.³³¹⁸ Russian companies dominate both SaaS and IaaS markets. SKB Contour (38%), Mango Office (7%), Softline (7%), B2B-Center (4%), Corus Consulting (4%) own the largest shares in the Russian SaaS market. The major players in the Russian IaaS market are Servionika (11%), DataLine (9%), Rostelecom (9%), ITGrad (8%), and Krok (8%). Russian companies are unlikely to lose their dominant position in SaaS and IaaS markets, due to Russian data protection law requirements mentioned above.

Information about ownership (foreign or domestic, state-owned versus private)

According to the research conducted by the World Bank, domestic companies retain the largest market shares in the Russian markets of social networks, internet access, online advertising, cloud computing, desktop search engines markets, taxi aggregator services.³³¹⁹ On the other hand, Russian markets are characterised by intensive competition among Russian and foreign platforms.³³²⁰ Russian companies face particularly fierce competition from foreign companies in the markets of mobile search engines and online advertising (as demonstrated in the above sections of this Report). The possible reason for the strong position of Russian digital platforms in the local markets is that, from the very start, Russian tech companies were better attuned to the local needs than their foreign competitors. For example, the Yandex search algorithm processed Russian

3320 *ibid* 135.

language requests better than early versions of its international rivals.³³²¹ This enabled Yandex to provide more relevant services to Russian users and gain momentum in winning the market.

State versus private.

Private rather than state-owned companies operate in the Russian digital services markets. For example, Yandex operating in the search engine and online advertising markets is a private company owned by Arkady Volozh (10.2%), employees and company management (4.1%), pre-IPO shareholders (0.8%), with the rest of the equity being free float.³³²² Mail.ru Group active in social networks and online advertising markets is a private company, owned by MIH Mail Investment Company (27,6%), Megafon (15,2%), Tencent (7,4%), and other minority shareholders (49,8%).³³²³

In Russian fixed broadband market, however, the major company, Rostelecom, is partially state-owned, since Russian Federation has 48% stake in it.³³²⁴ Other major players in the Russian fixed and mobile broadband markets (Megafon,³³²⁵ Mobile Telesystem³³²⁶ and Vimpelcom)³³²⁷ are private.

Common ownership by major business players/conglomerates and institutional investors

In the Russian digital market the most prominent example of common ownership is an ownership of three popular Russian social networks, Vkontakte, Odnoklassniki, and Moi Mir by Mail.ru Group. In addition to its own social network Moi Mir, by 2014 Mail.ru Group had acquired two more social media platforms, Vkontakte and Odnoklassniki, which made Mail.ru Group the leader in the social network market.³³²⁸

No other information with regard to common ownership of competitors by conglomerates and institutional investors is available in the public domain. However, there are examples of institutional investors seeking to build a large digital portfolio across many areas. The most telling example is Sberbank, the large state-owned Russian banking and financial services company, whose 50%+1 voting share is owned by the Central Bank of Russia.³³²⁹ In September 2009, Yandex issued one priority share to Sberbank

3329 US SEC, Form 20-F, ANNUAL REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934 for the fiscal year ended December 31, 2017, Section 'Relationship with Sberbank', <<https://yandex.gcs-web.com/>>

for its nominal value of €1.00. This share gives Sberbank the right to block the purchase of more than 25% of Yandex's shareholders' equity and/or votes to a third party, essentially giving to the state decisive control over the ownership structure of the largest Russian tech company³³³⁰ and guaranteeing that 'the company will not fall into foreign control'.³³³¹ Since then Sberbank continued to acquire stakes in various digital companies, including online payment system Yandex.money,³³³² and e-commerce platform on the basis of Yandex.Market with the ambition to create Russian Amazon.³³³³ Since October 2018, there have been rumors that Sberbank was planning to acquire a major (up to 30%) stake in Yandex, thereby creating the full-scale digital ecosystem and implementing its ambition to become the digital company of the global scale.³³³⁴

13.1.7. Local large digital players and their market shares

Russian digital companies are active in the whole array of local markets. According to the World Bank experts, Russian large digital players operate in retail (Wildberries, Ozon, LaModa, Avito, Citilink), tourism (tutu.ru, aviasales), entertainment (afisha.ru, parter.ru), healthcare (prodoctorov.ru), and other markets.³³³⁵ Under the World Bank Report, in 2017 "[T]he revenue of Russian digital platforms exceeds US\$17 billion with a value of about 1 percent of Russian GDP... [I]n total, the market size of foreign digital platforms adds around US\$8 billion to the overall digital platform market in Russia and represents about 30 percent of the overall digital platform market".³³³⁶

The largest players in the Russian digital markets are Yandex and Mail.ru Group. Yandex develops a number of state-of-the-art technologies, including a search engine, Russian-speaking voice assistant, driverless taxi, online marketplace. As mentioned above, Yandex has 57.49% in desktop search engine market. In February 2019 Yandex.Market, online marketplace, and Yandex News were the most visited websites in the Russian Federation.³³³⁷

Mail.ru Group owns three popular social networks in Russia: Vkontakte, Odnoklassniki, and Moi Mir. It is also active in the markets of email services; e-commerce (includes Delivery Club, the largest online food delivery platform in Russia; Youla, domestic marketplace; Pandao, the cross-border ecommerce platform); and has also significant presence in online entertainment.³³³⁸ As of September 2017, Mail.Ru Group ranked first by the size of daily mobile audience, mostly due to its social networks and email services.³³³⁹

The Level of Development of the blockchain economy.

Both government and business community have big expectations about emergence of the blockchain economy in Russia. In 2017 World Bank ranked Russia third globally in terms of number of ICO projects.³³⁴⁰ In terms of fundraising, experts ranked Russia second globally with \$300 million raised by ICO projects in 2017 (though only 3% of them managed to launch the project according to the plan).³³⁴¹ The expert also estimated that the volume of Russian blockchain market was over 1 billion roubles (13,4 million EUR).³³⁴² Experts were less optimistic in 2018 expressing doubts in the potential for a broader adoption of the new technology.³³⁴³ According to EY study, in 2018 token price of 86% ICO start-ups fell below initial value, whilst 30% of start-ups that undergone ICO had almost zero value³³⁴⁴. Moreover, a lot of investors lost their investments.³³⁴⁵

Following this, some international experts, like Christine Lagarde, the Managing Director of the IMF, called for the control over cryptocurrencies.³³⁴⁶ This idea has found support in Russia. Thus, a legislative proposal on digital financial assets³³⁴⁷ regulating tokens and smart contracts, as well as a legislative proposal on crowdfunding³³⁴⁸ passed the first

reading in the State Duma in May 2018, but since then they have been stalled subject to further amendments (which include, *inter alia*, dropping the concept of 'cryptocurrency' out of the bill).

Currently companies and public authorities in Russia are developing some blockchain projects. For example, FAS of Russia considered opportunities to use blockchain technologies for electronic document exchange in cooperation with Sberbank and Aeroflot.³³⁴⁹ FinTech association is developing the Masterchain project to use for financial messaging and mortgage transactions.³³⁵⁰ Sberbank and Alpha Bank are working on prototypes of software intended to manage documents integrity and availability using blockchain.³³⁵¹ The number of projects, however, dropped significantly compared to 2017.³³⁵² Despite expectations and big investments in Russian blockchain market, practical application of blockchain technologies is currently limited to pilot transactions only.³³⁵³

13.2. What is the institutional framework for the digital economy in your jurisdiction?

13.2.1. Is there a digital strategy agenda in your jurisdiction? How this (if at all) relates to competition law and policy and what is the level of involvement of the competition authority (or authorities)?

In 2017 several legal acts set the digital strategy agenda for the Russian Federation. Thus, the Presidential Decree on the 'Strategy for the Development of the Information Society in the Russian Federation for 2017-2030' (hereinafter – '**Information Society Strategy**') identified among its principal aims the development of the digital economy by, *inter alia*, creation of new markets, and achievement of national leadership in the digital markets, as well as increase in competitiveness of the Russian high-tech companies globally.³³⁵⁴ Moreover, the Information Society Strategy emphasized the need to adjust competition law and regulation to the digital age.³³⁵⁵

3354 The Presidential Decree dated 09 May 2017 No 203 on the 'Strategy for the Development of the Information Society in the Russian Federation for 2017-2030'.

3355 *ibid* provision 42 (L).

To implement the Information Society Strategy, the Government adopted the State Programme on 'Digital Economy of the Russian Federation' (hereinafter – the '**State Programme**').³³⁵⁶ Despite the fact that in February 2019, the Passport of the National Programme 'Digital Economy of the Russian Federation'³³⁵⁷ replaced the State Programme,³³⁵⁸ the latter laid the ground for the development of digital economy in Russia in 2017-2018. Moreover, the State Programme played an important role in Russian competition law development, since the State Programme assigned a significant role to the FAS of Russia in adjusting competition law to digital economy.

The State Programme set forth, as the priority goals, creation of the Russian digital economy ecosystem based on data as its key resource, as well as the development of infrastructure and reduction of entry barriers for high-tech businesses.

Regarding competition law, the State Programme prescribed to develop the legal mechanism to facilitate the access of start-ups to the digital markets, including access to the big data, key technologies, etc.; to develop the legal mechanism to prevent algorithmic collusion, as well as other anticompetitive practices in innovation markets; adjust the market analysis, *inter alia*, taking into account concentration of big data as a tool for monopolisation and network effects of the digital platforms.³³⁵⁹ According to the State Programme, FAS of Russia and Ministry of Economic Development were in charge of preparing amendments to competition law (in close cooperation with HSE—Skolkovo Institute for Law and Development, Yandex, Internet Initiatives Development Fund, and Expert Council under the Government of the Russian Federation).³³⁶⁰ In January 2019 FAS of Russia submitted the legislative proposal on these amendments called the 'Fifth antimonopoly package' to the Government of Russian Federation for further consideration.³³⁶¹

The Passport of the National Programme 'Digital Economy of the Russian Federation' does not focus on competition law. However, it sets forth the significant increase of the budget for digital economy development in Russia, creating sustainable and secure high speed telecommunications infrastructure for transmission, processing and storage of big data, as well as preferential development and use of Russian software.³³⁶²

Another important legal act for Russian competition law in the digital age is the Presidential Decree on the 'National Plan for the Development of Competition in the Russian Federation for 2018-2020' (hereinafter – '**National Plan for the Development of**

Competition’).³³⁶³ It sets forth ‘effective prevention of cross-border antitrust violations as well as strengthening the competitiveness of Russian companies in global markets’ as the key goals of competition law reforms in the digital age.

To implement the National Plan for the Development of Competition, the Government of the Russian Federation adopted ‘Roadmap for the Development of Competition in 2018 – 2020’, describing in details further amendments to the competition law required in the digital age.³³⁶⁴

13.2.2. What is protected by property rights (rights to exclude, transfer and monetise)?

Author: Igor Kharitonov

Intellectual property rights in the digital economy

The digital economy tests traditional legal concepts regarding data regulation with new business models and industries. While the vast amount of data is generated by people using the Internet (including social networks), machines with their sensors and the Internet of Things generate industrial data. Since opportunities to capitalize on these data are enormous, the ownership of the data becomes a crucial question. The regulation of data property rights may be a potential answer. At the same time, current legal framework assigns an important role to intellectual property rights and personal data protection. Hence, the questions regarding the data ownership are yet to be answered by scholars and lawmakers. Russia is actively adjusting its economy to the widespread digitalization and recent legislative initiatives can be of some relevance to this debate. Special attention should be paid to the State Programme, the documents adopted in furtherance of it, relevant legislative proposals as well as scholar debates. Such non-profit organizations as ‘Digital Economy’ and Skolkovo Foundation play a key role in this process. The Passport of the Federal Project ‘Normative Regulation of Digital Environment’ of the National Programme ‘Digital Economy of the Russian Federation’ (hereafter – **‘Federal Project on Regulation’**) contains the provisions on forthcoming regulations on the use of data and results of intellectual activity.³³⁶⁵ Besides the state policies related to the emerging data economy, Russian experts and scholars try to provide answers to conceptual issues currently discussed in other countries.

Russian law contains the provisions on intellectual property rights in Part 4 of the Civil Code of the Russian Federation (hereafter – **‘Civil Code’**) that protects the ‘results of intellectual activities’ (intellectual property) relevant to a digital economy, such as com-

3363 The Decree of the President of the Russian Federation dated 21 December 2017 No. 618 ‘On the Main Directions of the State Policy for the Development of Competition’.

3364 ‘Roadmap for the Development of Competition in 2018 – 2020 years’ (n 31), as described in further details in Section 2.6. ‘Recent and Ongoing Reforms of Competition Law’.

puter programs, databases, know-how, and patents, providing IP holders with the exclusive right.³³⁶⁶ Chapter 70 of the Civil Code covers copyright law. According to Article 1259 computer programs are objects of copyright and are protected as literary works. Chapter 71 of the Civil Code covers the neighbouring rights which include, *inter alia*, databases. Chapters 72 and 75 of the Civil Code cover patent law and know-how respectively. It is noteworthy that Russian law separates exclusive rights from property rights.³³⁶⁷ Besides intellectual property rights, the Federal Law 'On Personal Data' dated 27 July 2006 No. 152-FZ (hereafter – '**Law on Personal Data**') is relevant to the case at hand together with the Federal law 'On Commercial Secrets' dated 29 July 2004 No. 98-FZ (hereafter – '**Law on Commercial Secrets**') and the Federal law 'On Information, Informational Technologies, and the Protection of Information' dated 27 July 2006 No. 149-FZ (hereafter – '**Law on Information**').

Rights on Databases

Exclusive rights of database manufacturers were introduced in Russian law with the adoption of Part 4 of the Civil Code. Russian lawmakers relied on the EU Directive 96/9/EC and pursued the goal to provide protection to those who invested in the creation of a database.³³⁶⁸ Database rights (Articles 1333-1336 of the Civil Code) are treated as the neighbouring rights. Elena Voinikanis indicates that the Russian choice of related (neighbouring) rights regime to protect investments in databases is similar to German and Austrian legislation.³³⁶⁹

According to Article 1333 of the Civil Code, a manufacturer of a database whose creation (including the processing or presentation of the relevant materials) requires significant financial, material, organizational or other costs retains an exclusive right to that database. Article 1334 of the Civil Code stipulates that unless proven otherwise, a database whose creation requires significant cost is deemed to be a database comprising at least 10,000 independent information elements (materials). Furthermore, the exclusive right of a database manufacturer is recognized independently of the existence of copyrights and other exclusive rights to materials comprising the database. Article 1335 of the Civil Code sets 15 year term of statutory protection for the rights of a database manufacturer, which is resumed with every database update.

The current widespread use of social networks, where users generate data on their own and thereby fill the networks' databases voluntarily, poses the difficult question of the access to these large data sets for the third parties (for examples, delivering data analytic services). The recent litigation between one of the biggest Russian social networks

3366 Articles 1225 and 1229 of the Civil Code of the Russian Federation.

3367 For example, see on the topic of exclusive and property rights Vitaly Kalyatin, 'On Correlation between Exclusive and Property Rights in the Contemporary Information Society' (2018) 5 *Zakon* 54; (Калятин В.О. О соотношении исключительного права с правом собственности в современном информационном обществе // Закон. 2018. №05).

3369 *ibid* 88-89.

'V Kontakte' and a data analytics company 'DOUBLE,' provides a great source of case law on that topic, as it is one of the first cases connected to database neighbouring rights protection in the context of social networks.

The case had been litigated in both first and appellate instances, before the Court for Intellectual Property Rights returned it to the first instance for a re-trial by its decision dated 24 July 2018.³³⁷⁰ 'V Kontakte' claimed that some information from its social network database was automatically collected, copied and systematized by 'DOUBLE' for commercial purposes since the proprietary technology of 'DOUBLE' allowed, for example, to assess the creditworthiness of borrowers based on this information. 'DOUBLE' capitalized on its technology by selling services to other companies. The court of the first instance dismissed the claims of 'V Kontakte' because the company failed to prove the substantial investment in the creation of a database and the existence of exclusive rights to it. However, the court of appellate instance upheld the claim of 'V Kontakte' and the case went to the Russian Court for Intellectual Property Rights for cassation. Firstly, the Court for Intellectual Property Rights decided that a database manufacturer had no obligation to fill the database himself as he can simply create the conditions for others to fill the database with the data. Secondly, the court indicated that as far as the database at hand comprises much more than 10,000 independent information elements (materials), according to the Article 1334 of the Civil Code creation of such a database is presumed to require significant investments. That means that the defendant ('DOUBLE') has to prove that the costs for assembling a database were not substantial. The court concluded that 'DOUBLE' failed to do that. Thirdly, 'DOUBLE' claimed that 'V Kontakte' invested in the creation and maintenance of a social network, while the creation of a database was not intentional, constituting merely a 'spin off' to its main activity. However, the court ruled that it did not matter for the case at hand. The courts should establish the substantial investments in the creation of a database, not in the creation of data. Thus, the court upheld the decision of the appellate instance that the social network database did exist and 'V Kontakte' had exclusive rights to it by the virtue of being its manufacturer. Lastly, the court addressed the claim of 'V Kontakte' regarding the violation of its exclusive rights by 'DOUBLE'. It appeared that lower courts failed to assess how the proprietary technology of 'DOUBLE' allowed the company to extract and use the data of 'V Kontakte'. As a result, the case went for re-trial to the lower court.

The case encouraged the discussion on the data ownership in the context of digital economy and social networks. For example, a representative of 'DOUBLE' Evgeny Oreshin claimed that company's technology operated in the same way as search engines like Yandex and Google by allowing its clients to search the information on people from open sources.³³⁷¹ Additionally, he pointed out that allowing social networks to have a

3370 Decision of the Court for Intellectual Property Rights on the case № A40-18827/2017 dated 24 July 2018 <http://kad.arbitr.ru/PdfDocument/1f33e071-4a16-4bf9-ab17-4df80f6c1556/4c9d2b02-4fbd-4554-82c8-53282523639c/A40-18827-2017_20180724_Reshenija_i_postanovlenija.pdf> accessed 3 March 2019.

3371 See Evgeny Oreshin, 'The Case Vkontakte VS DOUBLE on the Use of Open Users' Data: Position of DOUBLE in the Court for Intellectual Property Rights' (Zakon, 15 June 2018). <https://zakon.ru/blog/2018/6/15/delo_vkontakte_vs_dabl_ob_ispolzovanii_obschedostupnyh_dannyh_polzovatelej_poziciya_dabl_v_sude_po_i> accessed 3 March 2019.

monopoly on users data could lead to negative effects, especially for competition.³³⁷² Lawyers found the similarities between this case and the case *HiQ Labs v. LinkedIn* where the US court rejected demands of LinkedIn to prohibit HiQ to automatically collect open data of LinkedIn users because such prohibition would empower big companies and endanger the free exchange of information in the Internet.³³⁷³

Recently, this issue has been discussed again, but on the level of legislative initiative. The Russian journal *Kommersant* wrote about a new legislative proposal on the use of social networks users data, which was prepared by the non-profit organization 'Digital Economy'.³³⁷⁴ According to this proposal, social networks would have to notify users about the level of privacy provided by the network and, if it is an open network, users data would become accessible to everybody. However, if a social network provides confidentiality settings allowing users to close their accounts, such social network is obliged to protect users private data.³³⁷⁵ The proposed legislation is motivated by the risk of monopolization of data by internet platforms. 'V Kontakte' opposed to this legislative initiative claiming that it endangers confidentiality of users data as it allows any third parties to collect data without permission and favour the interests of personal data brokers.³³⁷⁶

Hence, the way in which rights to databases will adjust to social networks activity is yet to be decided in Russia. The upcoming final court ruling on the 'V Kontakte' case and legislation, that will be enacted based on the 'Digital Economy' initiative may provide a legal basis to settle this issue in future.

Rights on Personal Data

There is a debate in Europe regarding the introduction of property rights on personal data.³³⁷⁷ However, currently personal data is not covered by property rights and instead is regulated by the personal data protection provisions. Russian legislation is no different in this respect. Thus, Chapter 2 of the Law on Personal Data is dedicated to the principles and requirements for personal data processing, Chapter 3 covers the rights of a personal data subject, and Chapter 4 regulates the obligations of an operator.

Compared to the European approach, provision of the GDPR on data portability is not represented in the Law on Personal Data.³³⁷⁸ On the other hand, the Law on Personal

3377 For example, see Nadezhda Purtova, 'Do Property Rights in Personal Data Make Sense after the Big Data Turn?' (2017) 21 *Tilburg Law School Legal Studies Research Paper Series 1*, <https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3070228> accessed 3 March 2019.

3378 Evgeny Guk and Artem Dmitriev, 'GDPR: What Should Russian Business Know?' (PwC, 12 September 2017) 11 <<https://www.pwc.ru/ru/events/assets/gdpr-review.pdf>> accessed 3 March 2019.

Data is similar to the GDPR in regard to the processing of data only for the declared purposes.³³⁷⁹

According to Article 5.8.7 of the State Programme by the end of 2019 property rights to the data created by users of the internet should be legally separated from data created by the use of the Internet of Things.³³⁸⁰ For example, Elvira Talapina considers this proposition as an application of property rights regime to users personal data.³³⁸¹ Besides, the Federal Project on Regulation states that the Law on Personal Data and other laws should be amended in 2019 in order to clarify the process of personal data anonymization, terms and conditions of its use, the procedure for getting a user consent, and obligations to maintain the data security.³³⁸²

Recently Russian lawmakers have come up with the draft amendments to the Law on Information to regulate big data.³³⁸³ Among some important provisions of the amendments, Article 1(2) introduces a term 'big personal data' as an anonymized data on people and their behaviour collected from different sources including the internet. Additionally, Article 1(2) introduces the concept of an 'operator of big personal data' and Article 12³ covers the creation of the register of operator of big personal data. The amendments have not been supported by the government authorities, in particular Roskomnadzor, and business community.³³⁸⁴ The Legal Department of the State Duma, in turn, concluded that the additional resolution of Russian government is needed.³³⁸⁵ As a result, the State Duma Committee on Informational Policy, Technologies and Communications returned the bill back to the originators of the proposal.³³⁸⁶

Besides the above-mentioned legislative initiatives, the debates of who should own personal data are currently underway in Russia. For example, Natalya Kasperskaya proposed that 'big personal data' of Russian users should be owned by the state, because these days such data was easily accessible to foreign companies.³³⁸⁷ In her opinion, the way the Chinese government and Facebook cooperate is an example of how it should be done.³³⁸⁸ Such a radical position is motivated by the concern for state sovereignty

3379 *ibid* 10.

3380 However, since the State Programme was replaced by the Passport of the National Program in February 2019, the further implementation of such initiative is unclear.

3388 *ibid*.

on the Internet, privacy of users and their data security.³³⁸⁹ Current political tensions between Russia and Western countries may further fuel these ideas.

However, a business perspective on the use of personal data is different. The draft amendments to the Law on Personal Data, which have been proposed by the business community, provide companies with additional rights to users data.³³⁹⁰ More specifically, companies are now allowed to share data with third parties, and while users are entitled to know who these parties are, they have no right to stop such sharing.³³⁹¹ Additionally, companies gain the right to process data for goals to which users have not necessarily consented.³³⁹² However, such amendments have not become a law yet. Federal Project on Regulation also provides for the future amendments to the Civil Code, the Law on Information and other laws in order to set the rules for access to publicly available data in terms of clarifying the procedure of depersonalization of personal data, the conditions and procedure for their use, as well as the procedure for obtaining consent and protection of rights and interests of citizens.³³⁹³

Rights on Industrial Data

Besides people who actively use the Internet and generate a vast amount of data, machine sensors and the Internet of Things are also the sources of what can be called 'industrial data'. The protection of such data in the digitalized economy is becoming an issue these days.

The Higher School of Economics prepared the Report on the regulation of data as a part of the National Programme 'Digital Economy of the Russian Federation'.³³⁹⁴ They examined the issue of property rights on industrial data and concluded that exclusive rights on databases were not fully applicable to the case at hand. The collection of raw data generated without human participation does not constitute an original work in the sense of copyright, and investments into equipment which generates industrial data are unlikely to be considered as investments in the database creation. This prevents protection of machine-generated data by means of exclusive neighbouring right.³³⁹⁵ The authors also think that protection of trade secrets does not apply to industrial data as third parties can have indirect access to such data and the cost of maintaining secrecy may

3395 *ibid.* 94.

be disproportionately high.³³⁹⁶ Finally, the researchers took the conceptual position that there was no need to introduce property rights to information, because the 'absolute protection provided by the property right does not meet the needs of free flow of information and fair use of data in public interests'.³³⁹⁷ The report suggests that an owner of industrial data can prevent unauthorized access to it by taking appropriate technical measures and can exchange such data with third parties relying on contract law.³³⁹⁸

Hence, industrial data is not covered by any special legal regime, but the provisions of the Passport of the National Program 'Digital Economy of the Russian Federation' can result in some legislative initiative or some solution connected to contract law as it is proposed by the above scholars.

Rights on Algorithms

Referring to the European experience, the issue of property rights on algorithms has been addressed by the researchers at the Max Planck Institute for Innovation and Competition who concluded that the existing limitations on copyright protection and patentability of algorithms used in data processing were justified by the need to ensure the free flow of information and effective competition in data markets. That means that there is no need to introduce a special protection of algorithms.³³⁹⁹

Similar to European law, the current Russian legislation allows limited protection of computer algorithms. According to the Civil Code computer programs are protected in the same way as copyrights to literary works, but algorithms are not covered by computer program copyright protection as they represent ideas and principles on which the program is based.³⁴⁰⁰ At the same time, computer programs are not patentable.³⁴⁰¹ Hence, the question is whether algorithms can be covered by patents. Some legal experts suppose that algorithms are patentable under existing Russian laws.³⁴⁰² Others claim that as AI becomes more developed, the algorithms, architecture and functionality of a computer program, rather than its source code, become more important and, therefore, can be potentially covered by the 'software' patents.³⁴⁰³ Referring to Russian

3400 Articles 1259 and 1261 of the Civil Code of the Russian Federation.

3401 Article 1350(5) of the Civil Code of the Russian Federation.

3402 See for example, Kristina Zaytseva 'Possible Solutions for Legal Protection of Software' (Zuykov and Partners, 26 December 2017) <<https://zuykov.com/ru/about/articles/2017/12/26/vozmozhnye-varianty-pravovoj-ohrany-programmnogo-o/>> accessed 3 March 2019.

3403 See G.A.Akhmedov and others, 'Main Trends in the Development of Intellectual Property Rights These Days, Including New Intellectual Property Objects and Global Protection' (RVK, 2017) 56 <https://www.rvc.ru/upload/iblock/85d/Trends_in_Intellectual_Property.pdf> accessed 3 March 2019.

case law, the Court for Intellectual Property Rights in its decision on the case No. СИП-789/2016 dated 8 June 2018 stated that while computer program could not be patented, its algorithm could if it is represented as a consequence of actions on signals (material object) which leads to technical results performed by computational equipment as it constitutes a technical solution.³⁴⁰⁴

By the mid-2019 the Federal Project on Regulation envisages the adoption of amendments to the Civil Code and other Russian laws in order to modernize the rules for circulation of rights on computer programs.³⁴⁰⁵ The goal of this legislative initiative is to eliminate legal uncertainty regarding the circulation of rights, to clarify such terms as 'program' and 'software', to identify the key characteristics of circulation of rights on computer programs, to secure equal legal protection of different computer programs types, to provide freedom of parties to choose the type of contract for the circulation of rights on software used in cloud computing services.³⁴⁰⁶

According to Article 1(14) of the draft amendments to the Civil Code which are published on the Skolkovo website, Article 1350 ('The Conditions for Patentability of an Invention') should be expanded by adding a provision that a patentable invention may include a solution of a technical problem or an achievement of a technical result by performing a sequence of actions carried out with the help of computational equipment, including a computer program.³⁴⁰⁷ This amendment can be interpreted as being applied to algorithms.

13.2.3. Succinctly present the current regulatory framework in your jurisdiction

Author: Daria Kotova

The following succinct outline of the current regulatory environment in Russia includes description of the competition aspects of the regulations on electronic communications, access to data, digital consumer protection, and privacy and data protection. These regulations either directly aim at protecting competition or can have an impact on the competition when enforced.

The regulation of electronic communications is primarily based on the Law 'On Communications' and normative acts adopted on its basis.³⁴⁰⁸ This law contains provisions related to protection of competition in the communication markets, including access regulation and prices/rates regulation. Thus, Article 18 of the Law on Communications

3404 Decision of the Court for Intellectual Property Rights on the case No. СИП-789/2016 dated 8 June 2018 <<http://www.garant.ru/products/ipo/prime/doc/71864692/?prime>> accessed 3 March 2019.

3405 See Passport of the Federal Project 'Normative Regulation of Digital Environment' (n 201) Point 01.01.004.001.

3406 *ibid.*

3407 See the link 01.01.004.001 'Legislative Proposal to Amend Part 4 of the Civil Code' establishing the rules for circulation of rights to computer programs <<https://sk.ru/foundation/legal/p/04.aspx>> accessed 3 March 2019.

3408 The Federal Law 'On Communications' dated 7 July 2003 No. 126, <https://rg.ru/2003/07/10/svjaz-dok.html>, accessed 13 February 2019, and the Decree of the Government of the Russian Federation dated 28 March 2005 No. 161.

regulates granting the access to the shared communications network and provides for special contract terms in cases where a communications operator occupies a significant position in the shared communications network (hereinafter – ‘**Operator with Significant Position**’). Importantly, the definition of an Operator with Significant Position given in the Law on Communications differs from the dominant position described in competition law. An Operator with Significant Position is an operator that owns (including affiliates) not less than 25% of the installed capacity or has the ability to transmit not less than 25% of the traffic in a specific territory or in the entire territory of the Russian Federation.³⁴⁰⁹ This criterion is lower compared to the definition of dominance (which is presumed for the entities owning over 50% market share) in competition law.³⁴¹⁰ The Order of the Ministry of Digital Development, Communications and Mass Media dated 19 May 2005 No. 55 sets forth an additional form of control over Operators with Significant Position.³⁴¹¹ This order establishes the register of Operators with Significant Position maintained by a responsible executive body, which is the Federal Service for Supervision of Communications (Rossvyaznadzor).

Regarding access to communication networks, Article 19 of the Law on Communications clarifies requirements for Operators with Significant Position owning the shared communication network, in cases where other operators wish to access it. The general rule is that in order to prevent discrimination in the communications market, the Operator with Significant Position must offer the same conditions of entering the market (access to the shared communication network) as it does for its affiliated operators.³⁴¹² This Article also contains a number of restrictive and controlling provisions aimed at protecting the competition in the communications market. For instance, an Operator with Significant Position cannot refuse to enter into an agreement with an operator delivering similar services except for cases when access to the shared communications network contradicts the operator’s license or regulations on network integrity.³⁴¹³ An interesting example of the case where an Operator with Significant Position refused to deal with another operator unless certain conditions were included in the agreement is the case of *Sovintel v. CenterTelecom*. In this case, Sovintel complained to FAS of Russia that CenterTelecom, the Operator with Significant Position, insisted on including restrictive terms in the agreement that could limit Sovintel’s ability to transmit certain types of traffic. Although FAS of Russia found that CenterTelecom’s actions were in breach of the Federal Law ‘On Protection of Competition’, higher courts reversed this decision.³⁴¹⁴ The Supreme Commercial Court of the Russian Federation stated that FAS of Russia failed

3412 Article 19(1) of the Federal Law ‘On Communications’.

3413 *ibid* Article 19(2).

3414 Decision No. 2393/11 of the Presidium of the Supreme Commercial Court of the Russian Federation on the case No. A40-6002/10-154-15 dated 6 September 2011, <http://arbitr.ru/bras.net/f.aspx?id_casedoc=1_1_f4ae5c0e-b041-4a52-b23f-85ca67a5eab2>, accessed 28 February 2019. For the more detailed information on the case, please refer to the relevant individual fiche.

to prove abuse of dominance and pointed out that Operators with Significant Position were entitled to change access terms if required by the technological changes in the communications network.

To ensure non-discrimination in access terms, the Law on Communications provides further controlling mechanism. Thus, after an Operator with Significant Position establishes its terms for access to the shared communication network, it must publish these terms and send them to the relevant federal agency – the Ministry of Digital Development, Communications and Mass Media of the Russian Federation (hereinafter – **‘Ministry of Digital Development’**).³⁴¹⁵ In case of any discrepancy between the access terms of the Operator with Significant Position and the access rules adopted by the federal government, the Ministry of Digital Development can issue a warning, with which the Operator with Significant Position shall comply within 30 days. Finally, an Operator with Significant Position has 30 days to review other operators’ access applications and shall enter into an access agreement within 90 days from the receipt of an application. According to Article 20 of the Law on Communications, the prices for access communication services provided by Operators with Significant Position are regulated by the state through setting the maximum and (or) minimum prices for access and traffic transmission.³⁴¹⁶ All these restrictions and control measures are aimed at preserving non-discriminatory environment in the market of electronic communications in Russia.

Interoperability of the communications networks is set, *inter alia*, in Article 12 of the Law on Communications, which defines what constitutes the single telecommunication network of electronic communications in the Russian Federation, and what are organizational and technical requirements for operators of all categories of communication networks aimed at its integral and stable functioning.³⁴¹⁷ In particular, operators of the shared communication network should preserve its integrity. The latter means ‘the ability of its network components to interact, which enables to establish a connection and (or) transfer information between users of the relevant communication services’³⁴¹⁸ (i.e. interoperability of all components of the shared network). The shared communication network integrity is implemented through, *inter alia*, ‘compatibility of interaction protocols (interoperability) and compatibility of electrical and/or optical interfaces (physical compatibility) of communication facilities’.³⁴¹⁹ Interoperability and physical compatibility

3415 For the purposes of Article 19 of the Federal Law ‘On Communications’, the relevant power is conferred to the Ministry of Digital Development, Communications and Mass Media of the Russian Federation. The Ministry has the competence over the functioning of electronic communications according to the Statute on the Ministry of Digital Development, Communications and Mass Media adopted by the Decree of the Government of the Russian Federation No. 418 dated 2 June 2008 <<https://digital.gov.ru/uploaded/files/polozhenie-o-minkomsvyazi.pdf>> accessed 28 February 2019.

3416 See Paragraph 3 of the ‘State Regulation of Prices for Access and Traffic Transmission Services Provided by Operators Occupying Significant Position’ approved by the Decree of the Government of the Russian Federation dated 19 October 2005 N 627.

3417 Article 12 of the Federal Law ‘On Communications’.

3419 *ibid* para 3.

is ensured by complying with the requirements established in the rules of use of communication devices,³⁴²⁰ set forth by the relevant federal agency.³⁴²¹

Access and interoperability rules are strengthened by the so-called 'rules of non-discriminatory access' issued by the Government of the Russian Federation and developed with the participation of FAS of Russia. For instance, the Decree of the Government of the Russian Federation dated 29 November 2014 No. 1284 establishes the rules with respect to electronic communications infrastructure.³⁴²² This Decree defines non-discriminatory access to infrastructure as equal infrastructure access for all users regardless of their legal status or relation to the infrastructure owner. However, non-discriminatory access permits the use of differentiated access terms when differentiation is technologically and economically justified.

In principle, the owner cannot deny access to infrastructure to any user given the owner has the necessary economic and technological capabilities.³⁴²³ Access to infrastructure cannot be bundled with other paid services or access to any other object of infrastructure.³⁴²⁴ In addition, the owner must set equitable rates for all infrastructure users although these rates can be differentiated depending on the number of infrastructure objects, period of their use and technological characteristics of access.³⁴²⁵ All violations of the above rules are subject to the competition authority's review. In addition, general rules of non-discriminatory access to infrastructure may soon be supplemented by the rules of access to infrastructure placed in residential buildings. This might solve the issue of house management companies restricting the access to telecommunication infrastructure within residential buildings, which leads to significant differences in prices for telecommunication services. The relevant proposal is under discussion in the State Duma.³⁴²⁶

As for network neutrality, this principle is not formally established in Russia yet, although debates on network neutrality are ongoing. For instance, the Council on Data Economy recommended formalizing this principle in law. Its proposal was upheld by FAS of Russia.³⁴²⁷ More precisely, FAS of Russia developed network neutrality principles to ensure its smooth application in the market.³⁴²⁸ These principles included non-discriminatory treatment of data, information or applications regardless of whether they are originated by an operator, its affiliates or third parties, as well as cooperation between mar-

3428 'FAS Developed Basic Document on Network Neutrality Principles in the Russian Federation' <<https://fas.gov.ru/publications/1630>> accessed 28 February 2019.

ket actors aimed at satisfying consumer demand and reasonable control of traffic.³⁴²⁹ However, the Russian government later rejected the initiative since, in their view, the antimonopoly regulation already had efficient instruments to deter discrimination in the communications market (for example, prohibition of unfair competition and abuse of dominance).³⁴³⁰ Therefore, absent specific regulation, competition law is currently in charge of ensuring non-discriminatory treatment of all internet traffic in Russia.

As for **the access to data, access to algorithms/smart data** and the **general use of algorithms**, there is currently no specific regulations in Russia. The general legal framework includes the Federal law 'On Information, Information Technologies and the Protection of Information' dated 7 July 2006 No. 149-FZ (hereinafter – '**Law on Information**') that provides the general regulation of data flows in Russia. For instance, Article 10.3 of the Law on Information regulates the obligations of search engines, Article 10.1 regulates the activity of the so-called 'organizers of information dissemination',³⁴³¹ which include web-sites and other resources that have been added to a special register by the Federal Security Service. Other provisions of the said law regulate the obligations of news aggregators (Article 10.4), overall dissemination of information (Article 10) and certain cases of restriction of access to the information disseminated in breach of intellectual property rights and data protection requirements. This law is supplemented by a variety of executive acts that further clarify its implementation.

Nonetheless, even without explicit legislative provisions, Russian authorities understand importance of these technological developments for the digital economy as emphasized in the National Programme.³⁴³² Thus, the objective to conceptualize a regulatory toolkit for the new digital economy may include the regulation of digital technologies relevant for the competition.³⁴³³ An example of such regulatory change is the initiative to amend the current Federal Law 'On Protection of Competition' to include provisions on pricing algorithms and network effects generated by digital platforms.³⁴³⁴

Interestingly, despite the move towards regulation of new digital technologies, the Administration of the Russian President has raised concerns about self-regulation of Big Data as proposed by the industry and favored the state regulation to ensure stronger protection against data-driven monopolization.³⁴³⁵

3429 Reasonable control of traffic means that traffic can be managed in certain cases. For instance, control of traffic can be used in cases of emergencies and overloads, to prevent cyber-attacks, to preserve security of communication and of personal data and also in cases addressed in federal laws.

3430 Valery Kodachigov, 'The Government Will Not Legislatively Defend Network Neutrality' Vedomosti (Moscow, 28 October 2018) URL: <https://www.vedomosti.ru/technology/articles/2018/10/28/784901-pravitelstvo-zakonodatelno-zaschischat-neitralnost>, accessed 25 February 2019.

3431 This category of web-resources was introduced by an amendment to a number of federal laws and regulations in 2016 as a part of a greater reform of Russia's Internet law aimed at restricting the Internet environment for the sake of national security. According to these regulations, organizers of information dissemination must keep the information on user communication for one year and provide access to this information to the specified national security authority.

3432 Passport of the National Program 'Digital Economy of the Russian Federation' (n 65).

3433 *ibid.* 1.19.

3434 See Section 2.6. 'Recent and Ongoing Reforms of Competition Law'.

3435 Svetlana Yastrebova, 'Presidential Administration Insists on Big Data Regulation' Vedomosti (Moscow, 21 Novem-

An example of problems caused by the lack of access to data regulation is the recent litigation between Vkontakte and DOUBLE (see Section 'Rights on Databases' of this Report). The official stance of the courts in this case may have important repercussions for access to data in the digital markets as granting to the database owner an exclusive right to data created by users may serve as a significant barrier to competition.

Digital consumer protection is mainly provided by the Federal law 'On the Protection of Consumers Rights' dated 7 February 1992 No. 2300-1.³⁴³⁶ This law was amended in 2018 in order to include consumer protection obligations for online aggregators that engage in b2c sales of goods and services.³⁴³⁷ The amended law obliges both aggregators and sellers to provide the certain information (such as name, address, working hours, etc.) to consumers.³⁴³⁸ In addition, Article 26.1 of the said law regulates consumer protection applicable to online sales. This provision is strengthened by the Decree of the Government of the Russian Federation dated 27 September 2007 No. 612 that further elaborates on protection of consumers rights in e-commerce.³⁴³⁹ In particular, sellers must give consumers the basic information about the good upon delivery,³⁴⁴⁰ provide information about the good they sell remotely.³⁴⁴¹ In addition, consumers have certain ways of protecting their rights in case of delivery issues.³⁴⁴²

Apart from the general consumer protection regulation, rights of digital consumers can be protected through specific instruments designed for digital markets. Thus, consumer rights in the market of telematics communications are protected by the binding rules issued in compliance with the law on consumer protection.³⁴⁴³ These rules specify the procedural and material aspects of a contract concluded between an operator and a consumer and thoroughly regulate the prices (tariffs) of the services of telematics communications. They also deal with the issue of spamming by obliging operators and consumers to prevent dissemination of spam messages through their infrastructure or, for consumers, through their user terminals. Similar rules are set forth for consumer protection in the market of non-internet communications.³⁴⁴⁴

ber 2018) < <https://www.vedomosti.ru/technology/articles/2018/11/21/787110-administratsiya-nastaivaet-gos-regulirovanii-bolshih-dannih>> accessed 28 February 2019.

3440 *ibid* Article 9.

3441 *ibid* Article 17.

3442 *ibid* Articles 22-29.

3443 The Decree of the Government of the Russian Federation dated 10 September 2007 No.575 'On Approval of the Rules for the Provision of Telematics Communication Services' <<https://rg.ru/2007/09/25/svyaz-pravila-dok.html>> accessed 15 February 2019.

3444 The Decree of the Government of the Russian Federation dated 23 January 2006 No.32 'On Approval of the Rules for the Provision of Data Transmission Services' <<https://rg.ru/2006/02/03/svyazj-pravila-dok.html>> accessed 15 February 2019.

Furthermore, the Federal law 'On Advertising' dated 13 March 2006 No. 38-FZ regulates advertising practices with the view to preventing violation of consumer rights while safeguarding competition that can be seriously compromised by unfair advertising. Thus, the law prohibits certain advertisements that can be considered as an act of unfair competition, as well as false advertisements.³⁴⁴⁵ In case of advertising via phone, Internet or radio communication, advertisements can only be transmitted with the user's prior consent.³⁴⁴⁶ Automated calling and automated distribution of advertising are prohibited.³⁴⁴⁷ The law grants certain supervisory powers over advertising to FAS of Russia, which has delivered its opinion on the antimonopoly aspects of advertising in digital markets in the numerous informational letters.³⁴⁴⁸ Moreover, the competition authority has often imposed fines for violations of the Federal law 'On Advertising' in the digital markets. For instance, in August 2018, FAS of Russia found major telecom operators and online shops in breach of the Federal Law 'On Advertising' for unlawful use of instant messaging in advertising.³⁴⁴⁹ Taxi aggregator Yandex was fined in 2018 for false advertising. The company advertised the low price for a taxi drive, while the text of advertisement clarified in the small low-case font that the advertised price included just provision of a taxi cab, but not the actual drive.³⁴⁵⁰

Privacy and data protection in Russia are mainly covered by the Law On Personal Data that provides the normative basis for the process of personal data collecting, storing and processing.³⁴⁵¹ This law has a special provision that data processing aimed at goods and services promotion is lawful only with the prior consent of the subject of personal data.³⁴⁵² This may prevent companies from purchasing user databases and obtaining personal data to use it for promoting their business.

This is illustrated by a lawsuit where the National Bureau of Debt Records collected data from social media to detect potential consumers of its financial services. However, the data was collected without the prior consent of data subjects and the regulator issued a warning. This warning was appealed by the National Bureau of Debt Records, but the appeal was rejected. The Supreme Court of the Russian Federation confirmed lower courts' rulings that the respondent violated the law on personal data³⁴⁵³ and agreed

3452 *ibid* Article 15.

3453 Order of the Supreme Court of the Russian Federation No. 305-KG17-21291 on case No. A40-5250/2017 dated 29 Janu-

with the lower court's reasoning that the data published in social media do not become automatically available to anyone.³⁴⁵⁴ This case illustrates the potential that data protection legislation has for Russian emerging digital economy and, at the same time, calls for a legislative watershed between the lawful and unlawful use of personal data for marketing purposes, especially, in the light of the crucial role that personal data play for competition in the digital markets.

Competition considerations are embedded in many regulations in Russia that govern various aspects of digital economy and digital markets. While some of the recent technological developments, such as Big Data or AI, are not expressly regulated by the state yet, the potential of state regulation of the nascent areas of digital economy is subject to ongoing discussion. Importantly, the national competition authority often takes a lead in this discussion and comes up with proposals on the most cutting-edge aspects of digital competition.

13.2.4. Institutional architecture

The institutional architecture of the digital economy regulation in the Russian Federation was initially shaped by the State Programme "Digital Economy of the Russian Federation" adopted by the Decree of the Government of the Russian Federation dated 28 July 2017 № 1632-p, further repealed³⁴⁵⁵ and substituted with the Passport of the National Programme 'Digital Economy of the Russian Federation' (the '**National Programme**').³⁴⁵⁶ The National Programme does not indicate a specific digital platforms regulator, but specifies that the Ministry of Digital Development leads the implementation of the National Programme. The Government of the Russian Federation further allocated the specific functions on implementation of this Programme among several agencies, with the main responsibility assigned to the Ministry of Economic Development of the Russian Federation (hereinafter – '**Ministry of Economic Development**') and the Ministry of Digital Development.³⁴⁵⁷

Ministry of Digital Development is the federal executive body subordinate to the Government of the Russian Federation and responsible for implementation of "Digital Technologies", "Digital State Governance", "Information infrastructure" and "Information security" sections of the National Programme. Its key responsibilities include regulation in the following areas:

- information technology (including creation of state information resources and providing access to them);
- telecommunications and postal services;

ary 2018.

3454 Decision of the 9th Court of Appeals No. 09АП-31744/2017 on case No. A40-5250/17 dated 27 July 2017.

3455 The Decree of the Government of the Russian Federation dated 12 February 2019 №195-p.

3456 Adopted by the protocol of the Presidium of the Presidential Council for Strategic Development and National Projects dated 24 December 2018 No. 16.

3457 The Decree of the Government of the Russian Federation dated 02 March 2019 №234.

- mass communications and mass media, including electronic (such as the internet, television (including digital) and radio broadcasting and new technologies in these areas);
- printing and publishing industry;
- personal data processing.³⁴⁵⁸

Ministry of Digital Development has extensive powers in the IT-area and monitoring of the internet safety. The Ministry is also responsible for digitalization of state institutions and national corporations, creation of public informational platforms and promotion of equal access to informational platforms in other industries, and creation of the common digital trust environment in the EEU and the CIS countries.³⁴⁵⁹ The Deputy Minister of Digital Development has proclaimed that “the main function of the ministry is to create favourable environment for the digital transformation, not to exercise control and supervision”.³⁴⁶⁰

Ministry of Economic Development is the federal executive body subordinate to the Government of the Russian Federation and responsible for implementation of “Normative Regulation of the Digital Environment” and “Personnel for Digital Economy” sections of the National Programme. It has a wide range of powers including formalization of the whole package of new regulations in the field of digital economy. The Ministry is responsible for general coordination of all emerging areas of the new economy and, as of the end of 2017, planned to draft more than 50 bills related to creating a common digital trust environment; regulation of data protection; introduction of innovation to financial markets including regulation of cryptocurrencies and digital assets; regulation of crowdfunding and crowdinvesting activities using investment platforms; introduction of economic and tax incentives for companies driving economic digitalization, etc.³⁴⁶¹

The consumer protection in the field of digital economy falls within the competence of the **Federal Service for Supervision of Consumer Rights Protection and Human Welfare** (hereinafter – ‘**Rospotrebnadzor**’), which is accountable to the Government of the Russian Federation. Rospotrebnadzor conducts systematic work aimed at improving consumer protection in the new realities of the digital world, both at the national level and at international fora. This includes drafting and applying legislation regarding the regulation of platforms that aggregate information about goods or services,³⁴⁶² as well as devising common approaches to consumer protection in the context of e-commerce

3462 Amendment of the Law of the Russian Federation ‘On Protection of Consumer Rights’ enacted by the Federal Law dated 29 July 2018 N 250-FZ.

in the EEU and the CIS countries. The main focus of Rospotrebnadzor is increasing the level of protection of consumer rights online.³⁴⁶³ To implement this, Rospotrebnadzor has a number of powers, including conducting sector inquiries, formal investigations and imposing sanctions against enterprises violating consumer protection law.³⁴⁶⁴ Thus, in 2017 Rospotrebnadzor conducted inquiry into 1000 most popular online shops in Russia, which revealed that over 25% of the online retailers has violated at least one of the consumer protection requirements.³⁴⁶⁵

The **Ministry of Finance of the Russian Federation** is another federal executive body accountable to the Government of the Russian Federation, which is responsible for the regulation of the use of digital technologies in the financial sector.³⁴⁶⁶ For example, together with the Central Bank it prepared the bill 'On Digital Financial Assets' that is intended to regulate issuance and circulation of crypto assets, as well as establish procedural requirements for ICO and protection of the rights of investors in crypto assets.³⁴⁶⁷

The **Central Bank of the Russian Federation** is an independent public institution, not subordinate to the government, and has as its objectives ensuring the stability of the rouble; development and strengthening of the banking system of the Russian Federation; ensuring stability and development of the national payment system; development of the financial market of the Russian Federation and ensuring its stability.³⁴⁶⁸ In February 2018 the Central Bank issued an extensive document 'The Main Directions of Development of Financial Technologies for the Period 2018-2020'.³⁴⁶⁹ According to this document, the main objectives of the Central Bank in this area are 'promoting competition in the financial markets, improving the availability, quality and range of financial services, reducing risks and costs in the financial sector, as well as improving the competitiveness of Russian technologies in general'.³⁴⁷⁰ According to this programme, the Central Bank will perform:

3470 *ibid* 6.

- regulation of the new financial technologies (including creation of the ‘special regulatory platforms’ (a sort of ‘sandbox’);
- research, analysis and suggestions for application of new technologies like Reg-Tech, SupTech, Big Data and Smart Data, DLT, AI, mobile technologies, open APIs, etc.;
- creation and development of the financial infrastructure (including platforms for remote identification, fast payments, a platform-marketplace for financial products and services, as well as new platforms based on distributed ledgers and cloud technologies);
- transition to electronic interactions between the central bank, other public bodies and participants of financial markets, including more extensive use of a digital signature;
- ensuring safety and sustainability in the application of financial technologies, etc.³⁴⁷¹

To summarize, Russian digital landscape is characterised by a plethora of sectorial regulators, each devoted to its specific domain of expertise, with their powers sometimes vague and overlapping. Therefore, coordination through working groups and interdepartmental meeting bears special importance in regulating the nascent digital economy.³⁴⁷²

The **Federal Antimonopoly Service of the Russian Federation** (**‘FAS of Russia’**) as a national competition authority plays a prominent role in monitoring and ensuring the protection of competition in the digital markets. The task of FAS of Russia is protection of competition and creation of favourable conditions for competition in the digital markets.³⁴⁷³ This task is performed through various instruments including investigation of abuse of dominance and concerted practices; control on economic concentration; control on the fairness and transparency of the actions and agreements of public authorities; etc. In addition, it performs control over the public procurement procedures (including electronic tenders) and oversees compliance with the regulations on advertising activities, including those performed online.³⁴⁷⁴

In the digital age FAS of Russia is updating its institutional framework, for example, by introducing the novel institute of a “trustee” in the ‘Fifth antimonopoly package’.³⁴⁷⁵ This is an organisation independent from both FAS Russia and the company, which helps

the company comply with the requirements of the competition authority (mostly as a condition of approval of the economic concentration, as well as in abuse of dominance cases).³⁴⁷⁶ The institute of a trustee can be described as one of the forms of monitoring of antitrust compliance.³⁴⁷⁷ Though the institute of a trustee is not set forth on the legislative level yet, the first case of an independent expert's involvement in execution of the antimonopoly decision is *Bayer / Monsanto* merger. The transfer of technology in this case is coordinated by the Center for Technological Transfer on the basis of the Higher School of Economics.³⁴⁷⁸

The **courts of the Russian Federation** play an important role in application of competition law and sector-specific regulations through individual cases review and general interpretation of normative acts, with the power to strike down any normative or administrative act which is not compliant with the Russian law or the Constitution.³⁴⁷⁹ The Supreme Court of the Russian Federation is the highest judicial body for resolution of economic disputes, civil, criminal, administrative and other cases, which performs the final judicial review of the activities of lower courts and gives clarifications on judicial practice.³⁴⁸⁰ It often has the final say in the competition-related disputes that further shapes the position of the competition authority.³⁴⁸¹

Interaction between Competition Law and Regulation in the Digital Economy Context

Each above-mentioned sectorial regulator is entrusted with promoting competition in their domain while achieving their specific regulatory objectives. According to Part 1 of Article 15 of the Federal law 'On Protection of Competition', federal executive bodies, regional and local state bodies are prohibited from adoption of acts and (or) performing actions that lead or may lead to prevention, restriction, elimination of competition, with exceptions set forth by federal laws. Therefore, the sector-specific regulations adopted by the federal executive bodies (e.g. the Ministry of Digital Development or the Central Bank) should be compliant with antimonopoly law. In the meantime, FAS of Russia plays a special role in this process, as it aims at promoting the competition in all fields of the digital economy and shall ensure that regulations are aligned with this aim. Pursuant to the Federal law 'On Protection of Competition', FAS of Russia supervises compliance of

3481 See, for example, Resolution of the Supreme Court of the Russian Federation dated 9 November 2015 on the case N A40-42997/2014 Teva Pharmaceutical Industries Limited v FAS Russia.

the above mentioned public bodies with the requirements of antimonopoly legislation and can issue mandatory requirements to the public bodies to repeal or amend the acts (both normative and individual) that lead to violation of antimonopoly legislation.³⁴⁸² Said that, these requirements of FAS of Russia do not render the acts of regulators void, but serve to make regulators repeal or amend the said acts on the voluntary basis. Other wise, FAS of Russia is entitled to bring an action to court which has the ultimate power to strike down anticompetitive acts of the public bodies.³⁴⁸³

Meanwhile, FAS of Russia actively interact with the regulators to ensure promotion of competition in the relevant sectors of the digital economy. For example, in 2018-2020, FAS of Russia and the Ministry of Digital Development shall provide creation of the innovation infrastructures in the field of communications based on principles of non-discriminatory requirements for all market participants.³⁴⁸⁴ By April 2019, the Ministry of Digital Development shall set requirements for communication devices (like smart-phones and computers) to provide full removability of the pre-installed programs (applications), except mandatory service apps, that will ensure the vigorous competition on the market of user applications.³⁴⁸⁵ As another example, FAS of Russia together with the Ministry of Finance and the Ministry of Digital Development shall ensure creation and functioning of fast payment platforms with the view to promote competition in payment services markets and reduce the interbank barriers during money transfers.³⁴⁸⁶

As we can see, FAS of Russia performs both *ex-ante* coordination of policies with the sector-specific regulators, as well as *ex-post* control over their compliance with antimonopoly rules.

In accordance with paragraph 1 of Article 23 of the Federal Law dated 27 July 2006 No. 152-FZ 'On Personal Data' and paragraph 1 of the Regulation on the Federal Service for Supervision of Communications and Mass Media (**'Roskomnadzor'**),³⁴⁸⁷ Roskomnadzor is the authorized body in the field of personal data protection, which is charged with control and supervision of compliance of personal data processors with requirements of the Federal Law 'On Personal Data'. Roskomnadzor has the right to conduct inquiries of data processors; require correction, blocking or elimination of the personal data which is inaccurate or obtained illegally; block access to the information violating the law on personal data and impose administrative sanctions for violation of this law.³⁴⁸⁸ In 2013 FAS of Russia and Roskomnadzor entered into an agreement on cooperation between them, including control over compliance of personal data processing with the

requirements of the legislation of the Russian Federation.³⁴⁸⁹ Despite of this, we could not find any past cases on personal data involving both public agencies.

The nature of FAS of Russia competence is focused primarily on protection of competition in markets, including preventing monopolisation and unfair competition. However, consumer protection is one of the most important derivative results of the FAS activities.³⁴⁹⁰ FAS of Russia does not function as a consumer protection authority (which is Rospotrebnadzor), but consumer welfare is implicitly embedded into its toolkit, especially when it refers to assessment of abuse of dominance and the area of tariff (price) regulations. Thus, according to paragraph 1 of Article 10 of the Federal law 'On Protection of Competition' FAS of Russia should deal with abuse of dominance affecting the whole market and general consumer welfare, but not abuse of power in the individual relationships. Since 2016 (the amendment to the Article 10 of the Federal law 'On Protection of Competition'), FAS of Russia is responsible for investigation of abuse of dominance based on violation of the rights of *indefinite number of consumers*, while Rospotrebnadzor should investigate complaints of consumers on the infringement by a dominant undertaking of their personal rights in connection with the performance of contractual or pre-contractual obligations.³⁴⁹¹ This was an important step in delineation of powers between FAS of Russia and Rospotrebnadzor, which had often overlapped in the past.³⁴⁹²

Meanwhile, FAS of Russia and Rospotrebnadzor work in close cooperation, including at the international level. In 2012 the heads of two agencies signed the Memorandum of Cooperation between the Consultative Council for the Protection of Consumer Rights of the CIS Member States and the Interstate Council on Antimonopoly Policy, where they agreed on exchange of information and joint investigation of the problems that present mutual interest.³⁴⁹³ FAS of Russia and Rospotrebnadzor have launched a number of coordinated investigations in the retail sector; however, currently most of the cases on digital consumer protection are investigated by Rospotrebnadzor.³⁴⁹⁴

Interaction between competition law and IP rights

In the Russian Federation, IP rights currently enjoy exemption from competition law. According to the Federal law 'On Protection of Competition', competition law requirements do not apply to the exercise of IP rights and agreements related to transfer of IP

rights.³⁴⁹⁵ These provisions hinder the effective application of competition law to many aspects of digital economy, which are protected by IPR. They have been severely criticised by the Russian competition authority³⁴⁹⁶ and academics, who pointed that competition law should facilitate IP dispersion and prevent the anticompetitive practices based on the monopolistic exploitation of the IP.³⁴⁹⁷

Moreover, there is a danger of excessively wide application of such provisions to transfer of goods, which have been manufactured using the IPR protected technologies. In this respect FAS of Russia stands on the position that competition law should be applied to the actions of an undertaking abusing its dominant position in the product market even if such product/technology is covered by IPR protection – the position upheld by the Supreme Court of the Russian Federation in the *Teva v FAS of Russia* case.³⁴⁹⁸

On top of this, FAS of Russia suggests using compulsory licensing as an instrument to protect competition from abuse of IPR-holders. Currently, the Civil Code contains the instrument of compulsory licensing, but only based on claims of private parties.³⁴⁹⁹ However, the case law on compulsory licensing is virtually absent.³⁵⁰⁰ The bill proposed by FAS of Russia suggests amending Article 1360 of the Civil Code that will allow the Government to permit the use of IPR without consent of the right-holders not only in the interests of state defense and security (as it is now), but also for protection of life and safety.³⁵⁰¹ This will essentially allow to extend compulsory licensing institute to the pharmaceutical industry. Moreover, FAS of Russia considers using IPR licensing as a condition of approval of an economic concentration involving IPR-protected technology, with the first cases of technology transfer requirement already in place (Bayer-Monsanto and Schlumberger-Eurasia Drilling Company).³⁵⁰²

FAS of Russia has been actively promoting amendments to the antimonopoly legislation aimed at lifting antitrust immunity for action and agreements regarding IPR (for examples, license agreements). Initially these provisions were included in the fourth and fifth “antimonopoly packages”, but FAS of Russia has removed them upon severe criticism from the business expert community.³⁵⁰³ The criticism of lifting IPR antitrust

immunity refers to potential chilling effects on innovation and decrease in investment attractiveness of Russia, rise in prices for access to the platforms and hindering effective commercialisation of technology.³⁵⁰⁴ The opponents of FAS of Russia argue that the mechanism of judicial protection contained in the Civil Code (including compulsory licensing, abuse of the right, the principle of exhaustion of the right) is effective enough to deal with abusive practices of IPR-holders.³⁵⁰⁵ However, the amendments might be included in a separate bill.³⁵⁰⁶

As of now, there are no specific, IP-related competition law guidelines in Russia.

Sectors Exempted from Competition Law Enforcement

Competition Law Labour Exemption

Many jurisdictions (such as the US and EU) provide for competition law labour exemption, whereas collective agreements between employers and workers aimed at setting the better employment terms are exempted from competition law scrutiny.³⁵⁰⁷ This labour exemption does not cover independent contractors, as they enjoy much higher level of autonomy than traditional employees.

In the age of gig economy, the new class of workers has emerged who provide services in a triangular relationship where an online platform serves as an intermediary linking the workers to potential customers. Though retaining significant degree of autonomy regarding their working schedule, in many other aspects they form dependant relationships with the platform/intermediary. Being considered independent contractors, they formally fall within the scope of competition law, which has been criticised by many scholars proposing to extend the labour exemption to gig economy workers who are not genuinely self-employed.³⁵⁰⁸

Russian competition law does not set forth formal labour exemption for collective agreements between employers and workers. However, it defines specific subjects falling within its scope. According to Part 1 of Article 3 of the Federal law 'On Protection of Competition', competition law applies to relationships related to competition and involving, *inter alia*, individual entrepreneurs and other natural persons. According to Part 5 of Article 4 of the said law, the definition of 'economic undertaking' covers also 'other

natural persons, not registered as an individual entrepreneur, but carrying out professional activities that generate income... on the basis of state registration and (or) license, as well as by virtue of membership in a self-regulating organization'. The latter provision appeared in the federal law in 2011 and was intended to extend competition laws to advocates, notaries, appraisers and other self-employed individuals.³⁵⁰⁹ It potentially covers gig economy workers (e.g. drivers working for car sharing platform Yandex.taxi who should obtain taxi license to join the platform).³⁵¹⁰ However, at the moment there are no antitrust cases focusing on agreements between individual service providers for online platforms/intermediaries (presumably, because collective bargaining in this field does not exist in Russia yet).

Defence and Other Public Sectors

Russian economy is characterised by the presence of natural and state monopolies, with the latter created in those areas in which competitive markets could still provide efficiency, but the public interests (such as economic and state security, defense, etc.) require the economic activity to be performed by a single enterprise established by the state and under the state control and supervision.³⁵¹¹ State monopolies are introduced by federal laws for each specific sector. State monopolies cover such activities as issue of the fiat money,³⁵¹² military-technical cooperation,³⁵¹³ circulation of precious metals,³⁵¹⁴ addictive and psychotropic substances.³⁵¹⁵

Russian defense industry is assumed to be less competitive and requiring the higher level of the state control. Thus, in the National Plan for the Development of Competition in the Russian Federation for 2018–2020, defense sector is explicitly exempted from some proposed initiatives aimed at increasing competition, such as presence of at least three undertakings in the market, at least one of which is privately owned; or prohibition of direct or indirect acquisition by the state of shares and equity stakes in companies operating in competitive markets.³⁵¹⁶ In addition, in contrast to competitive sectors, FAS of Russia is not authorised to oversee the procurement of goods, works, and services for the state defense purposes, which is within the competence of the special agency – Federal Service on the Defense Order (“Rosoboronzakaz”) – and subject to specific procedures set forth by law.³⁵¹⁷ Therefore, we would expect that digital and technological initiatives in this areas will fall outside the competition scrutiny.

3515 Federal Law dated 8 January 1998 N 3-FZ ‘On Narcotic Drugs and Psychotropic Substances’.

3516 The Decree of the President of the Russian Federation ‘On the Main Directions of the State Policy for the Development of Competition’ (n 205).

3517 Federal Law dated 27 December 1995 N 213-FZ ‘On the State Defense Order’.

Agriculture

Russian competition law currently does not set forth any specific antitrust exemptions for agricultural sector. However, the agricultural sector has always been in focus of national competition policies. In fact, FAS of Russia takes active part in the programme of digitalization of the agriculture with the view to promoting competition in the Russian agricultural sector and reducing its dependence on foreign breeding and genetic materials and related agrotechnological solutions.³⁵¹⁸ Thus, FAS of Russia promotes the infrastructural projects aimed at increasing competitiveness of Russian agriproducts and seed materials, such as creation of the national genetic collections for accelerated breeding and the national precision agriculture platform.³⁵¹⁹

It should be noted that the general exemptions contained in Article 13 of the Federal law 'On Protection of Competition' and the Decree of the Government of the Russian Federation dated 16 July 2009 N 583 'On the Cases of Permissibility of Agreements between Economic Entities' apply to agricultural sector with regard to conditions of exemption of vertical agreements, R&D agreements and agreements on collaborative use of the R&D results, which could cover the use of innovative technologies in agriculture.

13.2.5. Describe the competition law activity of your jurisdiction related to the digital economy since 2001

Author: Anna Pozdnyakova

Recently the topic of protection of competition in the new digital economy has been high on the agenda of the Russian competition authority. In 2017 FAS of Russia dedicated the entire 'Report on the State of Competition in the Russian Federation' (the annual document that FAS of Russia prepares for review of the Russian Government) to the challenges that digital economy poses to competition in Russia.³⁵²⁰ These challenges include, *inter alia*, the widespread use of multilateral platforms, price-setting algorithms, machine learning, big data, increasing importance of intellectual property rights, etc. These conclusions have been based on the current enforcement practice of FAS of Russia which has investigated several landmark cases in relation to violations of competition law in the digital markets, as outlined below.

Abuse of a dominant position

During last few years FAS of Russia has conducted several investigations of abuse of dominant position by the key players in digital markets. One of the most important

3518 See Point 3 of the Annex to the National Plan for the Development of Competition in the Russian Federation for 2018–2020; Press release 'Creating a System of High-tech Accelerated Selection Services Will Allow to Strengthen the Positions of Russia in the Market of Agricultural Technologies' (18 October 2018) <<https://fas.gov.ru/news/26152>> accessed 03 February 2019.

3519 *ibid.*

3520 'Report on the State of Competition in the Russian Federation in 2017' <<https://fas.gov.ru/documents/658027>> (available only in Russian) accessed 25 February 2019.

cases is the investigation in relation to Google Inc., Google Ireland Limited, Google LLC (hereinafter – ‘**Google**’).³⁵²¹ In 2015 FAS of Russia brought a case against Google following the complaint of Yandex, the leading Russian web browser, and found that Google violated Article 10 (1) of the Federal Law No. 135-FZ ‘On Protection of Competition’ (abuse of dominance). Google breached the competition law in the market for pre-installed app stores for Android OS localized for distribution in the territory of Russia.

FAS of Russia concluded that smartphones operating on Android OS should include Google Play to be commercially successful. Google used its dominant position in the market for pre-installed app stores for Android OS as a leverage in its relations with manufacturers to restrict competition in other markets. Google imposed on manufacturers the following conditions for pre-installation of Google Play on their smartphones: (i) bundling of Google Play and GMS package at the pre-installation stage, (ii) making Google a default search engine, (iii) priority placement for Google applications on the screen of mobile devices, and (iv) prohibiting the pre-installation of the competitors’ applications.

As the result of the investigation, Google Inc. and Google Ireland Limited were prescribed to stop their practices of restriction of competition and to notify users of opportunity to deactivate pre-installed apps, change search engine and location of apps on smartphone screen. In a separate decision, FAS of Russia charged Google Inc. with a fine amounting to 438,067,400.39 roubles (6,686,530 EUR).³⁵²² The companies challenged both the decision and the fine but the court ruled in favour of the Russian competition authority. On 17 April 2017, Google and FAS of Russia entered into the settlement agreement, according to which Google agreed to comply with FAS of Russia requirements to stop restrictive practices, notify users of opportunity to deactivate pre-installed apps, change search engine and location of apps on smartphone screen as well as to pay additional fines 500,000 roubles each (7,632 EUR).

In 2017 FAS of Russia investigated another important case on abuse of dominance by Microsoft Corporation (**‘Microsoft’**) on the basis of a complaint of Kaspersky Laboratory (‘applicant’), the Russian company producing antimalware solutions compatible with, *inter alia*, operational systems (OS) produced by Microsoft. According to the complaint, Microsoft employed a policy of discrimination of antimalware software and engaged in unfair competition practices. FAS of Russia defined the market as the market of RTM (release to manufacturing) versions of operational systems for stationary devices which is of global nature. According to the decision, Microsoft has the dominant position in this market (95,6%).³⁵²³ FAS of Russia found that a certain time prior to the release of a new OS, Microsoft provides external software developers with the RTM versions of the OS that they ensure the compatibility of their software with the new OS. However, when

3521 Decision of FAS of Russia on the case No. 1-14-21/00-11-15 dated 18 September 2015 <<http://solutions.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/ad-54066-15>> accessed 25 February 2019.

3522 Resolution on the Imposition of a Fine for the Case of Administrative Violation No. 4-14.31-6/00-11-16), FAS Russia <<https://solutions.fas.gov.ru/ca/pravovoe-upravlenie/ad-55539-16>> accessed 25 February 2019.

3523 Decision on the case No. 1-00-168/00-11-16 dated 15 August 2017 <<https://br.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/ag-56549-17/>> accessed 25 February 2019.

in 2015 Microsoft released the Windows 10 OS, it significantly (to six days) reduced the time for adopting external software to the new OS. FAS of Russia found the designated period to be too short to ensure the compatibility of the applicant's antimalware software with Windows 10 OS. Importantly, the new OS had the Windows Defender, Microsoft antimalware solution, already preinstalled. According to the applicant, this led to its failure to adapt Kaspersky software to the new version of OS and resulted in 42% computers left without Kaspersky Laboratory antimalware software upon upgrade to Windows 10.

These and similar restrictions lead FAS of Russia to conclusion that, taken as a whole, the requirements of Microsoft to the external software developers created discriminatory conditions for the functioning of the applicant's software with the Windows 10 OS. Thus, Microsoft actions were qualified as a breach of Article 10 (1) (8) of the Federal Law No. 135-FZ 'On Protection of Competition' (abuse of dominance through creating discriminatory conditions). FAS of Russia issued a warning obliging Microsoft to change the technological requirements to external software.

As for the unfair practices of Microsoft, FAS of Russia found that Microsoft designed the pop-ups, which warned users about the status of Microsoft Defender on their devices. These pop-ups used 'alarming' colors that could have created the feeling that a computer was threatened and, thus, could have compelled users to rely more on Microsoft own antimalware program. FAS of Russia qualified this practice as unfair competition (Article 14.2 (1) of the Federal Law No. 135-FZ 'On Protection of Competition') and issued a warning for Microsoft to change its approach to targeting users.

Since Microsoft complied with both warnings issued by FAS of Russia during the proceedings, the case against it was closed. Compliance with FAS of Russia requirements created equal conditions for antimalware developers not only in the Russian Federation, but also in other territories where Microsoft is active, thereby ensuring effective competition in the global antimalware market.³⁵²⁴

Digital Cartels

In recent years, FAS of Russia has been actively investigating cases on coordination of economic activity and bid rigging via price-setting algorithms.

One example of such investigations is **LG Electronics RUS** case. In 2017 LG Electronics RUS, the exclusive importer of LG products (including smartphones) to Russia, was found to be in breach of Article 11 (5) of the Federal Law No. 135-FZ 'On Protection of Competition' (unlawful coordination of economic activity) in the retail market of the specific models of LG smartphones sold without the use of brick-and-mortar facilities. The company was involved in illegal coordination of economic activity of LG smartphones resellers, which led to setting and maintaining prices of smartphones. LG Electronics RUS set recommended retail prices on LG smartphones and monitored resellers both

3524 Press release 'FAS Presidium: the Case against Microsoft is one of the best' <<http://en.fas.gov.ru/press-center/news/detail.html?id=53194>> accessed 25 February 2019.

manually and using a special pricing algorithm. Resellers also used pricing algorithms for monitoring their competitors' non-compliance with recommended prices set by LG Electronics RUS. LG Electronics RUS forced resellers to adhere to the recommended prices by the threat of sanctions (up to suspension of the product delivery). Such practices of LG Electronics RUS suppressed the differentiation of prices for LG smartphones. FAS of Russia concluded that the use of pricing algorithms, which was not *per se* illegal, in this particular case served as a circumstance facilitating the violation of competition law. As a result of the investigation, FAS of Russia imposed on LG Electronics RUS a fine amounting to 2,500,000 roubles (38,159 EUR) and prescribed it to stop anticompetitive practices.³⁵²⁵

In 2018 FAS of Russia investigated a case of bid rigging involving the use of price-setting algorithms. VALIRIA LLC (hereinafter – '**VALIRIA**') and Egamed LLC (hereinafter – '**Egamed**') entered into collusion during 14 auctions for the supply of surgery expendables for public healthcare organizations in 2016. In 12 out of 14 auctions VALIRIA and Egamed automated their collusion via the software built into the e-procurement platform Sberbank-AST.³⁵²⁶ The companies set-up auction robots in a way that in some auctions VALIRIA won the auction whilst in other auctions Egamed was the winner. FAS of Russia also proved that auction robots of VALIRIA and Egamed submitted bids from the same IP address and used the same IP address to sign awarded contracts. Based on these evidences, FAS of Russia concluded that VALIRIA and Egamed entered into collusion aimed at fixing the contract price during 14 auctions for supply for the public needs. FAS of Russia charged Egamed with a fine amounting to 1,040,068 roubles (15,875 EUR).³⁵²⁷ Recently FAS of Russia has investigated similar case in relation to companies' use of price-setting algorithms.³⁵²⁸

In 2016 FAS of Russia investigated another important case on coordination of economic activity in the e-commerce area. The case was related to **Apple Rus**, Apple Holding B.V., Apple Sales Ireland, Apple Operations International, Apple Inc. The market affected was defined as the federal retail market of the certain models of Apple smartphones. FAS of Russia suspected that Apple Rus had been coordinating economic activity of its resellers and distributors since 2013 by controlling the prices set by the latter. Apple Rus

3525 Decision of FAS of Russia on the case No. 1-11-18/00-22-17 dated 3 February 2018, <<https://solutions.fas.gov.ru/ca/upravlenie-po-borbe-s-kartelyami/ats-14552-18>> accessed 25 February 2019.

3526 Sberbank-AST is an electronic procurement platform used for organising auctions on goods, works and services for public and municipal needs.

3527 Decision of FAS of Russia on the case No.4-14.32-1205/00-22-18 dated 19 November 2018, <<https://br.fas.gov.ru/ca/pravovoe-upravlenie/ats-93891-18/?query=%D0%B2%D0%B0%D0%BB%D0%B8%D1%80%D0%B8%D1%8F>> accessed 25 February 2019.

3528 For example, Murmansk Antimonopoly Service of Russia decided similar case in 2016. In this case colluders ("ORKO-Invest" LLC and "TSOO" LLC) used auction robots in 22 of 25 e-procurement auctions on solid domestic and medical waste removal for state needs. Murmansk Antimonopoly Service of Russia proved collusive intent of the companies based on the patterns of their behavior when using auction robots, as well as other evidence (for example, the same IP address for the bid submission). See Murmansk Antimonopoly Service of Russia decision No. 05-03-16/6 dated 06 November 2016 <<https://br.fas.gov.ru/to/murmanskoe-ufas-rossii/05-03-16-6-ebc701b6-df71-4ef4-bb18-4bb972d58ae9/>> accessed 25 February 2019.

monitored the price compliance through e-mail communications with resellers and distributors as well as through restrictive contractual provisions, with the view to stabilizing prices of Apple smartphones in the federal market. Therefore, FAS of Russia charged Apple Rus with a breach of Article 11(5) of the Federal law № 135-FZ 'On Protection on Competition' (coordination of economic activity that affects competition) and imposed an administrative fine of 1,750,000 RUB (26,711 EUR) taking into account mitigating circumstances (voluntary termination of unlawful activity and cooperation with the anti-monopoly authority).³⁵²⁹

It is worth mentioning that FAS of Russia had investigated antitrust violations in the digital markets before it became competition enforcement mainstream. In 2009 on the basis of the complaint of NGO 'The Center of the Free Technologies', FAS of Russia launched the investigation of coordinated actions of **laptops producers** (Acer Inc., ASUSTeK Computer Inc., Dell Inc., Hewlett-Packard Company, Samsung Co. Ltd, Toshiba Corporation) that pre-installed Microsoft Windows OS on their devices. FAS of Russia found that the above mentioned producers sold more than 90% of their laptops with Microsoft Windows OS already preinstalled. The producers did not set a refunding procedure for returning non-activated Microsoft Windows OS, although license agreements between producers and final users mentioned the return opportunity. Moreover, a similar procedure was set in sub-license agreements between the producers and Microsoft Corporation. FAS of Russia made a preliminary conclusion that the producers acted in coordination when they sold preinstalled OS and offered no return procedure to customers. Despite this, FAS of Russia found no breach of competition law because (i) the producers' actions were based on the evident consumer demand; (ii) the market for laptops offered options with other preinstalled OS, as well as with no OS preinstalled; (iii) every producer created an independent return procedure for a preinstalled OS (though less than 0,1% of consumers had ever used the procedure).³⁵³⁰

Data mergers

Since 2017 FAS of Russia has resolved several significant merger cases related to digital economy. One of the landmark cases is the merger between '**Bayer AG**' (Germany) and '**Monsanto Company**' (USA). FAS of Russia investigated this merger in 2017-2018 and found that it affected the markets for the products used by agricultural producers, including agricultural crops (seeds), certain crop protection products, in particular non-selective herbicides, as well as digital solutions for agriculture. Having realized that the merger would have a significant impact on industry innovation and technological development dynamics in the agricultural sector, FAS of Russia applied a new methodology to identify potential anticompetitive effects of the merger both in the Russian and global markets. FAS of Russia took a dynamic approach by defining a market as the

3529 Decision of FAS of Russia on the case No.1-11-59/00-22-16 dated 27 March 2017 <<https://solutions.fas.gov.ru/ca/upravlenie-po-borbe-s-kartelyami/ats-20961-17>> accessed 25 February 2019.

3530 Decision of FAS of Russia on the case No.1-11/100-09 dated 16 November 2009 <<https://br.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/1-11-100-09/>> accessed 25 February 2019.

integrated agro-technological market. Thus, in this case FAS of Russia switched its focus from isolated product markets to global value chains and from price-related effects to innovations.

According to FAS of Russia preliminary decision,³⁵³¹ the merger might restrict competition in agriculture markets. In particular, following the merger, the new barriers to market entry would emerge and the existing ones would strengthen. As the result of the merger in the already oligopolistic agro-technological market, the incentives for anticompetitive collision would be increased. Moreover, FAS of Russia concluded that combining the unique innovative capabilities of Bayer and Monsanto would sharply increase their market power via exercise of intellectual property rights by the merged undertaking.

To prevent restriction of competition, FAS of Russia approved the acquisition of Monsanto by Bayer with conditions.³⁵³² Thus, Bayer is obliged not to reduce the annual volume of seeds supply to the Russian Federation and to prevent economically or technologically unjustified tying of seeds and plant protection products. Bayer is also prescribed to transfer its technologies of molecular breeding and/or germplasm for the several crops as well as historical agricultural data to Russian researchers and companies. Besides, Bayer is obliged to provide non-discriminatory access to its Digital Farming Database and Digital Farming Platforms for Russian developers of agricultural software. In opinion of FAS of Russia, access to such data plays a key role in enabling Russian companies to develop and introduce IT-products in the field of precise farming.³⁵³³ Moreover, for the first time in its enforcement practice FAS of Russia appointed an independent private trustee (Higher School of Economics Center for Transfer of Technologies) to monitor Bayer's compliance with the above requirements and to ensure implementation of the technological transfer.

In 2017 the FAS of Russia reviewed the joint venture agreement between Yandex NV LLC (hereinafter – '**Yandex**'), Uber International C.V. (hereinafter – '**Uber**') and MLU B.V. LLC (hereinafter – '**MLU**') in the market of information intermediation services for taxi drivers and passengers in the Russian Federation. According to this agreement, Yandex and Uber transferred their Russian taxi aggregator business (including trademarks) to the new company MLU, which would deliver the taxi aggregator services on the Yandex IT-platform.³⁵³⁴

FAS of Russia defined the market as the taxi aggregator market, meaning a market of taxi services delivered via multi-sided digital platform integrating passengers and driv-

3531 Decision of FAS of Russia dated 08 November 2017 <<https://solutions.fas.gov.ru/ca/upravlenie-kontrolya-agropromyshlennogo-kompleksa/-c084b115-a929-42e7-a5a9-a8362a96e6c4>> accessed 25 February 2019.

3532 Decision of FAS of Russia dated 20 April 2018 <<https://solutions.fas.gov.ru/ca/upravlenie-kontrolya-agropromyshlennogo-kompleksa/ia-28180-18>> accessed 25 February 2019.

3533 Decision of the FAS Russia on the results of consideration of the application dated April 20, 2018 <<https://solutions.fas.gov.ru/ca/upravlenie-kontrolya-agropromyshlennogo-kompleksa/ia-28180-18>> accessed 25 February 2019.

3534 Forbes, 'The merger of Yandex.Taxi and Uber – the deal of the year according to Forbes' (22 December 2017) <<https://www.forbes.ru/biznes/354799-sliyanie-yandekstaksi-i-uber-sdelka-goda-po-versii-forbes>> accessed 24 February 2019.

ers.³⁵³⁵ Despite finding the market of taxi aggregators to be highly competitive, FAS of Russia was concerned about the ability of Yandex and Uber to dump prices at the taxi aggregator market, as pointed out by survey participants.³⁵³⁶ Moreover, the taxi aggregator market tends to be concentrated.³⁵³⁷

In order to resolve the mentioned concerns, FAS of Russia approved the joint venture agreement with conditions. The conditions aimed at providing customers with the full information allowing them to choose and assess the services delivered. Moreover, MLU should not prohibit drivers and passengers from using mobile applications of other taxi aggregators.³⁵³⁸

In 2017 FAS of Russia considered the merger of the technological company **Mail.Ru** which owns a popular mail service, large advertisement platform MyTarget and social networks Vkontakte and Odnoklassniki, and telecom operator **Megafon** which develops its own over-the-top (OTT) services. FAS of Russia analyzed the market of OTT-services and the telecom market. FAS of Russia expressed two major concerns related to the merger: (i) creation of advantages by Megafon for its own OTT-services via their prioritization for users; (ii) ability to gain advantages from combining users data obtained by the merging parties. The parties resolved the first concern by claiming that provision of OTT services was carried out according to the principle of 'net neutrality'. The breach of this principle could trigger an antitrust investigation. As for the second concern, FAS of Russia found that the data sets of the merging parties were significantly overlapping and many Russian technological companies had access to the same or similar users data. FAS of Russia concluded that the merger would not harm competition on the related markets and cleared it without remedies.³⁵³⁹

Sector enquiries

FAS of Russia conducts sector enquiries in accordance with the Plan for such enquiries set for two-years period.³⁵⁴⁰ Up to the present, FAS of Russia has not conducted the specific sector enquiries for the digital markets. At the same time, in the course of investigation of digital-related cases or consideration of mergers with significant digital dimension, FAS of Russia performed the overall analysis of markets affected. In such analysis FAS of Russia successfully applied new methodological approaches which it had never used before in relation to more traditional markets. For example, in the course of Bayer/

3535 FAS of Russia, 'Analytical Report on Competition in the Taxi Aggregator Market' (2017) <<https://fas.gov.ru/documents/678673>> accessed 25 February 2019. The aim of this FAS of Russia report was to conduct market analysis and understand whether Yandex, Uber and MLU joint venture agreement raised competition concerns.

3539 Decision of FAS of Russia dated 31 March 2017, <<https://br.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/ag-6623-17/>> accessed 25 February 2019.

3540 Order of FAS of Russia dated 5 December 2016 No. 1718/16 'On Plan of Activities of FAS of Russia on Conducting Analysis of the State of Competition in the Product Markets' <http://rulaws.ru/acts/Prikaz-FAS-Rossii-ot-05.12.2016-N-1718_16/> accessed 25 February 2019.

Monsanto merger review, FAS of Russia assessed the relevant market in the context of the growing globalization and integration of agricultural production into global value chains. FAS of Russia considered not only the current position of the merging companies in the relevant markets, but also the likely changes in the structure of these markets and, accordingly, the state of competition in the short and mid-term perspective. Analysis of the markets in Google and Microsoft cases took into account the attitude of end users to the product, as in the digital markets the business strategies of both sellers and buyers are largely determined by the preferences and behavioural patterns of end users.

Since FAS of Russia takes an active stance in facing the challenges of digital economy, after gaining some experience in competition enforcement in the digital markets, the Russian competition authority raised the relevant discussion in the supranational format. Heads of CIS competition authorities discussed competition law issues in digital economy at the meeting of the Interstate Council on Antimonopoly Policy (ICAP) of CIS countries in September 2018.³⁵⁴¹ In the course of this meeting FAS of Russia presented the 'Report on Development of Competition Policy in the Digital Economy in CIS Countries' (hereinafter – the '**Report**').³⁵⁴² The Report describes the main threats to competition, and the ways for developing essential tools for effective protection of competition in the CIS markets. The Report mentions that only Russia has made an attempt to adjust competition legislation to face the challenges of digital economy. Among the CIS countries, only Belarus, Kazakhstan and Russia have some experience in investigation of cases and mergers in digital markets.³⁵⁴³ The Report raises the questions of adjusting competition law and policy to the new realities by the CIS competition authorities and suggests some solutions in order to facilitate this process. For example, the Report states that the CIS member states should take urgent measures to improve the antimonopoly legislation, including introduction of additional tools for market analysis and, in particular, updating the definition of a dominant position in order to take into account the features of digital economy.

Regulation of rates by FAS of Russia regarding digital markets

Since 2010 FAS of Russia investigated several important cases related to providing roaming services in telecommunication markets.

In 2018 FAS of Russia investigated a case in relation to the Russian largest telecom companies **MTS, Vimpelcom, Megafon and Tele 2** (hereinafter – the '**big four telecom operators**') on maintaining monopolistically high prices for telecommunication services of national roaming in the territory of the Russian Federation. From the technical point of view, roaming refers to a situation when a telecom operator (home operator) provides

3541 Press-release of FAS of Russia 'Igor Artemiev: if We Unite Our Efforts and Interests, Global Giants Shall Listen', <<http://en.fas.gov.ru/press-center/news/detail.html?id=53401>> accessed 25 February 2019.

3542 'Report on Development of Competition Policy on the Digital Economy' <e-cis.info/foto/pages/26602.docx> accessed 25 February 2019.

3543 The Report includes data on Armenia, Belarus, Kazakhstan, Kyrgyz Republic, Russia and Tajikistan.

a subscriber with opportunity to receive telecom services from another operator (partnering operator) which a subscriber does not have a contract with. Roaming services are provided when a subscriber is located in the territory where the home operator does not have infrastructure, but the partnering operator does. Home and partnering operators provide roaming services based on an inter-operator roaming agreement which sets an inter-operator roaming rate. The final price of roaming service consists of an inter-operator roaming rate (direct costs) and operational costs of implementation of the inter-operator roaming agreement (indirect costs).

The companies under investigation do not have telecom infrastructure in the territory of Sevastopol and Crimea but have inter-operator roaming agreements with several local telecom operators. FAS of Russia found that the roaming tariffs of the big four telecom operators were unreasonably higher than the inter-operator roaming rates and all the indirect costs borne by the operators with relation to roaming services provision. In the course of the investigation three of the companies (MTS, Vimpelcom and Megafon) made changes in tariffs for roaming services. FAS of Russia found new roaming tariffs economically and technologically reasonable and closed the cases against them.³⁵⁴⁴ Tele2 refused to decrease the roaming tariffs voluntarily. FAS of Russia prescribed the company to lower the roaming tariffs.³⁵⁴⁵

In 2010 FAS of Russia jointly investigated a case in relation to Russian (**MTS, Vimpelcom, Megafon**) and Kazakh (**GSM Kazakhstan, Mobile Telecom-Service, Car-Tel**) telecom companies for setting and maintaining monopolistically high prices of roaming services in the territory of the Russian Federation and international roaming services in the territory of the CIS countries (the Article 10 (1) (1) of the Federal Law dated 26 July 2006 No. 135-FZ 'On Protection of Competition') and imposing unfair terms of contracts on subscribers (Article 10 (3) (1)).

In parallel, the competition authority of Kazakhstan investigated the same case. The competition authorities of Russia and Kazakhstan initiated the case on the basis of the inquiry into the telecommunication market in the CIS countries conducted by the Headquarters for Joint Investigations of the Violations of Antimonopoly Legislation in the CIS Countries.³⁵⁴⁶ The results of the inquiry showed that roaming tariffs in CIS countries were 4.5 times higher than the prices for similar services in the European Union. FAS of Russia concluded that the Russian telecom operators set and maintained economically and technically unreasonable roaming tariffs. The companies also made changes to the terms of payment for roaming services without clear pre-notification of subscribers. FAS of Russia prescribed to decrease the roaming tariffs until the economically reasonable

3544 Decision of FAS of Russia on the case No. 1-10-101/00-11-17 dated 23 March 2018 <<https://br.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/1-10-101-00-11-17/?query=>> accessed 25 February 2019.

3545 Decision of FAS of Russia on the case No. 1-10-104/00-11-17 <<https://br.fas.gov.ru/ca/upravlenie-regulirovaniya-svyazi-i-informatsionnyh-tehnologiy/ag-29155-18/>> accessed 25 February 2019.

3546 'The Report on the State of Competition on Telecommunication Market in CIS countries', <<http://old2.fas.gov.ru/international-partnership/msap/dokladyi/>> accessed 25 February 2019.

level and to introduce a notification system on changes in the payment policy for roaming services.³⁵⁴⁷

The companies fully complied with the decision of FAS of Russia. As the result of this investigation, the roaming tariffs of the Russian companies lowered significantly (for voice call – up to two times, for SMS – up to three times, for Internet – up to four times).³⁵⁴⁸

In addition to enforcement activity, in 2014 FAS of Russia prepared the Fair Roaming Principles aimed at the creation of non-discriminatory conditions in the markets of telecommunications services and at bringing tariffs for international communications and roaming services to the reasonable level.³⁵⁴⁹ The Principles include: (i) effective competition between partnering operators, including, in registration of guest subscribers in each country; (ii) reciprocity of measures undertaken to develop competition and to reach the balance of interests of a network operator and its customers; (iii) non-discriminatory pricing for subscribers of partnering operators in home country and in the territory of roaming; (iv) non-discriminating conditions for partnering operators offering call termination services from the networks of foreign operators and operators in the country of registration. The Principles were prepared in collaboration with industry regulators and market participants and led to significant improvement of competition environment in the international telecommunications markets.

13.2.6. Recent and Ongoing Reforms of the Competition Law as the Result of Digitization

Author: Ekaterina Semenova

Over the last ten years Russian competition law has been amended several times, though these amendments have had very limited digital aspects, aiming mostly to provide electronic communication between stakeholders (authorities, business and consumers).³⁵⁵⁰ Some of these amendments established, for example:

- (i) obligatory online disclosure of information on the decisions, orders adopted by the competition authority via official website, as well as electronic submission of notices and petitions by complainants;
- (ii) introduction of compulsory electronic procurement (hereinafter – **“e-procurement”**) in certain cases.³⁵⁵¹

3547 Decision of FAS of Russia on the case No. 1-10/21-10 dated 22 October 2010.

3548 Press-release ‘Big three’ Decreased Roaming Tariffs in the RF and CIS’, <<https://www.rbc.ru/economics/01/12/2010/5703e0ea9a79473c0df17927>> accessed 25 February 2019.

3549 Press Release of FAS of Russia ‘Fair Roaming Getting Closer’ <<http://en.fas.gov.ru/press-center/news/detail.html?id=44057>> accessed 25 February 2019.

3550 To the date, the Federal Law ‘On Protection of Competition’ has been revised 43 times (with the last revision on the 27th of December 2018).

3551 E-procurement is compulsory for the following cases: bankruptcy, state and municipal procurement, procurement by state-owned companies.

Russian competition law is currently undergoing significant changes associated primarily with digitization and datafication. This is reflected in the legislative proposals aimed at adjusting traditional competition law toolkit to the digital economy, as well as to increasing efficiency of competition law enforcement in the fast changing digital markets. Finally, some reforms aim at improving competition in specific markets that are undergoing digital transformation (for example, the telecom markets).

The Presidential Decree ‘On the State Policy for the Development of Competition’ sets forth ‘effective prevention of cross-border antitrust violations as well as strengthening the competitiveness of Russian companies in global markets’ as the key goals of competition law reforms in the digital age.³⁵⁵² This imperative permeates each and every reform proposal outlined below.

Reforms of General Competition Law Principles Regarding Digital Platforms

FAS of Russia Annual Report on the State of Competition in the Russian Federation in 2017,³⁵⁵³ as well as FAS of Russia recent case studies,³⁵⁵⁴ show that digital technologies have significantly changed competition landscape, with the emergence of new product markets (for example, markets for internet search, operating systems, online advertisement), novel business models (‘one-stop shop’ ecosystem business model),³⁵⁵⁵ as well as further sophistication of anticompetitive practices powered by technology (e.g., pricing algorithms to monitor resale prices, auction robots to automate collusion in e-procurement).

The main normative act setting the digital strategy agenda for Russia, the State Programme,³⁵⁵⁶ prescribed FAS of Russia and the Ministry of Economic Development in collaboration with Russian business and expert communities³⁵⁵⁷ to develop the ‘Fifth antimonopoly package’ of amendments to the laws (hereinafter – the **‘Fifth antimonopoly package’**).³⁵⁵⁸ According to the State Programme, ‘the adjustment of competition law to digital economy’ is declared as the principal aim of the Fifth antimonopoly

3552 The Decree of the President of the Russian Federation ‘On the Main Directions of the State Policy for the Development of Competition’ (n 205).

3557 Including HSE—Skolkovo Institute for Law and Development, Yandex LLC, Internet Initiatives Development Fund, and Expert Council under the Government of the Russian Federation.

3558 Major revisions of Russian Law on the Protection of Competition are called an ‘antimonopoly package’, as these revisions amend not only the Law on Protection of Competition, but also provisions of the whole bunch of related laws. Up to date, there were three major revisions of competition law (in 2009, 2012 and 2015), together with the enactment of the Law on Protection of Competition itself (‘First Antimonopoly Package’). Official text of Fifth antimonopoly package is available at <<https://regulation.gov.ru/projects#npa=79428>> accessed 06 March 2019.

package.³⁵⁵⁹ The Fifth antimonopoly package is based on the above studies of FAS of Russia demonstrating that the market power of new digital players stems from the use of big data and network effects. Therefore, the Fifth antimonopoly package proposes novel glossary introducing legal definitions of a digital platform,³⁵⁶⁰ network effects,³⁵⁶¹ and pricing algorithms.³⁵⁶² In addition, it sets the novel criteria for market dominance of digital platforms and for merger assessment, as explained below.

Defining the market dominance. In digital economy, market shares might not indicate the market power. The more users and data the platform has amassed, the more powerful it becomes. Thus, network effects and big data might be indicative of the presence of market power.³⁵⁶³ According to the Fifth antimonopoly package, the competition authority should take into account network effects while assessing market dominance of a platform. In particular, the competition authority should assess whether network effects enable the platform to have decisive influence on the general conditions of circulation of the product in the market and/or restrict entry of potential competitors to the market. In addition, the Fifth antimonopoly package lowers criteria of dominance for a digital platform. In order to be considered dominant, the platform should have an annual worldwide turnover over 400,000,000 roubles (5,381,407.24 EUR) and the market share in the relevant market in excess of 35%.

Mergers and acquisitions notification. Competition authorities have been traditionally using the tests such as worldwide group turnover and value of assets of merging entities to detect mergers with the high anticompetitive potential. However, emerging innovative tech firms might have little turnover or assets at the time of a merger, but exercise significant competitive pressure on incumbents due to their disruptive potential. To this end, the Fifth antimonopoly package introduces the new threshold test based on the transaction price (value), along with the classic aggregate worldwide turnover and the aggregate worldwide asset value tests. The aim of the transaction price test is to trigger merger control of transactions with significant anticompetitive potential (as reflected in the transaction value), which do not pass the turnover test at the time of the transaction.³⁵⁶⁴ Under the Fifth antimonopoly package merger requires notification if the transaction price exceeds 7,000,000,000 roubles (94,174,626.66 EUR).

3559 State Programme on 'Digital Economy of the Russian Federation' (n 192).

3560 According to the Fifth antimonopoly package, digital platform is 'an infrastructure hosted on the Internet used to organize and support the interaction of sellers and buyers.'

3561 The Fifth antimonopoly package defines network effect as a 'dependence of the consumer value of the product on the number of consumers of the same group (direct network effect) or change in the value of the product for one group of consumers while reducing or increasing the number of consumers in another group (indirect network effect)'.

3562 Under the initial draft of the Fifth antimonopoly package pricing algorithm is a software to monitor, calculate or control prices.

3563 Report on the State of Competition in the Russian Federation in 2017 (n 356) 207-208.

3564 In 2017, the transaction volume threshold was incorporated into German and Austrian competition law. See 'Kartell- und Wettbewerbsrechts-Änderungsgesetz 2017' <https://www.parlament.gv.at/PAKT/VHG/XXV/II/I_01522/index.shtml> accessed 06 March 2019 and 'Neuntes Gesetz zur Änderung des Gesetzes gegen Wettbewerbsbeschränkungen' <<http://dipbt.bundestag.de/extrakt/ba/WP18/772/77250.html>> accessed 06 March 2019.

Pricing algorithms. The Fifth antimonopoly package covers the issue of pricing algorithms: according to the proposal, pricing algorithm is a software to monitor, calculate or control prices. FAS of Russia study has revealed an increased number of companies using pricing algorithms to automate anticompetitive vertical restraints, concerted actions, and cartels.³⁵⁶⁵ Therefore, the Fifth antimonopoly package sets forth that the use of pricing algorithms, though not *per se* illegal, aggravates liability when used to restrict competition.³⁵⁶⁶

Access to big data. The first draft of the Fifth antimonopoly package also covered the novel issue of digital economy, which has been widely discussed in the expert community, but never formalised in legal acts – access to big data. Big data is often called an ‘oil of the digital age’,³⁵⁶⁷ as companies, which have managed to collect massive amount of data, gain significant competitive advantage over their rivals and hold a grip over the numerous digital markets. Thus, big data might create barriers to market entry, whenever the access to data is essential to compete in the market.³⁵⁶⁸

Under the first draft of the Fifth antimonopoly package, a company might abuse its dominant position by creating discriminatory conditions of access to big data. FAS of Russia has powers to oblige the owner of big data to provide fair and non-discriminatory access to such data, including user data, to its competitors.

Provisions on access to big data faced strong criticism of business and expert communities as being vague and violating the data protection regulations.³⁵⁶⁹ Thus, FAS of Russia took out these provisions from the final draft of the Fifth antimonopoly package submitted to the Government of the Russian Federation.

Antitrust immunity for IPR. The first draft of the Fifth antimonopoly package covered another highly debated issue in Russia, namely, antitrust immunity for IPR. To prevent IPR-related anticompetitive practices, the first draft proposed to lift antitrust immunity for IPR. However, business community strongly opposed to this initiative (see Section ‘Interaction between competition law and IP rights’ for a more detailed discussion). These provisions have been taken out from the final draft submitted to the Government of the Russian Federation.

3565 Report on the State of Competition in the Russian Federation in 2017 (n 356) 13-14.

3566 Final draft of the Fifth antimonopoly package submitted to the Government of Russian Federation does not contain provisions on pricing algorithms. Nevertheless, provisions on pricing algorithms as aggravating circumstances in case of competition law violations are now part of another legislative proposal currently undergoing public discussion <<https://regulation.gov.ru/projects#npa=85113>> accessed 06 March 2019.

Как защищать конкуренцию в условиях глобализации и четвертой промышленной революции) <<https://id.hse.ru/novelty/218207502.html>> accessed 06 March 2019.

3569 See, e.g., ‘Russian Corporate Lawyers Association Report on the Fifth Antimonopoly Package’ <<https://rcca.com.ru/files/docs/2018/15022018/okur1.doc>> accessed 06 March 2019.

To summarize, the draft of Fifth antimonopoly package submitted to the Government of the Russian Federation in February 2019 misses some of its highly innovative proposals, but still provides significant improvements of competition law approach to the digital challenges, most notably, those posed by abuse of dominance and assessment of merger.

Currently the Fifth antimonopoly package is undergoing further review in the Government of the Russian Federation and might be subject to subsequent amendments. FAS of Russia expects the Fifth antimonopoly package to enter into effect in January 2020.³⁵⁷⁰

Amendments to Competition Law Enforcement in the Digital Age

The challenges posed by technological advances prompted certain improvements in the enforcement practices of FAS of Russia. These improvements are aimed at finding effective tools to make companies comply with FAS prescriptions in the fast changing technological environment.

With the increasing role of data and IPR in the digital economy, an institute of 'trustee', that is a company monitoring compliance with competition authority prescriptions, is important as it helps control transfer of digital technologies.

Trustee has long been unknown in Russian competition law. FAS of Russia introduced this institute in the case on Bayer AG and Monsanto merger in 2018. In this case FAS of Russia designated a trustee – Higher School of Economics Center on Transfer of Technologies – to monitor the transfer of agriculture biotechnologies from merging undertakings to Russian companies. Currently it is the only case of recourse to a trustee in Russian competition law enforcement practice. However, the Fifth antimonopoly package formally sets forth the institute of a trustee which is required to be independent from the parties.

Website blocking is another novelty in competition law enforcement in the digital age. In Russia, website blocking injunctions constitute a popular tool of enforcement. For example, the court can issue an injunction to block access to websites of companies for non-compliance with the data protection laws.³⁵⁷¹

According to the FAS of Russia proposal to amend the administrative law, in case a company does not comply with the competition authority's decisions on abuse of market power, collusion or merger commitments, the competition authority might ask a court to issue a website blocking injunction.³⁵⁷² As the result, the internet provider should

block an access to the website of the company until the latter complies with FAS of Russia order. This legislative proposal is currently undergoing public consultation.

Competition Law Reform for the Pre-Installed Applications Market

To provide competition in the market of software applications, the Government of the Russian Federation prescribed FAS of Russia to develop a law on the pre-installation of software applications.³⁵⁷³ In January 2019 FAS of Russia presented the 'Concept of Pre-Installation of Software Applications' (hereinafter – the '**Concept**') laying the ground for further legislative proposals on the development of competition in the software application market in Russia.³⁵⁷⁴

The reasoning behind the Concept is that pre-installation of software applications on a device is the most effective way to boost their usage. This, in turn, can increase the market power of a software company via network effects. As FAS of Russia decision on abuse of a dominant position by Google has demonstrated, pre-installation of Google Play Market and other Google applications provided a competitive advantage for Google in the market of pre-installed app stores for Android OS.³⁵⁷⁵ Russian software developers lacking the opportunity to pre-install applications could not compete with transnational corporations having strong brands and global agreements on pre-installation with device manufacturers.

The aim of the Concept is two-folded: to protect Russian software application developers, on the one hand, as well as to prevent cross-border antitrust violations by transnational corporations, on the other hand. To this end, the Concept sets two requirements for device manufacturers: (i) to pre-install Russian software applications on their devices, and (ii) to provide users with opportunity to completely delete pre-installed applications except for service applications enabling normal functioning of a device.

The Concept listed four types of Russian software which device manufacturers should pre-install: (i) browser, (ii) antivirus software, (iii) geolocation software (maps, navigators); (iv) messenger. The manufacturer of devices is free to choose a Russian software developer, as well as the method of such pre-installation.

The Concept is currently under review of the Ministry of Digital Development.

Competition Law Reform for the Telecom Market

The strategic documents on transformation of competition law in the digital age require FAS of Russia to propose law amendments removing roaming charges, as well as providing non-discriminatory access to the network telecommunication facilities for telecom operators.³⁵⁷⁶

3573 'Roadmap for the Development of Competition in 2018 – 2020 years' (n 31) part VII 'Information Technologies'.

3574 FAS of Russia Press Release 'FAS Presented the Concept on the Pre-Installation of Software Applications' (25 January 2019) <<https://fas.gov.ru/news/26844>> accessed 06 March 2019.

3575 Decision of FAS of Russia on the Google case (n 366).

3576 See The Decree of the President of the Russian Federation 'On the Main Directions of the State Policy for the Develop-

The work of FAS of Russia aimed at roaming removal started in 2017 by issuing orders to four Russian mobile operators. These orders prescribed them to stop abuse of a dominant position by maintaining monopoly high prices (tariffs) for the roaming communication services.³⁵⁷⁷ In particular, FAS of Russia found that four Russian mobile operators set unreasonably high price of incoming and outgoing calls for subscribers traveling around Russia, as well as introduced an unjustified daily fee when subscribers were outside the 'home' region.³⁵⁷⁸

In December 2018 the President signed amendments to the law which removed roaming within the Russian territory.³⁵⁷⁹ The amendments require mobile operators to set the same price regardless of whether a subscriber is in the 'home' region or is traveling around Russia. The amendments will enter into force in June 2019.

Non-discriminatory access to the telecommunication network facilities is another pending reform of the competition law in the telecom market. This reform is aimed at providing available access to communication services to remote and less populated areas of the Russian Federation. As building competing networks facilities to provide services to these areas is economically unreasonable, the Government of the Russian Federation appointed a telecom company Rostelecom to be a sole provider of universal service to settlements with small population (see Section '*Is universal service for Internet access available?*').³⁵⁸⁰

To develop competition in the telecom market, it is essential that all competitors have equal access to the telecom infrastructure, such as cable ducts and poles. Notably, Rostelecom has already abused its dominant position unreasonably increasing the tariff for the access to cable ducts for other telecom companies.³⁵⁸¹

Roadmap on the Development of Competition in telecom market requires FAS of Russia to develop laws providing non-discriminatory access to the telecommunication infrastructure, as well as streamlining the procedure of obtaining sanitary and epidemiological clearances and telecom facilities construction, speeding up the procedure of obtaining permit for radio frequency channels' use. FAS of Russia's work on these legislative proposals is in progress.

ment of Competition' (n 205); 'Roadmap for the Development of Competition in 2018 – 2020 years' (n 31) part VI 'Telecommunications'.

3581 In 2018 FAS of Russia has charged Rostelecom with a fine for the abuse of dominant position in the market of network telecommunication facilities. FAS of Russia decree No 4-14.31-1251/00-11-17 dated 20 February 2018. <<https://fas.gov.ru/documents/614825>> accessed 06 March 2019.

As this Report demonstrates, digitalization of the Russian economy affects competition law and regulations in many ways. Russia has made significant steps towards adjusting its institutional infrastructure and normative basis to the new realities. First of all, this has been done through numerous state programmes, plans, and legislative proposals, which means that digital challenges are treated seriously on the highest public level. Business community is catching up, though at a slower pace, with the national tech giants (like Yandex and Mail.group) and large digital investors (like the state-backed Sberbank) having emerged during the past decade.

Many improvements are to be done yet. The main challenge still lays in the fact that the technological development is so fast that dealing with it in a reactive way often proves counter-productive. Importantly, the Russian competition authority stays on top of these new developments and successfully applies the existing tools along with devising the new approaches to complex phenomena of the digital economy, as has been demonstrated by a number of case studies and successful innovative practices.

Chapter 14: Country Report – India

Ujjwal Kumar, Swasti Gupta and Poulomi Ghosh

14.1. What is the Business/Technological Environment for the digital economy in your jurisdiction?

14.1.1. What is the Internet access penetration level in your jurisdiction as part of the total population?

As of April 2018, there were 493.6 million³⁵⁸² internet subscribers in India increasing from 251.59 million in 2014. According to a March 2019 report the number of internet users as of December 2018 is pegged at 566 million and is expected to rise to 627 million by the end of 2019.³⁵⁸³ The number of mobile phone users in India have recently reached the 904.25 million mark.³⁵⁸⁴

Up till 2018, Indian citizens have downloaded as many as 12.3 billion applications.³⁵⁸⁵ Additionally, there are 294 million Indians engaged in social media with an average Indian social media user spending as many as 17 hours a week on a social media platform, thus surpassing the number in US and China.³⁵⁸⁶ Further, since 2013 there has been a 95% decline in data costs in the country and the fixed-line download speed has quadrupled between 2014 and 2017.³⁵⁸⁷

14.1.2. Composition of Internet users (age, gender, rural v. cities)

Out of the 493.6 million internet subscribers, 348.13 million are from the urban and 145.83 million from the rural areas.³⁵⁸⁸ As per a 2017 UNICEF report, internet usage in India continues to be a 'male preserve' with less than one-third of Indian internet users

being female.³⁵⁸⁹ Over all, female netizens stand at a low of 30-35% of the population.³⁵⁹⁰ Further, only 59% females in India own a mobile phone as opposed to 80% males with only 16% females using mobile internet.³⁵⁹¹

Table 1: Internet Subscribers by Service Areas

Service Areas ¹¹	Total Internet Subscribers (in millions)		
(as on 31.12.2018)	Rural	Urban	Total
Andhra Pradesh	12.83	24.78	37.61
Assam	5.04	4.77	9.81
Bihar	13.51	14.9	28.4
Delhi	0.72	30.42	31.14
Gujarat	8.26	23.16	31.43
Haryana	3.8	5.25	9.05
Himachal Pradesh	2.04	4.9	6.94
Jammu and Kashmir	1.92	3.89	5.81
Karnataka	6.69	25.45	32.14
Kerala	7.49	12.31	19.8
Kolkata	1	12.35	13.35
Madhya Pradesh	6.94	18.94	25.88
Maharashtra	12.79	26.66	39.45
Mumbai	0.75	21.72	22.48
North East	2.38	3.56	5.94
Odisha	5.67	6.54	12.2
Punjab	4.58	14.05	18.63
Rajasthan	9.47	16.99	26.46
Tamil Nadu	9.31	30.26	39.57
Uttar Pradesh (East)	14.46	20.29	34.75
Uttar Pradesh (West)	7.03	16.75	23.79
West Bengal	9.14	10.17	19.31
Total	145.82	348.12	493.95

14.1.3. Availability of Internet networks

(a) Geographic

Internet spread in India is fast increasing, with rural areas fast catching up with their urban counterparts. As per the above table, in December 2018 rural internet penetration was around 30 percent, while that of urban India was 70 percent. However, there are data showing that of the total active internet users, around 40 percent are from rural

³⁵⁸⁹ https://www.unicef.org/publications/files/SOWC_2017_ENG_WEB.pdf

³⁵⁹⁰ <https://www.tribuneindia.com/news/spectrum/internet-the-big-indian-gender-divide/737100.html>

³⁵⁹¹ https://www.business-standard.com/article/economy-policy/gender-gap-in-mobile-and-internet-usage-in-india-as-per-gsma-report-119030900696_1.html

³⁵⁹² <http://dot.gov.in/sites/default/files/statistical%20Bulletin-2018.pdf?download=1>

areas.³⁵⁹³

(b) Consumer choice

Consumers have the option to choose from the several telecom players. The table below shows the subscriber base as on June 2018 according to the service providers. It is evident that Bharti Airtel is more favoured by consumers as compared to other telecom service providers.

Table 2: Service Provider wise Subscribers Base (in Million) (wireless+wireline)³⁵⁹⁴

Service Provider	Subscription Base
Bharti Airtel	348.52
Vodafone	222.97
Idea	211.21
Reliance Jio	186.56
BSNL	123.95
Aircel	74.15
Reliance	1.11
Tata	33.07
Telenor	37.98
MTNL	6.90
Sistema	-
Quadrant	0.24
Total	1206.22

As far as subscription base is concerned, things have rapidly changed after the introduction of 4G by Reliance Jio with a very low tariff rate. There are only three 4G internet service providers in India after the consolidation phase and as of now the user base is evenly distributed between the three – Bharti Airtel has 87 million users, Reliance Jio has 82 million users and Vodafone-Idea has 81 million users.³⁵⁹⁵ The internet services of PSUs like BSNL and MTNL is still restricted to 3G.

(c) State-owned and private ownership

As per the above table, five top players,³⁵⁹⁶ Reliance Jio Infocomm Ltd (297.23 million subscribers), Bharti Airtel (112.13 million subscribers), Vodafone Idea (110.25 million subscribers), Bharat Sanchar Nigam Limited (BSNL) (21.01 million subscribers) and Tata

3593 <https://www.livemint.com/industry/telecom/internet-users-exceed-500-million-rural-india-driving-growth-report-1552300847307.html>

3594 <https://main.trai.gov.in/sites/default/files/PIRJune03102018.pdf>

3595 CLSA data in fourth quarter of FY19; <https://prime.economictimes.indiatimes.com/news/69834556/media-and-communications/dead-end-for-mobile-internet-why-millions-of-users-may-not-go-online-soon>

3596 https://main.trai.gov.in/sites/default/files/PR_No.27of2019_0.pdf

Teleservices (2.17 million subscribers) cumulatively hold 98.65% share of the market of broadband service providers in India.

As on January 31, 2019,³⁵⁹⁷ the private sector service providers have the higher market share of wireless subscribers (89.95%) while Bharat Sanchar Nigam Limited (BSNL) and Mahanagar Telephone Nigam Limited (MTNL), the two Public Sector Unit (PSU) internet service providers gripped a market share of only 10.05%.

Do they have the status of utilities? Are they subject to regulation?

In 2017, the Supreme Court of India observed that “citizens have the right to access the Internet to gain information, wisdom and knowledge and their right cannot be curtailed unless it encroaches into the boundary of illegality”.³⁵⁹⁸ In 2018, Kerala became the first state to declare internet access as a basic right for every citizen just like food, education and water.³⁵⁹⁹

Internet does have status of utilities in India, which can be inferred from Recommendation on Net Neutrality,³⁶⁰⁰ issued in 2017 by the Telecom Regulatory Authority of India (TRAI). TRAI has treated ‘High speed internet’ as one of the components of digital infrastructure as a utility to every citizen.³⁶⁰¹ The provision of digital Infrastructure in the form of availability of high speed internet for delivery of services to citizens is one of the overarching goals of the government of India.³⁶⁰² Currently, India lags behind globally in average internet speed– internet speed in India is 2.3 times lower than global averages for fixed mobile broadband and 2.5 times lower for mobile broadbands.³⁶⁰³

Internet is subject to regulations devised by the Telecom Regulatory Authority of India Act, 1997 along with regulations, orders and directions issued by TRAI and the Department of Telecommunications (DoT). Additionally, the Indian Telegraph Act, 1885 and the Wireless Telegraphy Act 1933, along with the rules framed thereunder are also applicable to availability of internet networks.

(a) Affordability of networks (general information about affordability of Internet access and distribution across income categories – if available)

Internet access, particularly mobile data, in India is quite affordable with 1 GB of data being available for just Indian Rupees (INR) 18.50 (US\$ 0.26) as compared to global average of about Rs.600.00.³⁶⁰⁴ Further, as per the 2018 Affordability of Internet report,

India ranks 8th amongst 61 countries (moving up nine places from 2017) in terms of providing access to affordable Internet.³⁶⁰⁵ The report credits this rise in India's ranking to increased investments in public access solutions and TRAI's support for a "competitive mobile market".³⁶⁰⁶

(b) Is universal service for Internet access available? What are the forms it takes?

India is yet to achieve universal internet access, however, National Digital Communications Policy 2018 (NDC Policy) targets universal access of internet in India by the year 2022.³⁶⁰⁷

14.2. Digital Economy Growth levels in your jurisdiction the last 5 years

14.2.1. Smart cities and networks development

As of February 2019, there are 100 cities with 5,151 ongoing projects under the Smart Cities Mission in India.³⁶⁰⁸ As such the term 'Smart Cities' do not have any definite categorical definition. However, for operational purposes, the term 'Smart Cities', have been defined as per the government's definition to mean a city whose entire urban eco-system is represented by the four pillars of comprehensive development that is institutional, physical, social and economic infrastructure. This is a long-term goal and cities can work towards developing such comprehensive infrastructure. .³⁶⁰⁹ 53% projects of the ongoing Smart Cities projects are currently at the tendering stage while 39% projects are either completed or in the implementation stage.³⁶¹⁰

The Indian government has also launched BharatNet³⁶¹¹ (earlier "National Optic Fibre Network" (NOFN)) with the objective to connect all the 250,000 gram panchayats (village governance units) in the country and to bridge the connectivity gap between villages and cities. Phase I of the BharatNet initiative has already started, and Phase II is being planned for swift implementation of optical fibres across the rural areas of the Indian states.

14.2.2. Corporate finance for the digital economy

The growth of digital economy in India is being fuelled by investments from various sources, including public and private investments. Private investments include domestic, foreign and institutional investments as well as venture capitals.

14.2.3. How many consumers are actively engaging in e-commerce?

As of January 2019, there were about 176.8 million e-commerce users in India.³⁶¹² This is a steep increase from 40 million such users in 2013.³⁶¹³

14.2.4. Engagement with social networks

14.2.4.1 Most popular social networks in your jurisdiction

Facebook, WhatsApp, Twitter, Instagram, are some of the popular social networks in India. More recently, Tik Tok is also gaining popularity. Over 250 million Indian users are active on Facebook on a monthly basis, and over 200 million users are active on WhatsApp in India.³⁶¹⁴ Further, as per a recent announcement, YouTube now has over 295 million monthly active users in India.³⁶¹⁵

Table 3: Current Market Share of Social Media Networks in India³⁶¹⁶

Facebook	Pinterest	YouTube	Twitter	Instagram	LinkedIn
89.23%	4.05%	3.03%	1.96%	1.49%	0.08%

14.2.4.2. Do consumers practice single-homing or multi-homing regarding social networks?

Consumers often practice multi-homing regarding social networks.

14.2.5. Level of development of the IoT and Industry 4.0. in your jurisdiction

As per the report released by NASSCOM, the IoT market in India is poised to reach \$15 billion by 2020, accounting for 5% of the global market. The current number of IoT devices in India is around 60 million and the number is predicted to increase to 1.9 billion units by 2020.

3616 <http://gs.statcounter.com/social-media-stats/all/india>

14.2.6. Please specify the major digital platforms in your jurisdiction and their market penetration.

14.2.6.1. Concentration levels in your jurisdiction (if available) for:

- (a) *Internet access providers*: Five top players, namely, Reliance Jio Infocomm Ltd (297.23 million), Bharti Airtel (112.13 million), Vodafone Idea (110.25 million), BSNL (21.01 million) and Tata Teleservices (2.17 million) cumulatively hold 98.65% market share of total broadband subscribers in India.³⁶¹⁷ The top five Wired Broadband Service providers were BSNL (9.17 million), Bharti Airtel (2.33 million), Atria Convergence Technologies (1.41 million), Hathway Cable & Datacom (0.79 million) and MTNL (0.76 million).³⁶¹⁸ The top five Wireless Broadband Service providers were Reliance Jio Infocomm Ltd (297.23 million), Vodafone Idea (110.23 million), Bharti Airtel (109.80 million), BSNL (11.84 million) and Tata Teleservices (1.72 million).³⁶¹⁹
- (b) *Search engines (users)*: In India, Google holds 97.35% market share followed by other search engines such as Bing (1.68%), Yahoo (0.91%), DuckDuckGo (0.04%) and Baidu (0.01%).³⁶²⁰
- (c) *Social networks*: On a monthly basis, over 250 million Indian users are active on Facebook and over 200 million users are active on WhatsApp in India.³⁶²¹ Further, as per a recent announcement, YouTube now has over 295 million monthly active users in India.³⁶²²

As of third quarter of 2017, both YouTube and Facebook shared a 30% market penetration rate in India followed by WhatsApp with 28% market penetration.³⁶²³

14.2.7. Information about ownership (foreign or domestic, state-owned versus private)

The popular platforms show a combination of domestic and foreign ownership for private players and state-owned ownership for public players. Interestingly, there are no foreign ISPs.

- (a) Common ownership by major business players/conglomerates and institutional investors

Common institutional investment is visible in sectors such as ride hailing in India where the two prominent platforms, namely Ola and Uber with common ownership by SoftBank, Tiger Global Management LLC, Sequoia Capital and Didi Chuxing.³⁶²⁴

14.2.8. Please indicate any local large digital players and their market shares

Some of the local digital players enjoying high market shares in the digital sector have been listed below:

- (a) *Hotstar (Video Streaming platform)*: as of March 2018, Hotstar, owned by the Walt Disney Company India, enjoys 69.4% share in the video streaming market.³⁶²⁵
- (b) *Ola (Taxi-aggregator platform)*: Bhavish Agarwal and Ankit Bhati (founders of Ola) hold 11.95% of the company. Other individual investors for Ola are Ratan Tata, Anupam Mittal of People Group and Rehan Yar Khan of Orios Venture Partners. As of December 2017, Ola held 56.2% of market share in India's ride-hailing market.³⁶²⁶
- (c) *Oyo Rooms (Hotel Booking platform)*: Oyo Rooms, based out of Gurgaon, Haryana, gets substantial investment from SoftBank, Sequoia Capital, and Greenoaks Capital. As of December 2017, Oyo dominated 68% market share in the hospitality segment.³⁶²⁷
- (d) *Reliance Jio (Telecom service provider)*: as of September 2018, Reliance Jio, primarily owned by Reliance, enjoyed a market share of 31.6% in the telecom sector.³⁶²⁸
- (e) *Paytm (Payments wallet platform)*: Paytm owned by One97 Communications received funding last year from Alibaba Group and its affiliate Ant Financial (both China based investors). As of April 2017, Paytm held 68% market share in the payment wallets segment.³⁶²⁹
- (f) *Big Basket (Online grocery platform)*: as of 2018, Big Basket, a privately-owned company with funding from Alibaba, leads the online grocery market with 34% market share.³⁶³⁰

- (g) *Byju's (Online learning platform)*: Byju is India's leading online learning platform and now the world's most valued education technology firm. Byju's gets its majority investment from the Chan Zuckerberg Initiative (CZI), Sequoia Capital, Sofina, Verlinvest, etc.³⁶³¹
- (h) *Swiggy and Zomato (Online Food Delivery platform)*: as per a 2019 survey, Swiggy, privately owned, leads the ranking in online food delivery platforms followed by Zomato and UberEats.³⁶³²

14.2.9. What is the level of development of the blockchain economy in your jurisdiction?

India is largely into exploratory mode as far as implementation of blockchain technology is concerned. However, it is finding place in Indian policy discourses and may see blockchain use cases in near future.

In his budget speech in 2018, the Finance Minister of India announced the intention of the government to explore blockchain based solutions for strengthening the rapidly growing digital economy.³⁶³³ This announcement supplemented the Digital India campaign launched by the government in 2015 that emphasizes on building a digital infrastructure to digitally empower the country. To that end, the following cases may be highlighted:

- (a) **Bankchain**: Formed in 2017, it is an alliance of Indian and foreign banks to explore, build and implement blockchain based solutions for banking.³⁶³⁴ At present, the bankchain community comprises of 37 members with 28 Indian Banks and has 22 live projects.³⁶³⁵ State Bank of India was the first member of the Bankchain community, followed by other prominent banks such as ICICI Bank Ltd, Kotak Mahindra Bank Ltd, HDFC Bank Ltd and Yes Bank Ltd etc.
- (b) **Indiachain**: In 2018, the government launched its own blockchain initiative titled Indiachain which was developed by the country's think tank the National Institute for Transforming India (or NITI Aayog). It is intended to be used for supply chain management, land records, identity management, education certificates, benefit and power distribution, cross-border finance, and EHRs (electronic health records).³⁶³⁶ The government has also linked Indiachain with Indiastack, the country's unique

identification database for the Aadhar initiative, in order to track taxes coming from the entire country.

TRAI (the country's telecom regulator) is leveraging the use of blockchain to keep a check on Unsolicited Commercial Communication (UCC) or spam calls and safeguard the privacy of telecom users. Recently, an Indian IT firm launched a Blockchain solution, in collaboration with TRAI, to assist telecom providers in curbing spam calls.³⁶³⁷

14.3. What is the institutional framework for the digital economy in your jurisdiction?

14.3.1. An overview of regulatory and policy frameworks relevant for digital economy

The regulatory and policy framework related with digital economy is still evolving in India. While there are few existing binding laws, rules and regulations, there are many in the pipelines in draft form under consideration by the government. In addition, there are few policies, adopted as well as under consideration, which provide necessary direction and strategies vis-à-vis the emerging digital economy.

Following section provides an overview of relevant laws, rules, regulations and policies, both existing and those in draft form under consideration. The following overview captures the framework on 'as-it-is' basis and does not present any analysis.

14.3.1.1. The Information Technology Act 2000³⁶³⁸

The Information Technology Act 2000 (IT Act), which *inter alia* aims at providing "legal recognition for transactions carried out by means of electronic data interchange and other means of electronic communication, commonly referred to as —electronic commerce", is presently the most crucial binding instrument vis-à-vis the digital economy. The IT Act, which has extra territorial jurisdiction, was passed to give effect to the Model Law on Electronic Commerce,³⁶³⁹ which was adopted by the United Nations General Assembly vide resolution A/RES/51/162, dated the 30th January 1997.

According to the Act, 'data' means "a representation of information, knowledge, facts, concepts or instructions which are being prepared or have been prepared in a formalised manner, and is intended to be processed, is being processed or has been processed in a computer system or computer network, and may be in any form (including computer printouts magnetic or optical storage media, punched cards, punched tapes) or stored internally in the memory of the computer".³⁶⁴⁰ The Act also defines 'information', which

³⁶³⁷ <https://telecom.economictimes.indiatimes.com/news/tech-mahindra-launched-blockchain-solution-to-curb-spam-calls-in-india/69147376>

³⁶³⁸ <https://indiacode.nic.in/bitstream/123456789/1999/3/A2000-21.pdf>

³⁶³⁹ The Model Law was completed and adopted by United Nations Commission on International Trade Law

³⁶⁴⁰ Section 2(o) of the Information Technology Act, 2000

includes “data, message, text, images, sound, voice, codes, computer programmes, software and data bases or micro film or computer generated micro fiche”³⁶⁴¹.

The Act defines ‘intermediary,’ with respect to an electronic records, as “any person who on behalf of another person receives, stores or transmits that record or provides any service with respect to that record and includes telecom service providers, network service providers, internet service providers, web-hosting service providers, search engines, online payment sites, online-auction sites, online-market places and cyber cafes”.³⁶⁴² The intermediaries are required to preserve and retain information for prescribed duration and format.³⁶⁴³

The IT Act also provides for validity of contracts reached through electronic means. It says that “such contracts shall not be deemed to be unenforceable solely on the ground that such electronic form or means was used for that purpose”³⁶⁴⁴.

The Act further provides for compensation for failure to protect sensitive personal data due to negligence of the controller of such data. According to the Act, “where a body corporate, possessing, dealing or handling any sensitive personal data or information in a computer resource which it owns, controls or operates, is negligent in implementing and maintaining reasonable security practices and procedures and thereby causes wrongful loss or wrongful gain to any person, such body corporate shall be liable to pay damages by way of compensation to the person so affected”³⁶⁴⁵.

According to the Information Technology (Reasonable Security Practices and Procedures and Sensitive Personal Data or Information) Rules 2011,³⁶⁴⁶ (IT Security Rules 2011) sensitive personal data or information means such personal information³⁶⁴⁷ which consists of information relating to the following:³⁶⁴⁸

- Password
- financial information such as Bank account or credit card or debit card or other payment instrument details
- physical, physiological and mental health condition
- sexual orientation
- medical records and history
- biometric information

3641 Section 2(v), IT Act, 2000

3642 Section 2(w), IT Act, 2000

3643 Section 67C, IT Act, 2000

3644 Section 10A, IT Act, 2000

3645 Section 43A, IT Act, 2000

3646 Department of Information Technology published these Rules under Section 87(2), read with Section 43A, of the IT Act; <https://www.wipo.int/edocs/lexdocs/laws/en/in/in098en.pdf>

3647 “Personal information” means any information that relates to a natural person, which, either directly or indirectly, in combination with other information available or likely to be available with a body corporate, is capable of identifying such person; Section 2(i), Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011

3648 Rule 3, Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011

- any detail relating to the above as provided to body corporate for providing service
- any of the information received under above by body corporate for processing, stored or processed under lawful contract or otherwise

However, any information that is freely available or accessible in public domain or furnished under the Right to Information Act, 2005 (or any other laws) will not be regarded as sensitive personal data or information for the purposes of these Rules.

The IT Security Rules 2011 require body corporates to provide a privacy policy vis-à-vis personal information including sensitive personal data and ensure that these are available for view by such providers of information.³⁶⁴⁹ Further such policy also has to be published on website, including the following information:

- Type of personal or sensitive personal data or information collected
- Purpose of collection and usage of such information

The IT Security Rules 2011 also require body corporate to obtain consent in writing from sensitive data providers regarding purpose of usage before collection of such data. Sensitive personal data cannot be collected unless:

- the information is collected for a lawful purpose connected with a function or activity of the body corporate, and
- the collection of the sensitive personal data or information is considered necessary for that purpose³⁶⁵⁰

In addition, it needs to be ensured by the body corporates that person providing such data is having the following knowledge:

- the fact that the information is being collected
- the purpose for which the information is being collected
- the intended recipients of the information; and
- the name and address of (i) the agency that is collecting the information; and (ii) the agency that will retain the information

Further, the body corporates holding sensitive personal data or information not only are duty bound to use such data only for the purpose for which it has been collected (purpose limitation), but also to ensure that the same shall not be retained for longer than is required for such purposes. The data providers have the right to review their data upon demand.

Furthermore, prior to collection, the provider of information will have to be given the option to not provide data or information sought to be collected. The provider can also withdraw his/her consent, by intimation in writing. Any grievances of such providers with respect to processing of information will also have to be addressed by the body

³⁶⁴⁹ Rule 4, Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011

³⁶⁵⁰ Rule 5, *ibid*

corporate in a time bound manner (within one month). Name and contact details of a Grievance Officer have to be provided on the providers' website.³⁶⁵¹

Similarly, any transfer of the collected 'sensitive' personal data to any third party, whether in India or in any other country, may only take place when the third party adheres to the same level of data protection that is adhered by the transferee entity. Such transfer is allowed only if it is necessary for performance of the lawful contract between the body corporate and the provider of such information or when such person has consented to data transfer.³⁶⁵²

There is also duty upon such body corporates to keep the information secure, for which they are expected to comply with reasonable security practices and procedures, such as those provided under the International Standard IS/ISO/IEC 27001 on "Information Technology – Security Techniques – Information Security Management System – Requirements".³⁶⁵³ If any information security breach occurs, the body corporate would be required to demonstrate that it has implemented the documented information security programme and information security policies.

The IT Act also prescribes punishment, which includes imprisonment, for disclosure of information in breach of any lawful contract. Section 72A of the Act states that *"any person including an intermediary who, while providing services under the terms of lawful contract, has secured access to any material containing personal information about another person, with the intent to cause or knowing that he is likely to cause wrongful loss or wrongful gain discloses, without the consent of the person concerned, or in breach of a lawful contract, such material to any other person, shall be punished with imprisonment for a term which may extend to three years, or with fine which may extend to five lakh rupees, or with both"*.

The Act, however, exempts intermediaries from liability for any third-party information, data, or communication link made available or hosted by him in certain cases,³⁶⁵⁴ which includes:

- Where the function of the intermediary is limited to providing access to a communication system over which information made available by third parties is transmitted or temporarily stored or hosted, or
- Where the intermediary does not (i) initiate the transmission, (ii) select the receiver of the transmission, and (iii) select or modify the information contained in the transmission.

However, the intermediary is liable if: (i) it has conspired, abetted, aided or induced the commission of the unlawful act; or (ii) it fails to expeditiously remove or disable access to such information, upon receiving actual knowledge of the commission of unlawful act.

3651 Ibid

3652 Rule 7, Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011

3653 Rule 8, Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011

3654 See Section 79, IT Act, 2000

There are also the Information Technology (Intermediaries Guidelines) Rules, 2011,³⁶⁵⁵ notified under the IT Act,³⁶⁵⁶ which provide for the following due diligence to be observed by the intermediaries:

- The intermediaries are required to publish the rules and regulations, privacy policy and user agreement for access or usage of the intermediary's computer resource
- These rules etc. should inform the users of computer resource not to host, display, upload, modify, publish, transmit, update or share any information that:
 - belongs to another person and to which the user does not have any right;
 - is grossly harmful, harassing, blasphemous defamatory, obscene, pornographic, paedophilic, libellous, invasive of another's privacy, hateful, or racially, ethnically objectionable, disparaging, relating or encouraging money laundering or gambling, or otherwise unlawful;
 - harm minors in any way;
 - infringes any patent, trademark, copyright or other proprietary rights;
 - violates any law for the time being in force;
 - deceives or misleads the addressee about the origin of such messages or communicates any information which is grossly offensive or menacing in nature;
 - impersonate another person;
 - contains software viruses or any other computer code, files or programs designed to interrupt, destroy or limit the functionality of any computer resource;
 - threatens the unity, integrity, defence, security or sovereignty of India, friendly relations with foreign states, or public order or causes incitement to the commission of any cognisable offence or prevents investigation of any offence or is insulting any other nation.

A proposed amendment³⁶⁵⁷ to these Intermediary Guidelines seeks to further extend the above list and include information that:

- threatens public health or safety; promotion of cigarettes or any other tobacco products or consumption of intoxicant including alcohol and Electronic Nicotine Delivery System (ENDS) & like products that enable nicotine delivery, and
- threatens critical information infrastructure.

3655 https://meity.gov.in/writereaddata/files/GSR314E_10511%281%29_0.pdf

3656 Notified under clause (zg) of subsection (2) of section 87 read with sub-section (2) of section 79 of the Information Technology Act, 2000.

3657 draft Intermediaries Guidelines (Amendment) Rules, 2018; https://meity.gov.in/writereaddata/files/Draft_Intermediary_Amendment_24122018.pdf

These Guidelines also requires intermediaries, upon obtaining knowledge of any above-mentioned information, to act within 36 hours (the proposed amendment extends this to 72 hours) to disable such information. Further, intermediaries are required to follow the reasonable security practices and procedures as prescribed in the IT Security Rules 2011.

The intermediaries are also required to publish the name and contact details of the Grievance Officer as well as mechanism by which users or any victim of violation can notify their complaints. Such redressal should be done within one month from the date of receipt of complaint.

If the proposed amendment is adopted, intermediaries with more than five million users in India will have to be a company incorporated under Indian law with a permanent registered office in India and physical address. The amendment would also require such intermediary to appoint a nodal person in India for coordination with law enforcement agencies.³⁶⁵⁸

The IT Act also prescribes punishment for violation of privacy, though the 'privacy' here has a much narrower meaning constituting publication or transmission of images of private area of any person.³⁶⁵⁹ The Act provides powers to police officers to "enter any public place and search and arrest without warrant any person found therein who is reasonably suspected of having committed or of committing or of being about to commit any offence under this Act".³⁶⁶⁰

14.3.1.2. Draft Personal Data Protection Bill 2018³⁶⁶¹

Taking cognizance of the growing importance of data protection in India and the need to ensure growth of the digital economy while keeping personal data of citizens secure and protected, the Government of India on 31st July 2017 decided to constitute a Committee of Experts (the Committee) under the Chairmanship of Justice B N Srikrishna, Former Judge, Supreme Court of India, to identify key data protection issues in India and recommend methods of addressing them.³⁶⁶² The terms of reference included:

- To study various issues relating to data protection in India; and
- To make specific suggestions for consideration of the Central Government on principles to be considered for data protection in India and suggest a draft data protection bill.

Soon after the constitution of the Committee, the Supreme Court of India on 24th August, 2017 delivered its landmark judgement in the case of *Justice KS Puttaswamy and another vs. Union of India and others*, declaring "right to privacy" to be part of the fundamental

³⁶⁶² Vide Office Memorandum No.3(6)2017-CLES dated 31.07.17; https://www.meity.gov.in/writereaddata/files/MeitY_constitution_Expert_Committee_31.07.2017.pdf

“right to life” under Article 21 of the Constitution of India.³⁶⁶³ This judgement induced and added fuel to the public debate on data privacy and protection.

Towards the end of 2017, the Committee came out with a White Paper³⁶⁶⁴ on ‘Data Protection Framework for India’ and invited public comments³⁶⁶⁵ on it. It also conducted four country-wide stakeholders’ consultation meetings.³⁶⁶⁶ In July 2018, the Committee submitted to the Government its Report³⁶⁶⁷ titled “A Free and Fair Digital Economy – Protecting Privacy, Empowering Indians” along with a draft Personal Data Protection Bill (PDP Bill). Subsequently, the Government invited public feedback on the draft PDP Bill³⁶⁶⁸ and is still considering the draft and the government and approved by the Cabinet. The Bill will be introduced in the Parliament, and if passed will become the law of the land. The following paragraphs provide an overview of this draft PDP Bill.

(a) *Preamble:* The draft PDP Bill highlights that since right to privacy is a fundamental right, it is necessary to protect personal data. Further, recognising the criticality of use of data in the digital economy, the draft Bill seeks to “create a collective culture that fosters a free and fair digital economy, respecting the informational privacy of individuals, and ensuring empowerment, progress and innovation”.

Therefore, as per the draft Bill, it is expedient to make provisions with regard to the following:

- to protect the autonomy of individuals in relation with their personal data;
- to specify where the flow and usage of personal data is appropriate;
- to create a relationship of trust between persons and entities processing their personal data;
- to specify the rights of individuals whose personal data are processed; to create a framework for implementing organisational and technical measures in processing personal data;
- to lay down norms for cross-border transfer of personal data; to ensure the accountability of entities processing personal data;
- to provide remedies for unauthorised and harmful processing, and to establish a Data Protection Authority (the Authority) for overseeing processing activities.³⁶⁶⁹

(b) *Scope:* The draft PDP bill is proposed to apply to: (i) processing of personal data where such data has been collected, disclosed, shared or otherwise processed

3669 Preamble, Page 1, draft Personal Data Protection Bill, 2018 (PDP Bill)

within the territory of India, and (ii) processing of personal data by the State and any Indian person (natural or juristic). The law would also apply to the processing of personal data outside India, if such processing is in connection with any business carried on in India or which involves profiling of data principals within the territory of India.³⁶⁷⁰

(c) *Key definitions:* The draft Bill defines the following terms:

- “Data” means and includes a representation of information, facts, concepts, opinions, or instructions in a manner suitable for communication, interpretation, or processing by humans or by automated means”.³⁶⁷¹ Accordingly, “Personal data” means “*data about or relating to a natural person who is directly or indirectly identifiable, having regard to any characteristic, trait, attribute or any other feature of the identity of such natural person...*”³⁶⁷².
- “data principal” means natural persons who provide data used for data processing by firms;³⁶⁷³
- “data fiduciary” is a person who determines the purpose and means of processing of personal data;³⁶⁷⁴
- “data processor” means any person, including the State, a company, any juristic entity or any individual who processes personal data on behalf of a data fiduciary, but does not include an employee of the data fiduciary.³⁶⁷⁵ Accordingly, “processing” is defined as operation(s) performed on personal data, including operations such as collection, recording, organisation, structuring, storage, adaptation, alteration, retrieval, use, alignment or combination, indexing, disclosure by transmission, dissemination, restriction, erasure or destruction;³⁶⁷⁶
- “sensitive Personal Data” has been defined³⁶⁷⁷ as personal data revealing/ related to/ constituting passwords; financial data; health data; official identifier; sex life; sexual orientation; biometric data; genetic data; transgender status; intersex status; caste or tribe; religious or political belief or affiliation; any other category of data specified by the Authority.

(d) *Data protection obligations:* According to the draft PDP Bill, a person processing personal data has to process it in a fair and reasonable manner that respects the privacy of the data principal.³⁶⁷⁸ Personal data has to be processed not only for purposes that are clear, specific and lawful, but also for specified purposes (or inci-

³⁶⁷⁸ Section 4, draft PDP Bill.

dental thereto) that the data principal would reasonably expect the personal data to be used for.³⁶⁷⁹ The draft Bill provides limits the collection of personal data to data that is necessary for the purpose of processing.³⁶⁸⁰ It also obliges processing of personal data only on grounds of processing provided in the Bill.³⁶⁸¹ (see section below).

Under the draft Bill, the data fiduciary will have to provide certain information (notice) to data principal, in a clear and concise manner that is comprehensible to a reasonable person, at the time of collection of the personal data.³⁶⁸² Such information includes:

- the purposes for which the personal data is to be processed;
- the categories of personal data being collected; the identity and contact details of the data fiduciary and the contact details of the data protection officer, if applicable;
- if the personal data is intended to be processed on the basis of consent, the right of the data principal to withdraw its consent, and the procedure for such withdrawal;
- if the processing of the personal data is based on the given grounds, the basis for such processing, and the consequences of the failure to provide such personal data;
- if the personal data is not collected from the data principal, the source of such collection;
- the individuals or entities including other data fiduciaries or data processors with whom such personal data may be shared,
- if applicable; information regarding any cross-border transfer of the personal data that the data fiduciary intends to carry out, if applicable;
- the period for which the personal data will be retained; the existence of and procedure for the exercise of data principal rights;
- the procedure for grievance redressal; the existence of a right to file complaints to the Authority;
- any rating in the form of a data trust score that may be assigned to the data fiduciary; any other information as may be specified by the Authority.

The draft bill further provides that in order to maintain data quality, the data fiduciary has to take reasonable steps to ensure that personal data processed is com-

3679 Section 5, draft PDP Bill.

3680 Section 6, draft PDP Bill.

3681 Section 7, draft PDP Bill.

3682 Section 8, draft PDP Bill.

plete, accurate, not misleading and updated.³⁶⁸³ The data fiduciary is also required to retain personal data only as long as may be reasonably necessary to satisfy the purpose for which it is processed, unless explicitly mandated.³⁶⁸⁴ The data fiduciary is also responsible for the compliance of the given obligations and for demonstrating that any processing undertaken by it are in accordance with the Act.³⁶⁸⁵

(e) *Grounds for processing personal data:* According to the draft Bill, personal data can be processed on the following grounds:

- On the basis of “free, informed, specific, clear and capable of being withdrawn” ‘consent’ of the data principal;³⁶⁸⁶
- If necessary, for the functions of the State;³⁶⁸⁷
- in compliance with law or any order of any Court or Tribunal in India;³⁶⁸⁸
- if necessary, for prompt action (e.g. to respond to medical emergency, to assist during epidemic, disaster, breakdown of public order etc.);³⁶⁸⁹
- If necessary, for purposes related to employment;³⁶⁹⁰
- for any reasonable purposes, as may be specified after considering certain given conditions.³⁶⁹¹

The draft Bill also provides grounds for processing of sensitive personal data, which are on the same lines as above but a bit stricter. For instance, it requires ‘explicit’ consent before being processed,³⁶⁹² or if it is ‘strictly’ necessary for the functions of State,³⁶⁹³ or has been ‘explicitly’ mandated under law,³⁶⁹⁴ or to respond to any emergency situations (like medical emergency).³⁶⁹⁵ The draft Bill empowers the Authority to create further categories of sensitive data.³⁶⁹⁶

The draft PDP Bill also provides for personal and sensitive personal data of children. As per the Bill, if a data principal is below the age of eighteen they will be treated as ‘child’ for the purposes of the Bill.³⁶⁹⁷ Every data fiduciary will need to

3697 Section 3(9), draft PDP Bill.

process personal data of children in a manner that protects and advances the rights and best interests of the child and would have to set up appropriate mechanisms for age verification and parental consent. Certain data fiduciaries can be designated as 'guardian data fiduciaries' with added obligations.³⁶⁹⁸

(f) *Rights of data principal:* The draft Bill specifies a number of rights of data principal which may be exercised by the data principal only when s/he makes such request in writing to the data fiduciary (except right to be forgotten). These rights include:

- Right to confirmation and access:³⁶⁹⁹ confirmation whether the data fiduciary is processing the data; summary of personal data being processed; brief summary of processing activities.
- Right to correction:³⁷⁰⁰ Correction of inaccurate, misleading or out of date personal data; Completion of incomplete personal data.
- Right to data portability;³⁷⁰¹
- Right to receive personal data in a structured, commonly used and machine-readable format including personal data provided by data principal; data that has been generated in the course of provision of services or use of goods by the data fiduciary; data that forms part of any profile on the data principal or which the data fiduciary has otherwise obtained;
- Right to transfer the above-mentioned personal data to any other data fiduciary. This right only applies where the processing has been done through automated means and shall not apply where processing is necessary for functions of the State; or processing is in compliance of law; or the right to data portability would reveal a trade secret of any data fiduciary or would not be technically feasible;
- Right to be forgotten:³⁷⁰² Disclosure of personal data can be restricted by the data principal where such disclosure has served the purpose for which it was made or is no longer necessary or consent has been withdrawn or was made contrary to law.

(g) *Transparency and accountability measures:* The draft Bill has a long list of measures with respect to transparency and accountability that the data fiduciary has to follow. These include:

- every data fiduciary has to have 'privacy by design',³⁷⁰³ for which, among other things, it would need to implement measures to ensure the following: manage-

3698 Section 23, draft PDP Bill.

3699 Section 24, draft PDP Bill.

3700 Section 25, draft PDP Bill.

3701 Section 26, draft PDP Bill.

3702 Section 27, draft PDP Bill.

3703 Section 29, draft PDP Bill.

rial, organisational, business practices and technical systems are designed in a manner to anticipate, identify and avoid harm to the data principal; the data protection obligations mentioned above;³⁷⁰⁴ technology used in processing to be of certified standards; legitimate interests of businesses, including any innovation, is achieved without compromising privacy interests; privacy to be protected throughout the processing – from collection to deletion of personal data and the interest of data principal is accounted for at every stage; processing of personal data is carried out in a transparent manner.

- in order to maintain ‘transparency’, the data fiduciary would have to make the certain information available, including:³⁷⁰⁵ the categories of personal data generally collected and the manner of such collection; the purposes for which personal data is generally processed; the existence of and procedure for the exercise of the given rights of data principal; any rating in the form of a data trust score that may be accorded to the data fiduciary; information regarding cross-border transfers of personal data that the data fiduciary generally carries out.
- according to the draft Bill, the data fiduciary would have to maintain ‘security safeguards’ taking into account the risks associated with data processing, likelihood and severity of harm that may result from such processing.³⁷⁰⁶ Such measures should include methods such as de-identification and encryption; steps to protect the integrity of personal data; and steps to prevent misuse, unauthorised access to, modification, disclosure or destruction of personal data.
- in case of ‘personal data breach’, the data fiduciary would have to notify the Authority, along with certain given information, as soon as possible but certainly within a specified time period (to be decided by the Government). After receiving the notification, the Authority will determine whether such breach should be reported to the data principal.³⁷⁰⁷

Further, if processing involves new technologies or large scale profiling or use of sensitive personal data, data fiduciary will have to undertake a “data protection impact assessment” before commencing such processing.³⁷⁰⁸ Also the data fiduciary have to get its policies etc. audited annually by an independent data auditor.³⁷⁰⁹ Every data fiduciary will have a data protection officer to carry out various given functions.³⁷¹⁰ If data fiduciaries outsource the processing to other entities they are required to do so through a valid contract between them and the third party entities.³⁷¹¹

3704 See sections 4 to 11 of the draft PDP Bill.

3705 Section 30, draft PDP Bill.

3706 Section 31, draft PDP Bill.

3707 Section 32, draft PDP Bill.

3708 Section 33, draft PDP Bill.

3709 Section 35, draft PDP Bill.

3710 Section 36, draft PDP Bill.

3711 Section 37, draft PDP Bill.

There are provisions in the draft Bill whereby certain data fiduciaries or classes of data fiduciaries can be categorised as “significant data fiduciaries”³⁷¹², based on the following factors:

- volume of personal data processed;
- sensitivity of personal data processed;
- turnover of the data fiduciary;
- risk of harm resulting from any processing or any kind of processing undertaken by the fiduciary;
- use of new technologies for processing;
- any other factor relevant in causing harm to any data principal as a consequence of such processing.

Those categorised as ‘significant data fiduciaries’ are required to register themselves with the Authority and to undertake certain mandatory obligations such as data protection impact assessment.

As per the draft PDP Bill, every data fiduciary will have to put in place proper procedures and effective mechanisms to address grievances of data principals. Any grievance raised will have to be resolved in an expeditious manner and completed within 30 days from the date of receipt of grievance. If data principal is not satisfied, it can file a complaint to the ‘adjudication wing’ set up under the Act, whose orders are appealable to the Appellate Tribunal.³⁷¹³

(h) *Cross-border transfer of personal data:* Under the draft Bill, data fiduciaries have to ensure that at least one serving copy of personal data is stored on a server or data centre located in India.³⁷¹⁴ However, the government may exempt certain categories of personal data (not sensitive personal data) from this requirement. In addition, the government is also empowered to notify certain categories of personal data as ‘critical personal data’, which may only be processed in servers/data centres located in India.

General conditions under which cross-border transfer of personal data (not sensitive personal data) may take place include:

- If the transfer is made subject to standard contractual clauses or intra-group schemes that have been approved by the Authority;
- The Central Government, after consultation with the Authority, has prescribed that transfers to a particular country, or to a sector within a country or to a particular international organisation is permissible (if it finds that the relevant personal data shall be subject to an adequate level of protection);
- The Authority approves a particular transfer or set of transfers as permissible due to a situation of necessity;

³⁷¹² Section 38, draft PDP Bill.

³⁷¹³ Section 39, draft PDP Bill.

³⁷¹⁴ Section 40, draft PDP Bill.

- The data principal has consented to such transfer of personal data.
- (i) *General exemptions:* The draft Bill exempts, sometimes with conditions, the following activities from applicability of the main provisions of the Act.
- For the security of state personal data can be processed, but only if it is authorised by law and necessary for, and proportionate to, such interests being achieved;³⁷¹⁵
 - If disclosure of personal data is necessary for enforcing any legal right or claim, seeking any relief, defending any charge, opposing any claim, or obtaining any legal advice from an advocate;³⁷¹⁶
 - If processing of personal data is necessary for research, archiving, or statistical purposes;³⁷¹⁷
 - Personal data processed by a natural person for purely personal or domestic purpose;³⁷¹⁸
 - If the processing of personal data is necessary for or relevant to a journalistic purpose;³⁷¹⁹
 - If personal data is processed through means other than automated means by a small entity.³⁷²⁰
- (j) *Data Protection Authority:* The draft Bill, if becomes law, will establish a six-member Data Protection Authority, which will protect the interests of data principals, prevent any misuse of personal data, ensure compliance with the provisions of this Act, and promote awareness of data protection.³⁷²¹
- If there happens to be any concurrent jurisdiction of any other regulator upon any actions proposed by the Authority, the draft Bill requires that the Authority shall consult such regulator before taking such action. The Authority may also enter into a memorandum of understanding with such other regulator for coordination of actions.³⁷²² The draft Bill also mandates establishment of an Appellate Tribunal.³⁷²³
- (k) *Offences:* The draft Bill prescribes following acts as offences liable to imprisonment and/or pecuniary fines:

3715 Section 42, draft PDP Bill.

3716 Section 44, draft PDP Bill.

3717 Section 45, draft PDP Bill.

3718 Section 46, draft PDP Bill.

3719 Section 47, draft PDP Bill.

3720 Section 48, draft PDP Bill.

3721 Sections 49, 50 and 60, draft PDP Bill.

3722 Section 67, draft PDP Bill.

3723 Section 79, draft PDP Bill.

- Up to three years imprisonment and/or fine up to INR 0.2 million if a person knowingly or intentionally or recklessly, in contravention of the provisions of this Act:³⁷²⁴
 - obtains personal data; or
 - discloses personal data; or
 - transfers personal data to another person; or
 - sells or offers to sell personal data to another person.
- If such acts, as stated above, involve sensitive personal data, imprisonment can extend to five years and/or fine up to INR 0.3 million.³⁷²⁵

According to the draft Bill, in cases of offence committed by a company, every person in charge of, and responsible to, the company for such conduct shall be deemed to be guilty and would be liable to be proceeded against and punished accordingly.³⁷²⁶

(l) *Penalties and remedies:* The draft Bill contains varied penal provisions for various contraventions of its provisions. For instance, if data fiduciary contravenes (a) the obligation to take prompt and appropriate action in response to a data security breach, or (b) the obligation to undertake 'data protection impact assessment' or 'data audit' or 'appointment of a data protection officer' or 'failure to register with the Authority' by a 'significant' data fiduciary, it shall be liable to penalties up to INR 50million or two percent of its total worldwide turnover of the preceding financial year, whichever is higher.³⁷²⁷

Penalties to data fiduciaries can extend up to INR 150 million or four percent of total worldwide turnover, if they contravene any of following provisions:³⁷²⁸

- processing of personal data in violation of the provisions of Chapter II and Chapter III;
- processing of sensitive personal data in violation of the provisions of Chapter IV;
- processing of personal data of children in violation of the provisions of Chapter V;
- failure to adhere to security safeguards as per the Act;
- transfer of personal data outside India in violation of this Act.

Data fiduciaries would be liable to pay INR 5000/- per day if they fail to comply with requests made by data principal with respect to their rights assigned under the Act.³⁷²⁹ Data principals have the right to seek compensation from data fiduciary (or data processor) if they have suffered harm as a result of violation of any provision under this Act.³⁷³⁰

3724 Section 90, draft PDP Bill.

3725 Section 91, draft PDP Bill.

3726 Section 95, draft PDP Bill.

3727 Section 69(1), draft PDP Bill.

3728 Section 69(2), draft PDP Bill.

3729 Section 70, draft PDP Bill.

3730 Section 75, draft PDP Bill.

(m) *Others*: The draft bill confers on the Central Government the power to make 'rules'³⁷³¹, and on the Authority the power to make 'regulations'³⁷³² to carry out the purposes of the Act.

The draft Bill, if becomes law, would repeal sections 43A and 87(2)(ob) of the Information Technology Act, 2000.³⁷³³ Section 43A of the IT Act provides for compensation for failure to protect data. Section 87(2)(ob) of the IT Act empowers the Central Government to make rules with respect to "the reasonable security practices and procedures and sensitive personal data or information under section 43A".

14.3.1.3. RBI Notification on Storage of Payment System Data 2018

On 6th April 2018 the Reserve Bank of India issued a notification on Storage of Payment System Data³⁷³⁴ under Section 10(2) read with Section 18 of Payment and Settlement Systems Act 2007.³⁷³⁵ The notification states that: *"In order to ensure better monitoring, it is important to have unfettered supervisory access to data stored with these system providers as also with their service providers / intermediaries/ third party vendors and other entities in the payment ecosystem"*.

For this purpose, RBI decided that: "All system providers shall ensure that the entire data relating to payment systems operated by them are stored in a system only in India. This data should include the full end-to-end transaction details/information collected/ carried/ processed as part of the message/payment instruction. For the foreign leg of the transaction, if any, the data can also be stored in the foreign country, if required".

The system providers were given six months (till 15th October 2018) to comply with the new norm and were also required to submit System Audit Report by 31st December 31, 2018.

Despite deep resentment shown by many global players in the market, they have begun to comply with this data localisation norm. The criticism was largely focused on the nexus between the objective (to have unfettered supervisory access to data) and the measure suggested (data localisation) – is it necessary to store data locally in order to have unfettered access to data?

14.3.1.4. Press Note 2 of 2018 (FDI Rules on e-commerce)

The Consolidated FDI Policy 2017³⁷³⁶ (FDI Policy) clarified further by the Press Note 2 of 2018,³⁷³⁷ (PN2) forms the basis of regulating e-commerce from foreign investment perspective.

3731 Section 107, draft PDP Bill.

3732 Section 108, draft PDP Bill.

3733 Section 111, draft PDP Bill.

3734 <https://www.rbi.org.in/scripts/NotificationUser.aspx?Id=11244>

3735 <https://rbidocs.rbi.org.in/rdocs/Publications/PDFs/86706.pdf>

3736 https://dipp.gov.in/sites/default/files/CFPC_2017_FINAL_RELEASED_28.8.17_1.pdf

3737 https://dipp.gov.in/sites/default/files/pn2_2018.pdf

According to the FDI Policy, 100 percent FDI through automatic route is allowed for “Cash & Carry Wholesale Trading/Wholesale Trading”.³⁷³⁸ Further, as far as retail trading is concerned, the FDI Policy makes a distinction between ‘Single Brand Product Retail Trading’ (SRBT) and ‘Multi Brand Retail Trading’ (MRBT). While 100% FDI (automatic up to 49%, government route beyond 49%) is allowed in SRBT,³⁷³⁹ only up to 51% FDI is allowed in MRBT and that too through government route³⁷⁴⁰. (Government route means that prior approval of government is required for such FDIs; in automatic route no such prior approval is required).³⁷⁴¹ In addition, more stringent conditions apply to MBRT than SBRT.

PN2³⁷⁴² applies to e-commerce activities. It defines e-commerce as “buying and selling of goods and services including digital products over digital & electronic network”.³⁷⁴³ According to PN2, though 100% FDI is allowed in e-commerce activities through automatic route,³⁷⁴⁴ the foreign e-commerce entity (platform) can only engage in Business to Business (B2B) e-commerce and not in Business to Consumer (B2C) e-commerce.³⁷⁴⁵ For such B2B e-commerce, guidelines/conditions on cash and carry wholesale trading as given in the FDI Policy will apply.

Further, the PN2 distinguishes between inventory-based model³⁷⁴⁶ and marketplace-based model³⁷⁴⁷ of e-commerce. While 100% FDI under automatic route is permitted in marketplace model of e-commerce, no FDI is permitted in inventory-based model.³⁷⁴⁸ However, several conditions are also applicable, some of which are:

- Marketplace e-commerce entities can enter into transactions with sellers registered on its platform on B2B basis;³⁷⁴⁹
- E-commerce marketplace may provide support services (like warehousing, logistics, order fulfilment, payment collection etc.) to sellers,³⁷⁵⁰ but the same need to be in a fair and non-discriminatory manner;³⁷⁵¹

3738 Para 5.2.15.1 of the FDI Policy, 2017.

3739 Para 5.2.15.3 FDI Policy.

3740 Para 5.2.15.4 of the FDI Policy, 2017

3741 Para 5.2.15.4 FDI Policy.

3742 Issued on 26 December 2018 in order to provide clarity to FDI Policy on e-commerce sector and is in force since 01 February 2019.

3743 Para 5.2.15.2.2 (i) of PN2.

3744 Para 5.2.15.2 of PN2.

3745 Para 5.2.15.2.1 of 8PN2.

3746 As per para 5.2.15.2.2 (iii) of PN2, inventory -based model of e-commerce means an e-commerce activity where inventory of goods and services is owned by e-commerce entity and is sold to the consumers directly.

3747 As per para 5.2.15.2.2 (iv) of PN2, marketplace -based model of e-commerce means providing of an information technology platform by an e-commerce entity on a digital & electronic network to act as a facilitator between buyer and seller.

3748 Para 5.2.15.2.3 of PN2.

3749 Para 5.2.15.2.4(ii) of PN2.

3750 Para 5.2.15.2.4(iii) of PN2.

3751 Para 5.2.15.2.4(ix) of PN2.

- E-commerce entity providing marketplace will not exercise ownership or control over any vendor on its platform. Inventory of a vendor will be deemed to be controlled by e-commerce marketplace entity if more than 25 percent of purchases of such vendor are from e-commerce marketplace entity or its group companies;³⁷⁵²
- Entities, in which the group e-commerce entity or its group companies have equity participation or whose inventory is controlled by the e-commerce marketplace entity or its group companies, will not be allowed to sell its products on the platform of such marketplace entity;³⁷⁵³
- E-commerce entities providing marketplace shall refrain from influencing the sale price of goods or services, directly or indirectly, and shall maintain level playing field;³⁷⁵⁴
- E-commerce market-place entity will not mandate any seller to sell any product exclusively on its platform only.³⁷⁵⁵

14.3.1.5. Draft National e-Commerce Policy 2019

On 23rd February 2019, the Government of India (Department for Promotion of Industry and Internal Trade, Ministry of Commerce and Industry) issued draft National e-Commerce Policy³⁷⁵⁶ inviting stakeholders' comments (NEC Policy). The draft NEC Policy, bearing tag line "India's Data for India's Development", emphasizes the importance of data in the digital economy.

According to the draft NEC Policy, e-commerce includes "buying, selling, marketing or distribution of (i) goods, including digital products and (ii) services, through electronic network. Delivery of goods, including digital products, and services may be online or through traditional mode of physical delivery. Similarly, payments against such goods and services may be made online or through traditional banking channels i.e. cheques, demand drafts or through cash".³⁷⁵⁷

The draft NEC Policy addresses six broad issues of the e-commerce ecosystem – (i) data, (ii) infrastructure development, (iii) e-commerce marketplaces, (iv) regulatory issues, (v) stimulating domestic digital economy, and (vi) export promotion through e-commerce.³⁷⁵⁸ It identifies critical aspects of each issue and lays out strategies to achieve the Government's vision, which includes *inter alia* "protecting misuse of data" and "providing level-playing field to all stakeholders, including individual consumers and micro,

3752 Para 5.2.15.2.4(iv) of PN2.

3753 Para 5.2.15.2.4(v) of PN2.

3754 Para 5.2.15.2.4(ix) of 8PN2.

3755 Para 5.2.15.2.4(xi) of PN2.

3756 <https://dipp.gov.in/whats-new/draft-national-e-commerce-policy-stakeholder-comments>

3757 p9, draft NEC Policy; https://dipp.gov.in/sites/default/files/DraftNational_e-commerce_Policy_23February2019.pdf

3758 p9, draft NEC Policy.

small and medium enterprises (MSMEs) and start-ups”.³⁷⁵⁹ The draft policy recognises abuse of data as a major threat to the privacy of users, fair competition in the market and sustainability of MSMEs and start-ups. It seeks to create a regulatory environment to ensure that there is genuine competition in the market, which encourages entrepreneurship and innovation.

(a) *Data*: As far as ownership over data is concerned, the draft NEC Policy suggests that the companies having control of over data do not own the data which they process and monetise. The draft policy also treats ‘data’ as analogous to natural resources and states that “the data of a country, is best thought of a collective resource, a national asset, that the government holds in trust, but rights to which can be permitted”.³⁷⁶⁰

The draft NEC Policy further says that *“India and its citizens have a sovereign right to their data. This right cannot be extended to non-Indians. This understanding flows from the acknowledgement that data about an Indian, is his/her own. Even after anonymization, the interests of the individual cannot be completely separated from the derivatives that may be obtained by analysing and drawing inferences from a certain set of data. Data can, therefore, best be likened to a societal ‘commons’. National data of various forms is a national resource that should be equitably accessed by all Indians. The same way that non-Indians do not have access to the national resources on the same footing as Indians, non-Indians do not have equal rights to access Indian data. However, access to it can be negotiated, in national Interest.”*³⁷⁶¹

The draft NEC Policy also has flavour of proposing data localisation, which, according to it, is not only necessary for creation of high-value digital products in the country but also for creating local jobs. The draft policy calls for a timeframe for transition to data storage within India and gives a period of three years for industries to adjust to the data storage requirement.³⁷⁶² It proposes the following strategy with respect to cross border flow of data:³⁷⁶³

- Creation of a legal and technological framework to impose restrictions on cross-border data flow (including data generated by users in India on ecommerce platforms, social media, search engines etc.);
- Business entities that collect or processes any sensitive data³⁷⁶⁴ in India and stores it abroad will have to abide by the following conditions:
 - All such data stored abroad shall not be made available to other business entities outside India, for any purpose, even with the customer consent;

3759 p36, draft NEC Policy.

3760 p14, draft NEC Policy.

3761 p14-15, draft NEC Policy.

3762 See p18 of draft NEC Policy.

3763 See p16-17 of draft NEC Policy.

3764 The draft NEC Policy does not define ‘sensitive data’.

- All such data stored abroad shall not be made available to a third party, for any purpose, even if the customer consents to it;
- All such data stored abroad shall not be made available to a foreign government, without the prior permission of Indian authorities;
- A request from Indian authorities to have access to all such data stored abroad, shall be complied with immediately;
- Restrictions on cross-border flows of data shall not apply to the following:
 - Data that is not collected in India;
 - B2B data sent to India as part of a commercial contract between a business entity located outside India and an Indian business entity;
 - Software and cloud computing services involving technology-related data flows, which have no personal or community implications; and
 - MNCs moving data across borders, which is largely internal to the company and its ecosystem and does not contain data that has been generated by users in India.

The draft NEC Policy also calls for development of a “suitable framework for sharing of community data that serves larger public interest (subject to addressing privacy-related issues) with start-ups and firms”.³⁷⁶⁵

(b) Regulation of marketplace: According to the draft NEC Policy, the FDI Policy in e-commerce has been developed “to ensure that the marketplace provides a level playing field to all participants, while ensuring that distortionary effects, either through means of price control, inventory or vendor control does not happen”.³⁷⁶⁶ It also discourages capital dumping. Allowing FDI only in the ‘marketplace’ model (as against inventory-based model), the draft policy endeavours to mitigate threats to small offline retailers from foreign investors. It also discourages business models that are discriminatory favouring few online vendors over others.

The draft NEC Policy also demands that all e-commerce platforms available for download in India must have a registered entity in India. This, according to it, is important for ensuring compliance with laws for preventing deceptive and fraudulent practices, protection of privacy, safety and security.³⁷⁶⁷ The draft policy also requires e-commerce entities to make full disclosure to consumers regarding the ‘purpose’ and ‘use’ of data collected.³⁷⁶⁸

In order to prevent sale of counterfeit products, e-commerce entities have to undertake following measures:³⁷⁶⁹

³⁷⁶⁵ p17, draft NEC Policy.

³⁷⁶⁶ p19, draft NEC Policy.

³⁷⁶⁷ p20, draft NEC Policy.

³⁷⁶⁸ Para 3.8, p21, draft NEC Policy.

³⁷⁶⁹ Para 3.9 to 3.17, p21-22, draft NEC Policy.

- Full details of sellers for all products.
- An undertaking by the sellers to the platform about genuineness of products, which must be accessible to consumers. The platform shall enter into an agreement with each of the sellers on its platform, under which it shall obtain guarantee of authenticity and genuineness of the products sold by the seller, and also provide for consequences of violation of the same.
- E-commerce platforms to give options to trademark (TM) owners to register themselves, who will be notified whenever any product bearing the TM is offered for sale on the platform.
- E-commerce platforms shall not list or offer for sale, any of the TM owners' products without prior concurrence, if such owners desire.
- In certain products (such as cosmetics or goods having impact on public health), e-commerce marketplaces would have to seek TM owner's authorisation (that is, authorized/distributor/reseller agreement) before listing the product.
- Upon receiving complaint about a product being fake/counterfeit, the platform owner shall convey to the owner of the TM within 12 hours. In case of product being fake it would be removed from the list.
- Though post-sale, delivery of goods to the customers and customer satisfaction will be responsibility of the seller, there is a caveat to this. Since counterfeiting is a major concern, in case a customer makes a complaint to that effect, marketplaces would have liability to return the amount paid by the customer.
- Marketplaces should provide for creation of financial disincentives for sellers, if found to be selling counterfeit products (can also blacklist that seller).

The draft NEC Policy recommends the following anti-piracy measures and strategies:³⁷⁷⁰

- Intermediaries will have to put in place measures to prevent online dissemination of pirated content.
- If brought to notice by the owner of copyright protected content, the e-commerce platform (or website) will have to remove or disable access to copyrighted content being made available without prior permission of the owner.
- Creation of a body of industry stakeholder to identify 'rouge website', which can be included in 'Infringing Websites List' (IWL) after verification. Following measures can be taken on such websites:
 - Internet service providers will have to remove or disable access to the websites identified in the IWL;
 - Payment Gateways to stop flow of payments to such websites;
 - Search Engines to remove such websites, in their search results;
 - Stopping of hosting any advertisements on such websites.

³⁷⁷⁰ Para 3.18 to 3.20, p22-23, draft NEC Policy.

In addition to the above, the NEC Policy requires marketplaces to take the following measures:

- To ensure transparency and non-discrimination in publishing of ratings and reviews and to devise mechanisms to prevent fraudulent reviews and ratings by the sellers and their affiliates. All ratings and reviews should be published by the verified consumer.³⁷⁷¹
- Mandatorily display phone number and email address for consumer grievances as well as putting in place system of acknowledgment of consumer complaints with clear cut timelines for their disposal. First resolution to all consumer complaints must be provided within one week.³⁷⁷²
- To display list of products that are legally prohibited to be sold. In addition, sellers must provide an undertaking to the platform (accessible to the consumers) that they are not engaged in sale of prohibited products. In case it is found that such products are being sold, platform shall remove listing of such products within 24 hours. Such sellers can also be blacklisted, and the relevant authorities notified. Platform can also be made liable.³⁷⁷³

Furthermore, among other things, the draft NEC Policy also suggests that India should move towards electronic redressal of consumer grievances and use the concept of 'significant economic presence' for taxation purposes to determine allocation of profits of MNCs between 'resident' and 'source' countries. It also suggests review of the current practice of not imposing custom duties on electronic transmissions.³⁷⁷⁴

The draft NEC Policy also emphasises the importance of introducing measures to ensure responsibility and liability of platforms and social media to ensure genuineness of any information posted on the same.³⁷⁷⁵

The draft NEC Policy also flags the need for formulation of domestic industrial standards for smart devices and IoT devices to country's goal such as consumer protection, secured transactions, enhanced interoperability and ease-of-user interface.³⁷⁷⁶

Recognising that Artificial Intelligence, Big Data, deep learning etc. are going to take centre-stage in near future, the draft policy suggests that the Government should reserve its right to seek disclosure of source codes and algorithms. The draft policy specifically states that "there is a need to strike a balance between commercial interests and consumer protection issues, as well as issues of larger public concern, like preventing racial profiling and maintaining constitutionally mandated rights, such as the right to equality".³⁷⁷⁷

3771 Para 3.21-3.22, p23, draft NEC Policy.

3772 Para 3.23-3.25, p23, draft NEC Policy.

3773 Para 3.26 to 3.29, p23, draft NEC Policy.

3774 Page 27-28, draft NEC Policy.

3775 Page 29, draft NEC Policy.

3776 Para 5.1, p30, draft NEC Policy.

3777 Para 4.10, page 27, draft NEC Policy.

There has been widespread criticism of the draft policy, particularly the way it has treated 'data'. The government has received several comments and is presently reviewing these. A final policy on e-commerce is still awaited.

14.3.1.6. Draft e-Pharmacy Rules 2018

In August 2018, the Government of India (Ministry of Health and Family Welfare) published draft rules called as Drugs and Cosmetics (Amendment) Rules 2018.³⁷⁷⁸ These rules amended the Drugs and Cosmetics Rules 1945 in order to regulate the growing e-pharmacy. After receiving market. Government has invited stakeholder comments, on the government's draft 2018 Rules and the approved rules are yet to publish the final Rules.

According to the draft 2018 Rules, registration of e-pharmacy under Drugs and Cosmetics Act is mandatory and no person can distribute or sell, stock, exhibit or offer for sale of drugs through e-pharmacy portal unless registered. Following are the conditions of registration of e-pharmacy under the draft 2018 Rules:³⁷⁷⁹

- An e-pharmacy shall comply with provisions of Information Technology Act, 2000 and Rules made thereunder;
- The details of patient shall be kept confidential and shall not be disclosed to any person other than the Government;
- The supply of any drug shall be made against a cash or credit memo generated through the e-pharmacy portal and such memos shall be maintained by the e-pharmacy as record;
- The e-pharmacy shall not carry out online sale with respect to the narcotic and psychotropic drugs (as referred to in the Narcotic Drugs and Psychotropic Substances Act, 1985), tranquilizers and the drugs as specified in Schedule X of Drugs and Cosmetics Rules 1945.

The draft 2018 Rules further require that any information received by the e-pharmacy from the customer by way of prescription or in any other manner shall not be disclosed for any other purposes nor shall same be disclosed to any other person.³⁷⁸⁰ However, such e-pharmacy entity would be duty bound to share such information with the government as and when required for public health purposes.³⁷⁸¹ Most importantly, the draft 2018 Rules require that an e-pharmacy portal be established in India and data generated or mirrored through e-pharmacy portal not be sent or stored outside India.³⁷⁸²

3778 [http://www.cdsco.nic.in/writereaddata/2018_08_28_Draft%20GSR%20817\(E\)_Sale%20of%20Drugs%20by%20E-Pharmacy.pdf](http://www.cdsco.nic.in/writereaddata/2018_08_28_Draft%20GSR%20817(E)_Sale%20of%20Drugs%20by%20E-Pharmacy.pdf)

3779 Rule 67M draft 2018 Rules.

3780 Rule 67K Para (1) draft 2018 Rules.

3781 Rule 67K Para (2) draft 2018 Rules.

3782 Rule 67K Para (3) draft 2018 Rules.

In 2018, two High Courts – Delhi and Madras – heard petitions against online pharmacy portals and directed the Central Government to publish the final e-pharmacy rules. The Delhi High Court, on 12 December 2018, banned online sale of medicines without licence.³⁷⁸³

The Madras High Court, in first instance (Single Bench), had also banned the online sale of pharmacy till adequate regulations are in place, saying: *“as the draft rules are framed by the Central Government, after deliberations including the stakeholders, till the aforesaid rules are notified, the on-line traders are bound not to proceed with their on-line business in drugs and cosmetics”*.³⁷⁸⁴ This decision was appealed by aggregators who informed the court that they are not violating any rules or regulations under the Act.³⁷⁸⁵ The Division Bench of the Madras High Court hearing the appeal lifted the ban until such time as the petition was finally decided on merits.³⁷⁸⁶

In their submissions to the courts, the online pharmacies contended that their business model only sought to facilitate sale and purchase of medicines through their websites. They further stated that they only provide technology platforms, which merely connect consumers to third-party licenced pharmacies. They also stated that their system is designed in a manner that a request for prescription drugs would be rejected unless a valid prescription is uploaded by the customer.³⁷⁸⁷

These cases are still pending final decision in High Courts and the Indian government has still to publish the final rules. It may be noted however, that the draft 2018 Rules do not distinguish between inventory-based model and purely marketplace models of online pharmacy. The rules for the two are likely to be different, since the former directly sells drugs to consumers, while the latter only acts as an intermediary. Be that as it may, the online platforms for sale of drugs are operational in India, which suggests that they might have registered themselves as pharmacy. PharmEasy, MedLife, Netmeds, MedPlusMart, Practo etc. are among the many online pharmacy aggregators that are operating in India. These online pharmacies, however, together have only 1% of the total pharmaceutical sales, and brick and mortar pharmacies are responsible for 99% of pharma sales India³⁷⁸⁸.

14.3.1.7. Draft Digital Information Security in Healthcare Act 2017

In March 2018, Ministry of Health and Family Welfare (MoHFW), India circulated a draft Digital Information Security in Healthcare Act (DISH Bill or the draft Bill) for public com-

3783 http://delhihighcourt.nic.in/dhcqrydisp_o.asp?pn=299654&yr=2018

3784 W.P.No.28716 of 2018; <http://164.100.79.153/judis/chennai/index.php/casestatus/viewpdf/430085>

3785 There are two types of online pharmacies, one acting as aggregators who connect registered pharmacists and the consumer and the others which have their own registered pharmacists, medicine stocks and sales licenses under existing regulations. <https://inc42.com/buzz/madras-hc-stays-ban-on-online-sale-of-medicines-epharmacies-welcome-move/>

ments.³⁷⁸⁹ After inviting comments, the draft Bill was put on hold while the government awaited the report of the Justice BN Srikrishna Committee, mandated to propose a draft Bill on protection of personal data³⁷⁹⁰ (the draft Personal Data Protection Bill proposed by the Committee is still under consideration by the government). DISH Bill is believed to establish a regulatory regime for the creation of digital health records and their sharing between different hospitals and clinics.

Salient features of DISH Bill are as follows:

- The draft Bill aims *inter alia* to standardize and regulate the processes relating to collection, storing, transmission and use of digital health data; and to ensure reliability, data privacy, confidentiality and security of digital health data.
- Digital Health Data, according to the draft Bill, means an electronic record of health-related information about an individual and include the following information:³⁷⁹¹
 - concerning the physical or mental health,
 - concerning any health service provided,
 - concerning the donation any body part,
 - derived from the testing or examination of a body part or bodily substance,
 - collected in the course of providing health services, or
 - relating to details of the clinical establishment accessed by the individual
- DISH Bill establishes ownership to an individual over his/her digital health data and any clinical establishment etc. will hold such data in trust for the owner.³⁷⁹² Any other entity in custody of any digital health data shall be mere custodian of such data and will be duty bound to protect the privacy, confidentiality and security of such data. The ownership rights over their digital health data includes:³⁷⁹³
 - The right to privacy, confidentiality and security;
 - To refuse consent for the generation and collection (certain exceptions applies);
 - To give, refuse or withdraw consent for storage and transmission and to refuse consent to access and disclosure (certain exceptions applies);
 - To require explicit permission for each instances of transmission or use of digital health data in 'identifiable' terms;
 - To prevent any transmission or disclosure of 'sensitive health related information';³⁷⁹⁴

3790 <https://economictimes.indiatimes.com/tech/internet/health-ministry-may-await-disha-from-bn-srikrishna-report/articleshow/65098136.cms>

3791 Section 3(1)(e) of DISH Bill.

3792 Section 3(1)(j) and Section 31 of draft DISH Bill.

3793 Section 28 of draft DISH Bill; also see: https://www.medianama.com/2018/03/223-disha-electronic-health-records/?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed:+medianama+%28Medianama:+Digital+Media+In+India%29.

3794 According to Section 3(1) (o) of draft DISH Bill 'Sensitive health-related information' means information, that if lost, compromised, or disclosed, could result in substantial harm, embarrassment, inconvenience, violence, discrimination or unfairness to an individual, including but not limited to, one's physical or mental health condition, sexual orientation, use of narcotic or psychotropic substances, consumption of alcohol, sexual practices, Human Immunodeficiency Virus

-
- To ensure whether data collected are specific, relevant and not excessive;
 - To know who have access to their digital health data, and to whom the same is being transmitted or disclosed, and to be notified each time such data is being accessed;
 - To rectify any inaccurate or incomplete digital health data;
 - To ensure that in health emergency their digital health data be shared with their family members;
 - The right not to be refused health service, if they refuse to consent to generation, collection, storage, transmission and disclosure of their health data;
 - To right to seek compensation in cases of breach.
- The DISH Bill also provides of purpose-limitation on collection, storage, transmission and use of digital health data,³⁷⁹⁵ which can be done only for the following purposes:
 - To advance the delivery of patient centred medical care;
 - To provide appropriate information to help guide medical decisions at the time and place of treatment;
 - To improve the coordination of care and information among hospitals, laboratories, medical professionals, and other entities through an effective infrastructure for the secure and authorized exchange of digital health data;
 - To improve public health activities and facilitate the early identification and rapid response to public health threats and emergencies, including bioterror events and infectious disease outbreaks (only de-identified or anonymized data);
 - To facilitate health and clinical research and health care quality (only de-identified or anonymized data);
 - To promote early detection, prevention, and management of chronic diseases (only de-identified or anonymized data);
 - To carry out public health research, review and analysis, and policy formulation (only de-identified or anonymized data);
 - To undertake academic research and other related purposes (only de-identified or anonymized data);
 - According to draft DISH Bill, digital health data can be collected by consent from the owner and after informing the owner³⁷⁹⁶:
 - about his/her rights under the Act, including refusal to give consent;
 - the purpose of collection of such data;
 - the identity of the recipients to whom the health data may be transmitted or disclosed, and
 - the identity of the recipients who may have access to such digital health data on a need to know basis.

status, Sexually Transmitted Infections treatment, and abortion.

3795 Section 29 of draft DISH Bill.

3796 Section 30 of draft DISH Bill.

- Further, draft DISH Bill strictly prohibits access, use or disclosure of digital health data (whether in identifiable or anonymized form) by any other entity for a commercial purpose. It further prohibits the use of such data by employers, insurance companies, human resource consultants and pharmaceutical companies under any circumstances. Insurance companies can access digital health data only for the purpose of processing a claim of the owner.³⁷⁹⁷

14.3.1.8. The National Digital Communication Policy

In September 2018, the Government of India adopted the National Digital Communications Policy, 2018³⁷⁹⁸ ('NDC Policy' or 'the Policy'). This Policy replaces the National Telecom Policy of 2012 and, as its title suggests takes into account 'digital' communication as against mere 'tele' communication of the 2012 policy.

Among other things, the Policy seeks to promote and protect fair competition across the communications and digital economy sector. Its stated 'vision' is "to fulfil the information and communication needs of citizens and enterprises through the establishment of a ubiquitous, resilient, secure, accessible and affordable Digital Communications Infrastructure and Services and in the process, to support India's transition to a digitally empowered economy and society".³⁷⁹⁹ The core idea behind the policy is 'universal coverage' rather than revenue maximization.

The NDC Policy aims to accomplish the following strategic objectives by 2022:

- Provisioning of broadband for all;
- Creating 4 million additional jobs in the digital communications sector;
- Enhancing the contribution of the digital communications sector to 8% of India's GDP from 6% in 2017;
- Propelling India to the top 50 nations in the ICT Development Index of International Telecom Union (ITU) from 134 in 2017;
- Enhancing India's contribution to Global Value Chains;
- Ensuring 'digital sovereignty'.

The Policy envisages the following three 'missions' in order to achieve the above-said objectives by 2022:

- Connect India (creating robust digital communication infrastructure)—to promote Broadband for All as a tool for socio-economic development, while ensuring service quality and environmental sustainability.
- Propel India (enabling next generation technologies and services through investments, innovation and IPR generation)—to harness the power of emerging digital technologies, including 5G, AI, IoT, Cloud and Big Data to enable provision of future ready products and services; and to catalyse the Industry 4.0 by promoting investments, innovation and IPR.

³⁷⁹⁷ p 15, Privacy in Data Economy, PWC; <https://www.pwc.in/assets/pdfs/publications/2018/privacy-in-the-data-economy.pdf>

³⁷⁹⁸ <http://dot.gov.in/sites/default/files/EnglishPolicy-NDCP.pdf>

³⁷⁹⁹ Page 5, NDC Policy.

- Secure India (ensuring sovereignty, safety and security of digital communications—to secure the interests of citizens and safeguard the digital sovereignty of India with a focus on ensuring individual autonomy and choice, data ownership, privacy and security; while recognizing data as a crucial economic resource).

For enabling next generation technology, the NDC Policy suggests fostering an IPRs regime which promotes innovation and recommends a review of copyright, patents and trademarks regimes. It also asks for providing financial incentives for the development of Standard Essential Patents (SEPs) in the field of digital communications technologies as well as promoting Indian IPR through international collaborations and active participation in standard development processes.³⁸⁰⁰

The Policy also endeavours to maximise India's contribution to global value chains, by focussing on domestic production, increasing exports and reducing the import burden. This is sought to be achieved through the following measures/tools:³⁸⁰¹

- rationalising taxes, levies and differential duties to incentivize local manufacturing of equipment, networks and devices;
- introducing 'Phased Manufacturing Program' for identified product segments in Digital Communication Technologies;
- attracting and incentivizing global original equipment manufacturers (OEMs) and generic component players to setup manufacturing base in India;
- ensuring the availability of essential background IPR in Fair, Reasonable and Non-Discriminatory (FRAND) terms required for promoting local manufacturing;
- promoting design led manufacturing in India by leveraging indigenous software/ R&D capabilities;
- attracting global talent from Indian diaspora to create best in class enterprises.

The NDC Policy also flags acceleration of Industry 4.0 and suggests creation of a roadmap by 2020 and establishment of a multi-stakeholder led collaborative mechanism for coordinating transition to Industry 4.0.³⁸⁰² The Policy also calls for establishing a strong, flexible and robust data protection regime and harmonising communication law and policy with the evolving legal framework and jurisprudence relating to privacy and data protection in India. Further, in order to provide autonomy and choice for every citizen and enterprise, the Policy recognises the need to uphold the core principles of net neutrality. For this, it flags the incorporation of principles of non-discriminatory treatment of content and introduction of appropriate disclosure and transparency requirements.³⁸⁰³

Furthermore, the Policy recommends establishment of a Central Equipment Identity Registry for addressing security, theft and other concerns including reprogramming of identity of

3800 Page 15, NDC Policy.

3801 Page 16, NDC Policy.

3802 Page17, NDC Policy.

3803 Page 18, NDC Policy.

mobile handsets. It also calls for facilitation of lawful interception of all digital communications for national security.

In addition to the NDC Policy, the Government of India also has a National Policy on Software Products, 2019,³⁸⁰⁴ which envisions “to develop India as a Software Product Nation and a global leader in conception, design, development and production of intellectual capital driven Software Products, thus, accelerating growth of entire spectrum of IT Industry of the country”.

Further, a new consumer protection law – the Consumer Protection Act, 2019³⁸⁰⁵ – has been enacted in August 2019, which expressly defines ‘e-commerce’. According to the Act, “e-commerce” means buying or selling of goods or services including digital products over digital or electronic network³⁸⁰⁶ and “electronic service provider” means a person who provides technologies or processes to enable a product seller to engage in advertising or selling goods or services to a consumer and includes any online market place or online auction sites.³⁸⁰⁷

Furthermore, under this Act, government has published, for public comments, the e-Commerce Guidelines for Consumer Protection 2019.³⁸⁰⁸ These Guidelines would act as guiding principles for e-commerce business for preventing fraud, unfair trade practices and protecting the legitimate rights and interests of consumers and will apply to B2C e-commerce of goods and services. The Guidelines also contain liabilities of e-commerce platforms and sellers on such platforms. The Guidelines will be considered for adoption after taking into account the public comments.

14.3.2. Is there a digital strategy agenda in your jurisdiction? How this (if at all) relates to competition law and policy and what is the level of involvement of the competition authority (or authorities)?

Although there is no concrete digital strategy agenda in India, the overview of regulatory and policy framework, reveals certain elements of an overall digital strategy. Data is now being seen not only from ‘protection of privacy’ angle, but also as having immense economic value in digital economy. The thrust seems not only to deepen digital economy in India, but also to promote Indian players and platforms in the fast-growing digital economy. Key elements of digital strategy may be summarised as follows:

- Digital sovereignty – emphasis on digital sovereignty can be gathered from the NDC Policy and the draft NEC Policy. “If India’s economic, social and political interests in the emerging data economy are to be effectively secured, its ‘digital sovereignty’ encompassing the data privacy, choice and security of its

3808 <https://consumeraffairs.nic.in/sites/default/files/file-uploads/latestnews/Guidelines%20on%20e-Commerce.pdf>

citizens must be a prime consideration while participating in the global digital economy".³⁸⁰⁹

- Data localisation – make this localization policy work in establishment of data centres in India and subsequently help enhance access to consumers' data by Indian players (start-ups) for their scaling up to become globally competitive. India, being a huge market, generates sufficient consumer data to make players globally competitive. That is why there is a policy trend towards restrictions on cross-border flow of data.
- End monopoly over data – it seems India is moving towards policy in order to ensure that no entity enjoys monopoly over data. After data have been anonymized (to protect privacy of specific individuals), the same can be shared with other entities in the digital economy. Recently NITI Ayog, the government policy think tank, has made a proposal on these lines for fintech sector, which is likely to extend to other sectors like e-commerce, health, education etc.³⁸¹⁰
- Distinguishing between Indian players and foreign players – the policy direction in India suggests that in order to favour Indian players, regulations can differ for foreign and local players, particularly in sectors which do not allow 100% FDI is not allowed. There is a. One case is that of multi-brand retail sector in which there is regulatory discrimination between foreign e-commerce platforms and Indian platforms as far as B2C transactions are concerned: while inventory-model for foreign platforms is not allowed, there are no such restriction vis-à-vis domestic platforms.
- Monetize India's data – there are also talks about charging foreign players for access to India's data (on the lines of TRIPS-CBD Access-Benefit arrangements) or put some terms and conditions that could benefit Indian economy.
- Net neutrality – while India adheres to net neutrality principles, it does not seem to have taken cognizance of 'platform-neutrality' thus far. At present any kind of platform-to-business (P2B) regulation does not seem to be on the radar of policy makers. However, the judgement of the appellate tribunal on a competition case (All India Online Vendors Association vs. Flipkart, decided by the Competition Commission of India³⁸¹¹) is likely to trigger debates with respect to P2B regulations. Some buzz has also been created recently after the Commission had organised a workshop³⁸¹² on August 30, 2019, wherein platforms and their online business partners logged horn and questioned 'platform neutrality'³⁸¹³.

3809 Para 9, Preamble; page 2, NDC Policy; <http://dot.gov.in/sites/default/files/EnglishPolicy-NDP.pdf>

3810 NITI Ayog bats for ending data monopoly; Economic Times, May 17, 2019 <https://economictimes.indiatimes.com/news/economy/policy/niti-aayog-bats-for-ending-data-monopoly/articleshow/69364496.cms>

3811 Case 20 of 2018

3812 Titled: "E-commerce: Changing Competition Landscape in India"

3813 For instance, see this story: <https://the-ken.com/story/digital-platforms-perfect-storm/>

- Acceptance of regulatory sand-box – behaviour of regulators or competition authority is largely positive towards disrupting technologies. The approach is to allow it to take place whilst carefully monitoring the dynamics and intervening appropriately. However, it is important to bear in mind that there may be instances where interventions may be vitiated by the incumbent-led interest groups, for example in ride-sharing sector some states seem to be under influence of local taxi lobby. At least on one occasion in e-pharmacy sector judiciary has also been found to pass injunction order without clear understanding of the dynamics.
- Defensive approach as far as cross-border digital trade is concerned – India is among few naysayers to any WTO rules on e-commerce, and hence is reluctant to join the ongoing WTO plurilateral negotiations on cross-border e-commerce, saying it will reduce its policy space to address its socio-economic concerns.
- Use of ‘access to Indian digital market’ as *quid pro quo* for better bargaining in international trade and investment negotiations, also seems to be a tacit strategy of India.

On competition front, while there is no national competition policy in India (though there is one in draft form³⁸¹⁴), there is a competition law in form of the Competition Act, 2002, which does provide for advocacy function to be carried out by the Commission. Under this advocacy function, the emerging digital strategy agenda of India can be seen from competition lens and recommendations can be made whether elements of such strategy are pro-competition or are market distortive and hence against the principles of competition policy. Such recommendations can include alternatives that could be least restrictive in achieving the desired policy/regulatory objectives.

More so, the Competition Act, thus far, has been enforced without really distinguishing between digital and non-digital markets. However, off late, cognisance is being taken to address nuances of the emerging digital economy.

For instance, in Bayer-Monsanto deal, due to the Commission’s insistence, Bayer had to undertake for grant of access to Indian agro-climatic data (soil, climate, environmental, weather, moisture data, growing degree day and temperature data) used for their Digital Farming Product(s) or Digital Farming Platform(s), on fair, reasonable, and non-discriminatory terms and through non-exclusive, non-transferrable, non-sublicensable, royalty bearing licenses Bayer also had to undertake to connect to its digital platforms selling agriculture inputs to agricultural producers in India to potential Licensees.³⁸¹⁵ Bayer also had to undertake to grant access to Indian agro-climatic data collected by its digital platform, to government institutions free of charge.³⁸¹⁶

3814 http://www.mca.gov.in/Ministry/pdf/Draft_National_Competition_Policy.pdf

3815 Para 200, CCI order dated 14.06.2018 on Combination Registration No. C-2017/08/523; https://www.cci.gov.in/sites/default/files/Notice_order_document/Order_14.06.2018.pdf

3816 Para 201, *ibid*

By and large the Commission has largely refrained from adopting an overtly heavy-handed approach towards digital markets.³⁸¹⁷ A Competition Law Review Committee was set up in October 2018 to review the Competition Act and Rules/Regulations framed under the Act and suggest changes in law, if at all, required to cater the changing economic landscape. Public comments were also sought by the Committee³⁸¹⁸. The Committee submitted its Report³⁸¹⁹ to the government in August 2019, which includes a devoted section (Chapter 8) on competition concerns in technology and new age markets. The Report deliberates on the importance of ‘control over data’ and ‘network effects’ in competition analyses. Recommending very few changes in the Act (say for example taking ‘deal’ values in calculating threshold for merger notifications), the Committee largely found the provisions of the present law sufficient to deal with the competition nuances of the digital markets.

As far as the level of involvement of the competition authority is concerned, the same can be said not to be up to mark. Only one market enquiry on e-commerce³⁸²⁰ has been conducted by the Commission with respect to digital markets till date. The level of involvement of the Commission has been more or less satisfactory in dealing with cases in digital that came to it (competition cases with respect to digital markets are discussed below).

However, another relevant regulatory agency – Telecom Regulatory Authority of India (TRAI) – has been quite active in publishing white papers etc., which are being taken as part of the emerging national digital strategy of India.

14.3.3. What is protected by property rights (rights to exclude, transfer and monetise)?

14.3.3.1. Intellectual property rights (IPRs) in the digital economy

- (a) *Software patents*: Like most patent laws, under the Indian Patents Act patents can be granted to inventions (whether products or processes) in all fields of technology if they are ‘novel’, involves an ‘inventive step’³⁸²¹ and is ‘capable of industrial application’³⁸²². However, the Act under Section 3 provides a list of exclusions which are not inventions within the meaning of the Act. Such list contains “a mathematical or

3817 CCI Sets Foot Into the Digital Arena, But Still Has a Long Way To Go, The Wire, 18 April, 2018; <https://thewire.in/tech/cci-sets-foot-into-the-digital-arena-but-still-has-a-long-way-to-go>

3820 Interim observations of this market inquiry is here: https://www.cci.gov.in/sites/default/files/whats_newdocument/Interimobservations_30August2019.pdf

3821 As defined under Section 2(1)(ac) of the Patents Act, 1970

3822 As defined under Section 2(1)(ja) of the Patents Act, 1970

business method or a computer programme *per se* or algorithms”³⁸²³, thus rendering them not patentable.

In order to facilitate examination of increasing number of patent applications related with digital technology, Guidelines for Examination of Computer Related Inventions (CRIs)³⁸²⁴ was issued in 2016. According to the Guidelines, “focus should be on the underlying substance of the invention and not on the particular form in which it is claimed... If the substance of claims, taken as whole, does not fall in any of the excluded categories, the patent should not be denied”.

While the meanings of ‘mathematical method’ and ‘algorithm’ are in general quite simple and can easily be excluded, the interpretations of ‘business method’ and ‘computer programme *per se*’ could involve certain complexity.

According to the Guidelines, even if a claim involves “business methods” but if it specifies an apparatus and/or a technical process for carrying out the invention even partly, the claims shall be examined as a whole. Similarly, the legislative intent behind suffixing ‘per se’ to computer programme is that “sometimes the computer programme may include certain other things, ancillary thereto or developed thereon”³⁸²⁵ and hence patent could be granted if they are inventions.

The clarification by the Guidelines has led to granting of software patents, mainly those related with the ‘business methods’ of software and internet companies like Facebook, Apple and Google.³⁸²⁶

For instance, two patents were granted to Facebook and one each to Apple and Google in 2017, all related with business methods. First on a method “for generating dynamic relationship-based content, personalised for members of the web-based social network”³⁸²⁷ where Facebook successfully argued that the invention “implements a technical process and has a technical effect”³⁸²⁸. Second patent was granted on a method to share its user-profile data with third party applications on Facebook,³⁸²⁹ where in it stated that its invention was not merely a computer program as the said invention “includes hardware limitation and provides technical improvements and benefits like checking privacy setting associated with the user profile”³⁸³⁰.

3830 <https://www.firstpost.com/tech/news-analysis/software-patents-prohibited-under-indian-law-but-granted-in-spirit-3702725.html>

Apple obtained a patent on a 'method for browsing data items with respect to a display screen associated with a computing device and an electronic device'³⁸³¹ arguing that its invention brings about an "improved technical effect"³⁸³². Similarly, Google obtained a patent on an invention titled 'phrase identification in an information retrieval system' arguing successfully that the invention is neither a mathematical algorithm nor a computer programme *per se*, but provides a technical solution to a technical problem of how to automatically identify phrases in a document collection.³⁸³³

In sum, there are windows available for patent protection for Computer-related Inventions, otherwise computer software are largely protected under Copyright Act in India.

- (b) *Copyright Protection*: The Section 2(o) of the Copyright Act, 1957³⁸³⁴ defines "literary work", which includes computer programmes, tables and compilations including computer databases. As per Section 13 of the Act, original literary works qualifies for copyright protection. However, these literary works must be recorded into some tangible medium (form of expression of an idea) to get copyright protection³⁸³⁵.

Further, the copyright protection is available to computer program, in human-readable (source code) and machine-executable form (object code), as well as related manuals. That means unauthorised copying of source code and object code will be treated as piracy under the Act. However, copyright is not available for the methods and algorithms within a programme³⁸³⁶.

14.3.3.2. Are there any other property rights over data? Are data/algorithms subject to sui generis property rights?

As of now there is no property right over data or algorithms. However, the draft NEC Policy talks about sovereign rights over Indian's data. Similarly, the draft Personal Data Protection Bill does establish controls and rights of data principals over their data, but it is silent on 'ownership' or 'property rights' as such.

14.3.3.3. Rights of control and portability on personal data?

The draft PDP Bill, which will be a general regulatory regime for data protection if it

becomes law, talks about rights of data principal over their data, and includes right to portability (discussed above). According to the draft Bill, users have right to receive the following personal data in a structured, commonly used and machine-readable format:

- Personal data provided by data principal
- Data that has been generated in the course of provision of services or use of goods by the data fiduciary
- Data that forms part of any profile on the data principal or which the data fiduciary has otherwise obtained

14.3.4. Specific regulatory regimes

An overview of regulatory and policy framework relevant for digital economy has been provided in detail above.

14.3.4.1. Electronic communications

(a) Interoperability

There is no general regulation on interoperability, but the draft PDPB does have right to data portability and the use of phrase “structured, commonly used and machine-readable format” does takes it closer to interoperability. Apart from the telecom sector, in fintech sector, however, there are guidelines mandating interoperability of Prepaid Payment Instruments (PPIs)³⁸³⁷, which has bearing in the digital economy.

The PPIs Operational Guidelines for Interoperability, 2018 provides for: (i) interoperability of PPIs issued in the form of wallets through Unified Payments Interface (UPI), (ii) interoperability between wallets and bank accounts through UPI, and (iii) interoperability for PPIs issued in the form of cards through card networks.

There is an interoperability regulation on Set Top Box (for DTH and Cable operators) in the pipeline. TRAI had issued a consultation paper titled “Consultation Note on Solution Architecture for Technical Interoperable Set Top Box”³⁸³⁸ in Aug 2017.

(b) Network neutrality regulation and access regulation

According to the Department of Telecommunication (DoT), India, “government is committed to the fundamental principles and concepts of Net Neutrality i.e. keep the Internet accessible and available to all without discrimination. Internet Access Services, therefore, need to be governed by a principle that restricts any form of discrimination, restriction or interference in the treatment of content, including practices like blocking, degrading, slowing down or granting preferential speeds or treatment to any content”³⁸³⁹. In order to enforce this, the

3837 Prepaid Payment Instruments (PPIs) – Operational Guidelines for Interoperability, 2018; https://www.rbi.org.in/scripts/FS_Notification.aspx?id=11393&fn=9&Mode=0

3838 <https://main.trai.gov.in/broadcasting/stb-interoperability>

3839 <http://dot.gov.in/net-neutrality>

DoT came out with a Policy Directive in July 2018 depicting “Regulatory Framework on ‘Net Neutrality’”³⁸⁴⁰.

Earlier in February, 2016 the Telecom Regulatory Authority of India (TRAI) had notified “Prohibition of Discriminatory Tariffs for Data Services Regulation, 2016”, under Telecom Regulatory Authority of India Act, 1997. According to this Regulation, no service provider can offer or charge discriminatory tariffs for data services on the basis of content.³⁸⁴¹ It further bars service providers from entering into any arrangement, agreement or contract with any person that has the effect of “discriminatory tariffs for data services”³⁸⁴². There are penal provisions for the violation of this regulation.

(c) Price regulation

Though the Telecom Regulatory Authority of India (Amendment) Act, 2000 empowers TRAI to notify rates for telecommunication services, it has not used this power. Instead TRAI provides a regulatory oversight so that the tariff framework follows the broad regulatory principles of non-discrimination, transparency, non-predatory, non-ambiguous, not anti-competitive and not misleading.³⁸⁴³

14.3.4.2. Access to Data

(a) General regulatory framework

As discussed above, the draft Personal Data Protection Bill, 2018 has been proposed as a general regulatory framework to regulate access to data. At present, access to data is governed by the Information Technology Act, 2000, which has also been discussed above in detail.

- Interoperability

Instead of interoperability, the proposed draft PDPB empowers data principals with right to data portability in a “structured, commonly used and machine-readable format”. There seems to be no specific regulation (existing or proposed) as far as data interoperability is concerned.

- Non-discrimination

While the existing rules and regulations does not seem to have any discriminatory provisions with respect to access to data, the emerging policy and regulatory framework (see for example draft National e-Commerce Policy, 2018) does seem to discriminate between Indian and foreign persons with respect to access to data.

3840 http://dot.gov.in/sites/default/files/DoT%20Letter%20on%20Net%20Neutrality%20Regulatory%20Framework%20dated%2031%2007%202018_0.pdf?download=1

3841 Section 3, Prohibition of Discriminatory Tariffs for Data Services Regulation, 2016; https://main.trai.gov.in/sites/default/files/Regulation_Data_Service.pdf

3842 “discriminatory tariffs for data services” means charging of different tariffs by a service provider for data services based on the content accessed, transmitted or received by the consumer; Section 2(g), Prohibition of Discriminatory Tariffs for Data Services Regulation, 2016

3843 Page 5, *ibid*

- Price/rates regulation

There is no price or rate regulation, but net neutrality and competition is being ensured in data services by TRAI.

- Data portability

As discussed above.

(b) Sector-specific regulatory framework

A comprehensive overview of regulatory framework has been given in details above. In sum, at present there is one binding sector sector-specific regulation in form of the RBI Notification on Storage of Payment System Data, 2018 (discussed above), which mandates data localisation of entire data relating to payment systems – to be stored ‘only’ in India.

Few other sector specific regulatory framework related to access to data is in pipeline, such as Draft Digital Information Security in Healthcare Act, 2017 and draft e-Pharmacy Rules, 2018 (both has been discussed above).

- Algorithms/smart data

The IT Act, 2000 is the only binding general law at present that governs data from any source. The proposed draft PDPB is the upcoming general regulatory framework. On algorithms *per se*, India does not seem to have any general regulatory framework.

There, however, may be very few sector-specific regulatory frameworks on algorithm, for instance with respect to algo-trading, the Electronic Trading Platforms (Reserve Bank) Directions, 2018³⁸⁴⁴ was issued by the Reserve Bank of India. According to these Directions, any entity seeking authorisation as an Electronic Trading Platform (ETP) operator shall have to, *inter alia*, “obtain and maintain robust technology infrastructure with a high degree of reliability, availability, scalability and security in respect of its systems, data and network, appropriate to support its operations and manage the associated risks” (para 5(1)(c)(i) of the Directions).

For algorithmic systems, an ETP that provides algo trading will have to put in place a framework for testing and on-boarding of algo systems. And also ensure that such facilities are offered in a transparent and non-discriminatory manner as well as ensure that their systems and controls are adequate and effective for monitoring and managing risks arising from algo systems (para 7(1)(b)(iii) of the Directions).

(c) Institutional architecture

- Is there a digital platforms regulator?

No at present there is no digital platforms regulator, however, the Data Protection Authority under proposed draft PDPB will be an overarching regulator vis-à-vis personal data.

- Which sector-specific regulators are involved?

3844 <https://rbi.org.in/scripts/NotificationUser.aspx?Mode=0&Id=11385>

At present there is only one sector-specific regulator vis-à-vis payments, which include any digital platform in fintech sector. The regulator is Reserve Bank of India, which is relatively much independent from the Central Government. It has a Board of Directors, where government nominees are members, but it does not interfere in regulatory matters.

The TRAI, which predominantly is a telecom regulator, also has some powers to regulate certain aspects of digital communication. It is a statutory body, but government may intervene as per the TRAI Act. Though on regulatory matters, such government interferences are rare.

However, some more sector-specific regulations might come in near future, as has been discussed in regulatory and policy overview above.

(d) What is the role of the competition authority (authorities)?

The Competition Commission of India (CCI) is India's antitrust regulator. It was originally envisaged as a quasi-judicial body, which would conduct judicial proceedings generally based on complaints. Following a legal challenge, the CCI was recast from a primarily judicial body into a full-fledged regulator.

Its adjudicatory powers were modified from resolving adversarial disputes between business rivals to preventing practices having an adverse impact on competition. To supplement its role as an expert regulator, the CCI has proactive advisory and advocacy responsibilities.

The CCI has four statutory duties, viz:

- To eliminate practices having an adverse effect on competition in India;
- To promote and sustain competition in markets;
- To protect the interests of consumers; and
- To ensure freedom of trade carried on by other participants in markets in India.

The CCI may, on its own motion or on receipt of information from any person or on a reference made to it by a Government or a statutory authority, initiate an inquiry into an alleged contravention of the Competition Act, If it believes a *prima facie* case exists, the CCI must direct its Director General to investigate the matter. On the basis of the DG's investigation, the CCI may inquire into the matter and pass appropriate orders in the case of a contravention of the Act.

The CCI also regulates combinations. The Act prohibits any combination above a certain asset or turnover threshold, or if it is likely to cause an appreciable adverse effect on competition (AAEC) in the relevant market in India. The CCI has powers to approve a combination, modify terms of a combination, or direct that a combination shall not take effect.

The Commission is also empowered under the Act to perform advisory and advocacy functions. It may advise governments and statutory authorities on matters of competition, promote competition advocacy, create awareness and impart training about competition.

(e) What is the role of courts (generalist or specialised) in enforcing competition law and regulatory (structure, price and access regulation)?

Any appeal on the Commission's order lies at the National Company Law Appellate Tribunal. Generally, sector-specific regulations also have their own appellate bodies. Role of higher courts, in general, lies in deciding any points of law or points of constitutional law, apart from entertaining injunction suits.

(f) Interaction between competition law and regulation in the digital economy

- Competition authorities and general or sector-specific access and pricing regulators

The preamble of the Indian Competition Act empowers the Commission established under the act *to prevent practices having adverse effect on competition, to promote and sustain competition in markets, to protect the interests of consumers and to ensure freedom of trade carried on by other participants in markets, in India.*³⁸⁴⁵ In a similar vein, Section 60 of the Act confers an overriding effect on the provisions of the Act in times of inconsistency with other regulations. Therefore, the intention of the Act seems to be inclined towards giving the Commission authority to rule in the event of regulatory overlaps and conflicts.

As per Section 21 of the Act, a statutory body can make a reference to the CCI in the event of a decision that conflicts with the provisions of the Act. Initially, such reference could only be made at the request of a party. However, pursuant to the 2007 Amendments to the Act, a sectoral regulator can refer a matter to the CCI *suo motu* as well.

Mirroring the spirit of this Section, under Section 21A the Commission can refer a matter to the statutory authority for its opinion on the same. In both cases of reference, the agency has to render its opinion to the referring authority within 60 days of receipt of reference which is to be considered by the statutory or the competition authority. However, the opinions received from such consultations under Section 21 and 21 A are non-binding. Further, both the sections offer a 'may' provision thus making it optional for the agencies to consult each other.

While these sections seek to enhance mutual cooperation between competition authority and sectoral regulators, the non-binding and non-mandatory nature of consultations refutes the intended objectives. Moreover, owing to multiplicity of regulators in the country coupled with lack of clarity of their roles and functions, turf wars between the competition authority and sector regulators continue to persist.

Recently, in December 2018 the Supreme Court of India was faced with yet another issue of jurisdiction between the Telecom Regulatory Authority of India (TRAI) and the Competition Commission of India on who is best suited to decide on anti-competitive behaviour in the telecom sector. The Court observed, *"TRAI being a specialised sectoral regulator and also armed with sufficient power to ensure fair, non-discriminatory and competitive market in the telecom sector is better suited to decide the aforesaid issues"*.³⁸⁴⁶

3845 https://www.cci.gov.in/sites/default/files/ccj_pdf/competitionact2012.pdf

3846 https://www.sci.gov.in/supremecourt/2017/40072/40072_2017_Judgement_05-Dec-2018.pdf

The Supreme Court opined that the functions of TRAI and CCI are distinct from each other. The CCI is entrusted with duties, powers and functions to deal with anticompetitive practices that have an adverse effect on market competition to protect the interest of consumers and ensure freedom of trade. TRAI, on the other hand, is entrusted with regulation of telecom services for orderly and healthy growth of telecommunication infrastructure apart from protection of consumer interest. Since the case at hand pertains to the telecom market, which is specifically regulated by the TRAI Act, the court held that 'balance' will be maintained by permitting TRAI in the first instance to decide the 'jurisdictional facts'.

However, the Court did not altogether oust the jurisdiction of CCI and made its investigation subject to the findings of TRAI by stating as follows:

"Once that exercise is done and there are findings returned by the TRAI which lead to the prima facie conclusion that IDOs have indulged in anti-competitive practices, the CCI can be activated to investigate the matter going by the criteria laid down in the relevant provisions of the Competition Act and take it to its logical conclusion"³⁸⁴⁷

The judgment, while illuminating on the issue of competition v. sectoral regulators generally, and in the telecom sector specifically, leaves several grey areas worth consideration:

- There is a need for clear demarcation of roles and seamless distribution of powers of the sectoral regulator as well as the market wide regulator, while preserving the *raison d'être* of both the authorities.³⁸⁴⁸
- The order of the Supreme Court sends mixed signals as on one hand it seems to be deciding a logical flow of jurisdiction in matters involving specialised regulation as well as the CCI, on the other it seems to be abridging the authority of the CCI.³⁸⁴⁹
- It rules that the sectoral regulator, being an expert body, should first determine "jurisdictional facts", after which the CCI may determine if there is a violation of the Competition Act without defining the said 'jurisdictional facts'. In the present case, the central issue was whether the dominant incumbents are "acting unilaterally or collectively", one that raised a purely antitrust question. TRAI still remains to assess the jurisdictional aspects in this case perhaps due to lack of antitrust expertise.
- Introducing a two-tiered jurisdiction where first the sectoral regulator takes some decisions, and then CCI, after which an appeal lies to the NCLAT and then the SC, will introduce tremendous delays. It is possible that the parties might not be in business by the time a case is resolved.

3847 Ibid.

3848 http://www.cuts-ccier.org/pdf/Edition-11-Analysis_of_Competition_Cases_in_India.pdf

3849 Ibid.

The Report of the Financial Sector Legislative Reforms Commission³⁸⁵⁰ contains some useful recommendations with respect to inter-regulatory agency co-ordination, which include:

- Promoting formal co-ordination mechanisms amongst regulatory agencies;
- Coordinating the conduct of systemic-risk monitoring functions;
- Facilitating the adoption of common standards and practices in rule-making and enforcement;
- Helping to resolve inter-regulatory agency disputes.

(g) Competition authorities and data protection agencies

Currently there is no specific data protection agency in India. A Data Protection Authority has been proposed to be created under the draft Personal Data Protection Bill, 2018.³⁸⁵¹ This draft Bill along with a report³⁸⁵² was presented to the Ministry of Electronics and Information Technology on July 27, 2018 by the Committee of Experts under the Chairmanship of (Retired) Justice B. N. Srikrishna. The Bill is yet to be adopted by the Union Cabinet and placed before the Parliament.

(h) Competition authorities and digital consumer protection agencies (indicate if the competition authority is also functioning as a consumer protection regulator)

In India, the competition and consumer protection rules were initially combined under the Monopoly and Restrictive Trade Practices Act 1970. However, eventually with the enactment of Consumer Protection Act in 1986 and subsequently the Competition Act in 2002 there was a clear demarcation in legislations with distinct enforcement functions. However, both the laws deal with protection of interests of consumers directly (under consumer law) and indirectly (under competition law). A new Consumer Protection Act, 2019 has been passed, for which Rules are being framed and institutional set up is being processed. The new law covers all modes of transactions including 'offline or online transactions through electronic means or by telesshopping or direct selling or multi-level marketing' thus including the consumers of e-commerce platforms within its ambit.

(i) Interaction between competition law and IP rights

- Do IP rights benefit from an exemption regime?

As per Section 3(5)(i) of the Competition Act, a prohibition on anticompetitive agreements shall not restrict the right of any person to restrain any infringement of, or to impose reasonable conditions, as may be necessary for protecting his or her Intellectual Property (IP) Rights.

In order to clarify the scope of the section, the Competition Commission of India has observed that, '...the extent of non obstante clause in section 3(5) of the Act is not absolute as is clear from the language used therein and it exempts the right holder from the rigours of competition law only to protect his rights from infringement. It further

3850 https://dea.gov.in/sites/default/files/fslrc_report_vol1_1.pdf

3851 https://meity.gov.in/writereaddata/files/Personal_Data_Protection_Bill,2018.pdf

3852 https://www.meity.gov.in/writereaddata/files/Data_Protection_Committee_Report.pdf

enables the right holder to impose reasonable conditions, as may be necessary for protecting such rights.³⁸⁵³

Further, the Commission has explicitly stated that registration of an IP right does not automatically entitle a company to seek exemption under Section 3(5)(i) of the Act.³⁸⁵⁴ In order to be eligible for exemption, it is important to ascertain if the condition imposed by the IPR holder can be termed as *imposition of reasonable conditions, as may be necessary for the protection of any of his rights*.³⁸⁵⁵ Thus, the emphasis is on the term 'necessary' and the relevant question is *whether in the absence of the restrictive condition, the IPR holder would be able to protect his IPR*.³⁸⁵⁶

- Are there any IP related competition law guidelines?

Other than the provisions of the Competition Act of 2002, there is no secondary legislation/ guidelines concerning the application of competition law to IPRs.

- Succinctly summarise the main aspects of the guidelines

N/A

- Are there any sectors exempted from competition law enforcement?

No sectors are exempted from competition law enforcement in India. However, the Competition Act excludes *any activity of the Government relating to the sovereign functions of the Government including all activities carried on by the departments of the Central Government dealing with atomic energy, currency, defence and space* from its ambit.³⁸⁵⁷

However, under Section 54 of the Act, the Central Government has the powers to exempt enterprises from application of the Act.³⁸⁵⁸ For instance, in furtherance to its powers under this section, the Government has through notification exempt the following sectors from application of provisions of the Act:

- In June 2017, every person or enterprise who is a party to a combination as referred to in section 5 of the said Act was exempted from giving notice within thirty days mentioned in sub-section (2) of section 6 of the said Act, subject to the provisions of sub-section (2A) of section 6 and section 43A of the said Act, for a period of five years.³⁸⁵⁹
- In August 2017, all cases of reconstitution, transfer of the whole or any part thereof and amalgamation of nationalized banks were exempt from the ap-

3859 <https://www.cci.gov.in/sites/default/files/notification/S.O.%202039%20%28E%29%20-%2029th%20June%202017.pdf>

plication of provisions of Sections 5 and 6 of the Competition Act, 2002 for a period of ten years.³⁸⁶⁰

- In November 2017, all cases of combinations under section 5 of the Act involving the Central Public Sector Enterprises (CPSEs) operating in the Oil and Gas Sectors were exempt from the application of the provisions of sections 5 and 6 of the Act, for a period of five years.³⁸⁶¹

(j) Describe any reforms (recent or ongoing) of the competition law and related regulatory instruments (access, price regulation) undertaken the last 5 years as a result of the digitalisation of the economy and the emergence of digital platforms

In the year 2018-19, steps towards significant competition reforms were initiated by the Government of India in preparation for the digital economy.

- The Competition Law Review Committee (CLRC) to review the Competition Act, 2002

This Committee was constituted to strengthen and recalibrate Competition Law in India in view of the changing nature of the Indian economy. The terms of reference of the Committee are as follows:³⁸⁶²

1. To review the Competition Act/Rules/Regulations, in view of changing business environment and suggest necessary changes, if required;
2. To look into international best practices in the competition fields, especially anti-trust laws, merger guidelines and handling cross border competition issues;
3. To study other regulatory regimes/institutional mechanisms/government policies which overlap with the Competition Act;
4. Any other matters related to competition issue and considered necessary by the Committee.

The Committee had invited comments from stakeholders on the abovementioned terms of reference. The Committee has submitted its Report to the Government in August, was published on 26 July 2019.³⁸⁶³ The Report largely found the provisions of the present law sufficient to deal with the competition concerns in the digital economy, however, it highlights certain newer approach for competition analysis in order to deal with concerns of the new age markets. This newer approach, in general, tends to bestow more emphasis on 'control and access to data' and 'network effects'.

- The Draft National e-Commerce Policy 2019 (NEC Policy)

As discussed above.

- Draft Personal Data Protection Bill 2018 (PDP Bill)

As discussed above.

3860 <https://www.cci.gov.in/sites/default/files/notification/Notification%2030.08.2017.pdf>

3861 <https://www.cci.gov.in/sites/default/files/notification/Notification-22.112017.pdf>

3862 <http://pib.nic.in/newsite/PrintRelease.aspx?relid=183835>

3863 http://www.mca.gov.in/Ministry/pdf/ReportCLRC_14082019.pdf

(k) Have there been any studies commissioned or prepared? Please list them and briefly summarise their remit.

One market study on e-commerce is being conducted by the Competition Commission of India in partnership with Ernst & Young. Few interim observations, in form of ppt slides, have been uploaded on the Commission's website³⁸⁶⁴ and public comments have been invited on the same (till 30th September 2019). The interim findings of the market study on e-commerce in India, which looked into online food delivery, online hotel booking and online retail shopping suggests that there are certain areas that could give rise to competition concerns.

Compromise on 'platform neutrality' (due to inventory model/dual role of platforms) has been flagged in 'online food delivery' and 'online hotel booking' as well as also alleged in the online retail (despite FDI policy restricting it). Secondly, "opacity of the algorithms" (search, ads etc.) controlled and used by the platforms has been flagged as possible concerns. Further, the 'non-access of data' by the business partners (of their consumers) on the platform and use of data by platforms in promoting their own inventories have also been flagged as possible areas of concerns. Furthermore, 'unilateral and arbitrary' increase of commission (platform fee) and 'deep discounts by platforms posing added burden on businesses on platforms' have been posed as P2B concerns.

There are also few segment-specific concerns, for instance, in online food segment restaurants have allegedly been forced to use the platforms fleet for delivery. Similarly, the inquiry found presence of 'room and price parity restrictions' (MFN) and 'exclusive contracts' in hotel booking segment.

Another market study on media and broadcasting sector is also being considered by the Commission³⁸⁶⁵.

(l) Include any guidelines or legislative proposals made

The CLRC (see above) largely found the provisions of the present law sufficient to deal with the competition concerns in the digital economy. For instance, payment in form of 'personal data' can be considered under the present definition of 'price'. Similarly, existing framework under competition law is sufficient to deal with algorithmic collusion.

Though Committee found that vertical restraints via presence of MFN clauses can be dealt under the present framework under Section 3 of the Competition Act, it felt that "the scope of the Section 3(4) should be broadened to include 'other agreements' that causes or are likely to cause AAEC [appreciable adverse effect on competition] in India, and which do not strictly get covered under the horizontal and vertical arrangements currently envisaged under Section 3"³⁸⁶⁶.

The CLRC also deliberated if the Act (particularly Section 19(4)) should be amended to include 'control over data' and 'network effects' as factors for determining dominant

3864 https://www.cci.gov.in/sites/default/files/whats_newdocument/Interimobservations_30August2019.pdf

3865 <https://www.thehindubusinessline.com/news/cci-to-assess-media-broadcasting-sector-says-sources/article29270427.ece>

3866 Page 156 of the CLRC Report

position, and found that there is no need for any amendment since 'resources of enterprise' as mentioned in provision can include these. It also felt that the provision is inclusive and broad enough to include 'control over data' and 'network effects' as factors for determining dominant position.

As per the CLRC recommendation, the merger threshold provision, which is currently based on asset and turnover, may be amended to introduce 'size of transaction' or 'deal value' threshold in the merger control framework in the Competition Act.

For Details on CCI cases, please see eDigest BRICS case law.

Chapter 15: Country Report – China

Xianlin Wang, Fujing Zhan, Peicheng Wu, Xiang Fang

15.1 The Business and Technological Environment for the Digital Economy of China

15.1.1 Internet Access and Use in China

15.1.1.1 Internet User Size and Its Structure Distribution in China

15.1.1.1.1 Internet User Size in China

In 1994, through a 64K international line, China's Internet realized a full-featured connection with the international Internet, and China has entered the Internet era since then.³⁸⁶⁷ After more than 20 years of development and construction, China's Internet infrastructure has been continuously improved, and Internet construction and application have achieved leap-forward development. In 2006, China's Internet penetration rate exceeded 10% for the first time. Since then, the golden development period of China's Internet has been ushered in. The Internet penetration rate has increased rapidly. In 2009, it surpassed and began to lead the global average penetration rate. By 2015, China's Internet penetration rate has exceeded 50%. Benefiting from the size of its population, China has quickly become the world's largest Internet market. In 2016, the number of Internet users in China was 731 million, accounting for 21.5% of the total global user base. In the first half of 2017, the number of Internet users in China has reached 751 million, and the Internet penetration rate is 54.3% (45.9% globally).³⁸⁶⁸ As of June 2018, the number of Internet users in China was 802 million, and the Internet penetration rate was 57.7%. Among them, the number of mobile Internet users reached 788 million, accounting for 98.3% of all users of the Internet.³⁸⁶⁹

3867 See Liu Wei and Pan Yu: "Review of the Development of China's Internet in Twenty Years", New Media and Society, Issue No. 2, 2015.

3868 The data comes from "Analysis of the growth of user scale and traffic in China's Internet industry in 2018", <http://free.chinabaogao.com/it/201802/0226321AR018.html>, date of visit: January 25, 2019.

3869 The data comes from the 42nd Statistical Report on Internet Development in China published by China Internet Network Information Center, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

15.1.1.1.2 Age Structure of Chinese Internet Users

With the continuous and steady development of the Internet industry in China, especially with the growing popularity of the mobile Internet, the Internet has been deeply integrated with the lives of the Chinese people. Emerging industries such as mobile games, live broadcasts, and digital reading have become increasingly mature, and people's demand for high-quality content on the Internet has also increased. This can be evidenced by the distribution and development trends of the age structure of Internet users in China. In general, Chinese Internet users are mainly composed of adolescents, youth and middle-aged groups. As of June 2018, 70.8% of the total are the group aged from 10 to 39, among whom, those aged from 20 to 29 represented the highest proportion, reaching 27.9%; those from 10 to 19 and from 30 to 39 accounted for 18.2% and 24.7% respectively. In addition, the proportion of users aged from 30 to 49 has increased from 36.7% at the end of 2017 to 39.9%. All in all, the penetration of the Internet in the middle-aged population has strengthened.³⁸⁷⁰

Source: CNNIC China Internet Development Status Survey

Figure 1 Age Structure of Chinese Internet users

15.1.1.1.3 Gender Structure of Chinese Internet Users

As of June 2018, the proportion of male and female Internet users in China was 52.0%: 48.0%. According to data released by the National Bureau of Statistics, as of the end of 2017, the proportion of males and females in China was 51.2%: 48.83%. It can be seen that the gender structure of Chinese Internet users and the gender attributes of the population are basically the same.³⁸⁷¹

³⁸⁷⁰ The data comes from the 42nd Statistical Report on Internet Development in China published by China Internet Network Information Center, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

³⁸⁷¹ The data comes from the 42nd Statistical Report on Internet Development in China published by China Internet Network Information Center, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

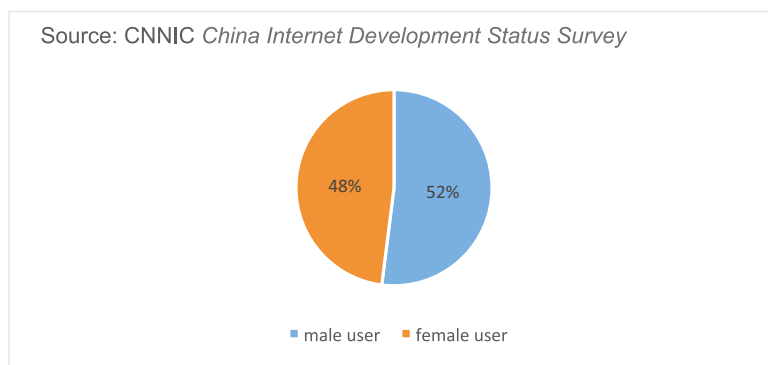

Figure 2 Gender Structure of Chinese Internet users

15.1.1.1.4 Urban-rural Distribution Structure of Chinese Internet Users

As of June 2018, the number of rural Internet users in China was 211 million, accounting for 26.3% of the total Internet users; the number of urban Internet users was 591 million, accounting for 73.7%; from the perspective of Internet penetration rate, the Internet penetration rate in urban areas was 72.7%, and the Internet penetration rate in rural areas was 36.5%. The penetration rate of the Internet in urban areas is significantly higher than that in rural areas. China's rural population is a major component of non-Internet users. Currently, the number of China's non-Internet users is 588 million, of which those in cities and rural areas account for 37.8% and 62.2% respectively.³⁸⁷²

Figure 3 Urban-rural Distribution Structure of Chinese Internet users

15.1.1.2 Availability of China's Internet Network

15.1.1.2.1 China Internet Network Coverage

In order to vigorously promote the development and popularization of the Internet, China is implementing the "Broadband China" strategy, launching the "more affordable Internet connection" campaign, and continuing to advance network infrastructure construction and evolution, as a result, access capabilities, service quality and applica-

³⁸⁷² The data comes from the 42nd Statistical Report on Internet Development in China published by China Internet Network Information Center, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

tion level of broadband networks have been significantly improved, the scale and level of construction of broadband networks are taking the lead internationally. as data released by the Ministry of Industry and Information Technology (hereinafter referred to as MIIT) shows, by the end of April 2018, China had completed fixed assets investment of 67.1 billion yuan in the construction of broadband networks. Across the nation, there were 40 million fiber-optic broadband ports newly added and 120,000 new 4G base stations were newly built, making the size total 3.4 million. China's 4G network had covered 95% of administrative villages and 99% of the population of the country, and more than 95% of administrative villages had gained access to fiber-optic broadband networks. At the same time, 550,000 access point devices have been deployed in 66,000 hotspots throughout the country, providing free Internet access in administrative service halls, transportation hubs, core business districts, tourist attractions, etc., and will continue to cover multiple hotspots in the next phase.³⁸⁷³ Chinese residents are enjoying the fruits of information communication and Internet development.

According to the goal set by the "Broadband China" strategy, by 2020, the gap on broadband network infrastructure development between China's and developed countries will be significantly narrowed, and Chinese nationals will fully enjoy the economic growth, service convenience and development opportunities brought by broadband. The broadband network will cover urban and rural areas across the board. The penetration rate of fixed broadband households will reach 70%, the penetration rate of 3G/LTE users will amount to 85%, and the proportion of broadband in administrative villages will exceed 98%. The broadband access capabilities of urban and rural households will reach 50 Mbps and 12 Mbps respectively, and some household users in developed cities can reach 1 Gbps per second. Broadband applications will be deeply integrated into industrial production and daily life, and the mobile Internet will achieve universal coverage. Technological innovation and industrial competitiveness will be brought to the advanced level, thus forming a sound network and information security system.³⁸⁷⁴

15.1.1.2.2 Network Operators Available to Chinese Consumers

There are three major network operators in China for consumers to choose from, namely China Mobile Communications Group Co., Ltd. (CMCC), China Unicom and China Telecom. As of the end of November 2018, the total number of mobile phone users of the three telecommunications companies had reached 1.56 billion. Among them, mobile broadband users (ie 3G and 4G users) totaled 1.3 billion, accounting for 83.6%; 4G users remained at 1.16 billion, accounting for 74.3%. The total number of fixed Internet broadband access users of the three enterprises reached 405 million, of which 365 million were FTTH/O users, accounting for 89.9% of the total number of fixed Internet broadband access users.³⁸⁷⁵

3873 "China's 4G network covering 99% of the population and 95% of the administrative village enjoying access to fiber-optic broadband", http://www.xinhuanet.com/city/2018-06/11/c_129891657.htm, date of visit: January 18, 2019.

3874 Notice of the State Council on Printing and Distributing the "Broadband China" Strategy and Implementation Plan, http://www.gov.cn/zwqk/2013-08/17/content_2468348.htm, date of visit: January 26, 2019.

3875 "Economic Operation of the Communications Industry in November 2018", <http://www.miit.gov.cn/newweb/n1146285/>

In addition, in recent years, the virtual network operators (VNO) has emerged in China to provide consumers with more choices. The VNO carries out the mobile communication resale business. By contracting the use rights of some communication networks of three companies, the VNO uses its own billing system, customer service number, marketing and management system to sell communication services to consumers. In late 2013 and early 2014, MIIT successively issued two batches of virtual carrier licenses to 19 private enterprises for pilot operation, effectively advancing the speed-up and fee reduction of the Internet and spurring innovation in the telecommunications industry. On April 28, 2018, the MIIT officially issued a document, and decided, for the further development of the mobile communication resale business, to allow private, state-owned, or foreign companies to apply for formal commercialization instead of pilot operation starting on May 1, 2018. The MIIT emphasizes that the wholesale pricing of the basic operators offer to resellers should be lower than the average unit price or package price of the same services of the basic operators, and encourages the resellers to implement the national strategies of “Internet Plus” and “Digital Economy”, use their advantageous resources and capabilities to engage in innovations of service and business models as well as develop and apply new technologies in the IoT industry.³⁸⁷⁶ In the foreseeable future, the involvement of virtual network operators will promote innovation in China’s Internet and mobile communications services, and enhance competition and service levels in the mobile communications market.

15.1.1.2.3 The Ownership of and Regulation over Chinese Network Operators

All three major network operators in China are state-owned enterprises under the administration of the State-owned Assets Supervision and Administration Commission of the State Council (hereinafter referred to as the SASAC). The SASAC, as authorized by the State Council, performs the duties as the investor in accordance with the laws and administrative regulations, particularly the *Company Law of the People’s Republic of China*, and supervises the central enterprises (excluding financial ones) including the three network operators and undertake management responsibilities in respect of the state-owned assets of these companies. As telecommunications companies, these network operators are also subject to industry supervision and management from the MIIT, the regulator of the national information industry. According to the *Regulations of the People’s Republic of China on Telecommunications*, the MIIT’s regulation of telecommunications enterprises covers including business licensing, tariff management, service quality, equipment access and security guarantee. Additionally, the MIIT also administers the Internet industry (including the mobile Internet), coordinates the construction of telecommunications networks, the Internet, and private communication networks, promotes the joint development and sharing of network resources, and guides the self-discipline of telecom and Internet-related industries and the development of related industry or-

n1146352/n3054355/n3057511/n3057518/c6551116/content.html, date of visit: January 18, 2019 day.

3876 Notice of the Ministry of Industry and Information Technology on the Official Commercialization of Mobile Communication Resale Business, <http://miit.gov.cn/n1146285/n1146352/n3054355/n3057674/n4704636/c6153600/content.html>, Date of Visit: 2019 On the 18th.

ganizations. In May 2011, Cyberspace Administration of China (hereinafter referred to as the CAC) was formally established. Its main responsibilities include implementing the national Internet information dissemination policy and promoting the rule-making of the Internet information dissemination, as well as guiding, coordinating and urging relevant departments to strengthen the content management of Internet information and investigate and punish illegal websites, and investigate and deal with illegal and illegal websites according to law. The MIIT has assigned the duty of the original informatization promotion and network information security coordination to the CAC.³⁸⁷⁷

It is worth noting that Chinese network operators enjoy the status of utilities, and their market operations are regulated by the national market supervision department. In fact, since the promulgation and implementation of *Anti-monopoly Law* of the People's Republic of China in 2008, anti-monopoly law enforcement agencies have conducted a number of anti-monopoly investigations on the telecommunications market, involving China Mobile, China Telecom, China Unicom and other telecommunications giants, relating to such monopolized conducts as tied-in fixed telephones with broadband business, clearing traffic at the end of the month, and mandatory use of service items in the package. All the case investigations have been suspended after the telecom operators involved in various localities made a rectification commitment to the anti-monopoly law enforcement agencies. Since then, all three operators have launched a series of "more affordable Internet connection" policies of networks for the benefit of consumers. China's anti-monopoly law enforcement agencies have emphasized in the investigation of a number of state-owned telecom giants that large state-owned enterprises will not be free from anti-monopoly law enforcement because of their special role in the national economy; instead they should also value the importance of complying with anti-monopoly law.

15.1.1.2.4 Affordability of China's Internet Network

The Chinese government stresses that in order to develop Internet and information industry, it is necessary to implement the people-centered development thinking and provide the people with useful, affordable and good-to-use information services, so that hundreds of millions of people can share their Internet development achievements and have a greater sense of gain. In order to meet the expectations and needs of the people, the Chinese government has been committed to the development of the Internet in recent years. Since 2015, telecom companies have started a large-scale "more affordable Internet connection" operation, and the average tariff rates of fixed broadband and mobile traffic have dropped by more than 50% and 39% respectively.³⁸⁷⁸

As the infrastructure construction and broadband speed improve, and network costs

3877 See Notice of the State Commission Office on the Responsibilities and Institutional Adjustments of the Ministry of Industry and Information Technology, <http://www.miit.gov.cn/n1146285/n6496186/c3722500/content.html>, date of visit: January 26, 2019 day.

3878 See "Xi Jinping: Providing Affordable, Useful Information Services to our People", <http://www.chinanews.com/gn/2016/04-26/7849160.shtml>, date of Visit: January 26, 2019.

continue to decrease, access and cost issues are no longer the main factors that plague the Chinese people in using the Internet. Even in remote areas, fiber-optic broadband access and high-quality networks are becoming more and more popular. Meantime, domestic long-distance and roaming charges for mobile phones have been canceled, and international long-distance fare reduction has also been put on the agenda, and the access fees for SME Internet private lines have been significantly reduced.³⁸⁷⁹

15.1.1.2.5 China Internet Access Service

According to the *Telecom Service Classification Catalogue (2015 Edition)* issued by the MIIT, China's Internet access service mainly refers to the use of access servers and corresponding software and hardware resources to establish service nodes, and the use of public telecommunications infrastructure to connect business nodes with the Internet backbone network to provide Internet access services for all types of users. The users can connect to his service node by means of a public communication network or other access means, and access the Internet through the node. At present, the main types of Internet access services and their development status in China are as follows.³⁸⁸⁰

(1) Internet Service Provider Service (ISP Service³⁸⁸¹). According to the China Academy of Information and Communications

Technology (CAICT), as of the end of August 2017, there were 3,296 ISP-licensed enterprises in China. Among them, 1,306 cross-regional businesses were licensed by the MIIT and 1990 local companies were licensed by communications administration bureaus of their respective provinces, autonomous regions, or municipalities.³⁸⁸²

(2) Internet Data Center Service (IDC Service). The IDC service refers to the provision of the placement, agent maintenance, system configuration and management services for the Internet or other network related devices such as the user's server by means of the corresponding computer room facilities, and the provision of rental services of equipment including database systems and servers and their storage space, as well as agent lease of communication lines and egress bandwidth and other application services. As of October 2017, there are 1,417 IDC-licensed companies in China.³⁸⁸³ Driven by the national strategies of "Internet Plus", big data, digital economy, state policy guidelines and the rapid development of the mobile Internet, China's IDC business revenue had

3879 See "How to Capitalize on the Opportunities as China's Internet Enters a New Era of Development?", the People's Daily, November 27, 2017, edition 1.

3880 See Liu Qing, Wu Hao: "Research on Internet Access Service Management in China", in Modern Telecom Technology, issue No. 4, 2015.

3881 China's ISP business mainly refers to the use of access servers and corresponding software and hardware resources to establish service nodes, and the use of public telecommunications infrastructure to connect business nodes with the Internet backbone network to provide Internet access services for all types of users.

3882 "The Number of ISP-licensed Enterprises in China as of August 2017", https://www.sohu.com/a/204213019_654915, date of visit: January 26, 2019.

3883 See "China's IDC Industry Developing Rapidly and 1417 Companies Obtaining IDC Licenses", <https://fiber.ofweek.com/2017-12/ART-210022-8120-30183024.html>, visit date: January 26, 2019.

continued to grow rapidly. As estimated by CAICT's Data Center White Paper (2018), the total revenue of China's IDC industry reached 65.04 billion yuan in 2017, of which the traditional IDC business income stood at 51.28 billion yuan, accounting for 78.8% of the total revenue of IDC.³⁸⁸⁴

(3) Internet Resource Collaboration Service (Cloud Service). In recent years, cloud computing has become a basic platform for China's Internet innovation and entrepreneurship. The State Council issued the *Opinions on Promoting the Innovation and Development of Cloud Computing and Cultivating the New Business Forms of the Information Industry* in 2015. The opinions sought to clarify the ideas and goals of cloud computing development in China and encourage government at all levels to explore the use of cloud computing to meet the needs of e-governance and public services and guide the migration of e-governance to a new generation of governance based on cloud computing platforms so as to drive the growth and expansion of the entire domestic cloud service market. According to CAICT's Data Center White Paper (2018), China's cloud service revenue reached 13.76 billion yuan in 2017. With the implementation of the "Enterprise Cloud" initiative, it is expected that the proportion of cloud service revenue in China's IDC business revenue will continue to rise.³⁸⁸⁵

(4) Content Distribution Network Service (CDN Service). CDN service refers to the formation of a traffic distribution and management network platform through the use of node server groups distributed in different areas to provide users with decentralized storage and high-speed cache of content; and the distribution of content to a fast and stable cache server according to network dynamic traffic and load conditions to improve the access response speed of the user content and availability of services. The scale of China's CDN market has continued to grow rapidly in recent years. In 2016, the market totaled 11 billion yuan; and its coverage rate reached 17.2%, which is far lower percentage when compared with that in mature markets in North America.³⁸⁸⁶ In 2017, China's CDN market rose to 13.61 billion yuan. With the emergence of various new types of networking services such as live broadcast, short video, AR and AI, CDN will usher in an even larger market. It is expected that the market will approach 25 billion yuan in 2019, with a growth rate of over 35%.³⁸⁸⁷ At present, there are three main types of CDN suppliers in China: the first type is traditional professional CDNs represented by Shanghai Wangsu Science & Technology Co., Ltd., China Cache and Dnion. They provide professional CDN services for the enterprises that build their own servers. The second type is CDN acceleration on the cloud platform. Representative companies are Alibaba Cloud, Tencent Cloud and Jinshan Cloud. The third type is the CDN innovators. They mainly

expand the node through P2P technology and intelligent hardware to achieve unlimited nodes. The leading business of this type is Thunder Star Domain.³⁸⁸⁸

15.1.2 Overview of China's Digital Economy Development

15.1.2.1 Overall Situation of China's Digital Economy Development

In order to speed up the construction of “Digital China”, the Chinese government has done a lot, including actively implementing the “Internet Plus” initiative and advance the implementation of the “Broadband China” strategy and the national big data strategy. In addition, a number of strategic actions and major projects will be launched, 5G R&D applications will be promoted, and an IPv6 scale deployment action plan will be implemented. China's digital economy is entering the fast lane, and the “Digital China” strategy has achieved world-renowned achievements. According to the *China Digital Economy Development and Employment White Paper (2018)* released by the CAICT in March 2018, in the year of 2017, the size of China's digital economy reached 27.2 trillion yuan, a nominal year-on-year growth rate of more than 20.3%, far higher than the GDP growth rate of the year, was achieved, and the digital economy accounted for 32.9% of GDP, with an increase of 2.6 percentage points year-on-year. Thus the digital sector has become the core driving force for China's economic growth and job creation. In 2017, Preliminary calculations showed that 171 million people were working in the digital economy of China, accounting for 22.1% of the total employment.³⁸⁸⁹

15.1.2.2 Construction and Development of China's Smart Cities

In 2012, the Ministry of Housing and Urban-rural Development (hereinafter referred to as MOHURD) issued the *Notice on the Pilot Work of National Smart Cities*. It was just in this document that the Chinese government first proposed the development of smart cities. In it smart cities were defined as a new model for integrating information resources, coordinating business application systems and strengthening urban planning, construction and management through the integrated use of modern science and technology. The document also included the "Interim Administrative Measures for National Pilot Smart Cities" and "An Indicator System of the National Pilot Smart Cities (Districts, Towns) (Trial)" which were designed to encourage eligible localities to actively apply for the status of pilot cities (districts, towns). Since 2013, the MOHURD has announced three batches of 290 pilot cities (districts, towns) in China. When the initial development period of 3 to 5 years was over, the MOHURD and other competent authorities will organize assessments of these pilot cities (districts, towns), and then rate those pilot cities that have passed the assessment into three levels: one-star (the lowest level), two-star and three-star (the highest level).

Thanks to favorable policies, the development of smart cities in China has achieved remarkable results in first-tier cities and developed second-tier cities, and corresponding industries such as intelligent transportation, smart healthcare, and smart home will also benefit. Take Zhejiang Province for instance, through cooperation with companies like Hangzhou-based Alibaba Group, Ant Financial Services Group and NGARihealth, smart city services such as "Internet Plus governance", "Internet Plus transportation", "Internet Plus healthcare" and "Smart Police" can now be widely provided in Hangzhou and other major cities in Zhejiang. These cities, in terms of the penetration rate of mobile, cashless payment, are taking the lead in the world. In addition, the development of smart cities is rapidly spreading to other second and third-tier cities (districts, towns). Apart from efforts made by pilot cities, many non-pilot cities are also planning to build smart cities. China's "13th Five-Year Plan" has clearly specified that there were more than 500 smart cities, and the number would continue to increase.

Meanwhile, the Internet and urban public service system have also entered a new stage of integrated development with each other, given the fact that the Internet has markedly increased the efficiency of public service provision. As of June 2018, online government service users in China reached 470 million, accounting for 58.6% of the total Internet users. Among these e-government service users, 42.1% used Alipay or WeChat city service platform. In fact, the two platforms have become the most commonly used channels to enjoy e-government services; the government WeChat public account came as the third one of importance, with the usage rate being 23.6%. The usage rates of government websites, government mobile applications and government microblogs were 19.0%, 11.6% and 9.4% respectively.³⁸⁹⁰ With E-government, urban public services have become more effective it is more convenient for companies and individuals to obtain information and handle transactions.

3890 The 42nd Statistical Report on Internet Development in China, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

15.1.2.3 Main Financing Channels for Chinese Digital Economy Enterprises

According to the *World Internet Development Report 2018* and *China Internet Development Report 2018*, in the country, in 2017, the digital economy generated a revenue of 27.2 trillion yuan, and it contributed 55% to GDP growth.³⁸⁹¹ In the list of Forbes of Global Top 100 Digital Economy Entities, 16 companies were from Chinese mainland, second only to the United States. The Chinese government has clearly stated that it will give priority to the building of a stronger China both in network technology and digital economy in the country's economic and social development. To this end, the government has increased support for financing policies for digital economy companies, like deepening the reform of the New Three Board, encouraging private equity and venture capital funds to invest in the digital economy, and developing the capital market to spur innovation and entrepreneurship in the digital economy.³⁸⁹² Specifically, the financing channels of China's digital economy companies mainly include the following:

The first is raising funds from social investors through stock issuance. The China Securities Regulatory Commission (CSRC) supports the listing and financing of innovative companies representing "new technologies, new industries, new forms, and new models", while improving the efficiency of IPO and refinancing audits for digital economic enterprises. From 2017 to August 2018, a total of 493 companies completed the IPO, raising funds of 319.972 billion yuan, the IPO of high-tech companies reached 80%, and the digital economy has grown as a major component.³⁸⁹³ The second is achieving capital integration through mergers and acquisitions. The CSRC has significantly reduced the institutional costs of mergers and acquisitions and encourages mergers and acquisitions to be conducted "between upstream and downstream in the same industry". From 2017 to August 2018, listed companies in the information transmission, software and information technology services industry implemented a total of 424 mergers and acquisitions, with a transaction amount of 485.09 billion yuan. The merger targets include "big data", "Internet of Things", "artificial intelligence", etc. The main area of the digital economy. The third is promoting the formation of long-term capital and support the innovation and entrepreneurship of the digital economy through the development of private equity investment and venture capital funds.³⁸⁹⁴ The fourth is government investment. On September 18, 2018, China Development Bank and the National Development and Reform Commission signed the *Development-oriented Financial Cooperation Agreement for Comprehensive Support of Digital Economy Growth*, planning, in the next five years, to invest 100 billion yuan to support the key projects in the fields of big data,

3891 "The Output Value of the Digital Economy Reaching 1 Trillion and the Value of Investing in Big Data Companies Turning Apparent", <http://money.163.com/18/1221/11/E310TJA80025814V.html>, date of visit: January 20, 2019.

Internet of things, cloud computing, new smart cities, and digital silk roads.³⁸⁹⁵

15.1.3 Overview of China's E-commerce Development

E-commerce is an important part of the digital economy and one of the most active and representative forms in the digital economy. In recent years, against the backdrop of booming development of digital economy in China, e-commerce has stepped into a new round of innovation and growth. With the government policies and driven by the market, China's e-commerce development is now more focused on efficiency, quality and innovation, and has become a new engine of China's economic growth. On May 29, 2018, the Ministry of Commerce released the *China E-Commerce Report (2017)*. The report shows that in 2017, China's e-commerce transaction volumes reached 29.16 trillion yuan, with an increase of 11.7% year-on-year. Among them, the commodity e-commerce transaction volume was 16.87 trillion yuan, a year-on-year increase of 21.0%; the service e-commerce transaction volume was 4.96 trillion yuan, a year-on-year increase of 35.1%.

Figure 5 Total E-commerce Volumes and Year-on-year Growth Rates in China from 2011 to 2017

Meanwhile, the development advantages of China's e-commerce continue to amplify, with its online retails size being the world's largest and enthusiasm of innovation leading the world. According to the National Bureau of Statistics, as of the end of 2017, in China, the number of online shopping users reached 533 million, a year-on-year increase of 14.3%; the amount of online payment made through non-bank payment institutions reached 143.26 trillion yuan, a year-on-year increase of 44.32%; 40.06 billion parcels were delivered by couriers, a year-on-year increase of 28%; E-commerce workers employed directly and indirectly totaled 42.5 million people. The structure of China's e-

³⁸⁹⁵ "Investing 100 billion in five years to vigorously promote the development of the digital economy, <https://baijiahao.baidu.com/s?id=1611926461387340632&wfr=spider&for=pc>, date of visit: January 20, 2019.

commerce market has continuously moved for the better, and the quality of industry development continued to improve. And service transactions have been taking a growing share in e-commerce volumes. In 2017, corporate transactions accounted for 60.2% and individual transactions accounted for 39.8% in the e-commerce business, both of them still enjoying the momentum of growth. The contribution rate of online retails of physical commodities to the total retail sales of social consumer goods reached 37.9%, playing a more powerful role in driving consumption. The online retail sales of rural areas increased by 39.1% year-on-year, while the online retail sales of agricultural products increased by 53.3% year-on-year. Rural e-commerce helped make “selling rural products” much easier and promoted the upgrading of the country’s agricultural structure. The cross-border e-commerce merchandise exported subject to the inspection at the Customs recorded a growth rate of 41.3%, and the way in which these products went global has increasingly become important in Chinese merchandise exports.³⁸⁹⁶

With the integration of e-commerce with social applications and digital content, and the growth of mobile payment, the enthusiasm of Chinese consumers to participate in e-commerce is increasing, and online business transactions such as shopping, food take-out, and travel booking are growing rapidly. As of June 2018, the proportion of online shoppers and other users paid online accounted for 71% of the total Internet users (70.7% of these shoppers and payers were mobile online shoppers totaling 557 million); thus the Internet shopping and payment has become a popular way commonly used by netizens in China. 364 million buyers ordered their food online with a year-on-year increase of 6.0% compared with the end of 2017, spurring the development of related industries. With emerging technologies such as big data and artificial intelligence, the leading food delivery platforms had made logistics and distribution far more efficient. As of June 2018, there were 393 million Chinese consumers booking air tickets, hotels, train tickets and travel and holiday products through the Internet, about an increase of 17.07 million and a growth rate of 4.5% when compared with the end of 2017.³⁸⁹⁷

15.1.4 Overview of China’s Social Network Development

15.1.4.1 The Main Social Networking Platform Currently Popular in China

The development of social networks in China has experienced three stages: infancy (1999-2004), rise (2005-2007), and popularity (2008-present).³⁸⁹⁸ With the use and promotion of China Mobile’s 4G communication network, the number of mobile phones and other mobile terminal devices is increasing, and it has gradually replaced PCs, form-

3896 Source: China E-Commerce Report 2017, <http://dzsws.mofcom.gov.cn/article/ztxx/ndbg/201805/20180502750562.shtml>.

3897 Source: The 42nd Statistical Report on Internet Development in China, http://www.cac.gov.cn/2018-08/20/c_1123296882.htm.

3898 “Analysis of the Status quo of the Social Networking Industry in 2018 and the Further Increase of Internet Users Helping Expanding Domestic Scale”, <https://www.qianzhan.com/analyst/detail/220/180517-58ca9378.html>, date of visit: January 29, 2019.

ing a new social network trend – mobile social networks. According to statistics, mobile phones and other portable terminal devices has become the most frequently used application for mobile Internet users to carry out social networking. With Mobile network social networking as a communication platform, Chinese online social networking has become more mobile, real-time and convenient.³⁸⁹⁹ Mobile social networking applications represented by instant communication ones have fostered large-scale loyal users as they meet the life, social, emotional and informational needs. Various social networking platforms also attract different user groups through different product positioning. For example, in the social field of acquaintances, Tencent's QQ is focused on catering to the entertainment-oriented features of young users, while WeChat continues to enhance the functionality of small programs, connecting users and retail, e-commerce, life services, government and people's livelihoods online and offline. In the social networking among strangers, Momo occupies an important market position. In addition, the size of users of social products used in office scenarios, represented by DingTalk and corporate WeChat, continues to grow.

WeChat is a network platform for Tencent's integrated real-time communication, entertainment social and life services launched in 2011. Users can realize various forms of instant communication by sending voice, pictures and text information. The "moments" function can enable users to share wonderful moments in their life and promote social networking among acquaintances. In addition, it also has "game center" and "WeChat payment" to provide users with more entertainment and recreation possibilities, as well as life experiences. The "Public Platform" also allows each user to build their own brand. WeChat is gradually evolving from a communication tool to an open platform that connects various industries.

QQ space is a social networking product derived from Tencent's instant messaging tool QQ. It was developed and officially launched in 2005. It has been loved by many Chinese netizens. Now it has grown into a social platform that accommodates all kinds of relationship chains of netizens. It can meet the demand for display, communication and entertainment and is committed to creating an open platform for the Chinese Internet, and, together with third-party websites, to providing excellent and personalized social networking services for Chinese netizens.

Weibo, also known as the Chinese version of twitter, enables users to access through multiple mobile devices such as PCs and mobile phones, to realize instant sharing and information communication in multimedia formats including texts, pictures and videos. In 2009, Sina.com launched the "Sina Weibo" beta, becoming the first portal website to provide Weibo services.³⁹⁰⁰ As a form of social media, benefiting from the influence of celebrities, superstars and media content ecology, as well as the vigorous development of short videos and mobile live broadcasts, Weibo is very popular among Chinese

3899 Qin Rui: "The Rise and Development of China's Social Network", in *Journal of Chifeng College (Natural Science Edition)*, issue No. 17, 2016.

3900 Weibo refers to Sina Weibo, although there are other Weibo products such as Tencent Weibo, NetEase Weibo, Sohu Weibo, etc., unless indicated otherwise.

netizens. It is worth mentioning that many government departments have also opened government microblogs for collecting opinions, listening to public opinion, publishing information, serving the public, and building a communication platform of social participating in political discussion through interaction with the public.

15.1.4.2 User Aggregation and Homing of Social Network Platforms

Since a variety of mobile social applications can meet the different needs of users, users will therefore choose applications depending on different scenarios and the image they hope to present. In general, Chinese Internet users implement multi-homing related to social networks. According to the *Insight Report China Mobile Social Users 2017* released by iResearch, there were 5.4% of users using only one mobile social application; 36.7% of users using three mobile social applications, and 30.3 % using two mobile social applications; and still 9% of users who use even more than five mobile social applications. The report also showed that three kinds of social networking were most often chosen: integrated, interest-oriented and picture-based.³⁹⁰¹

Figure 6 the Number of Mobile Social Applications used by Chinese Mobile Social Users in 2017

Among the types of mobile social applications, integrated app, interest-oriented app, picture-based app, business app and campus app were ranked among the top five, among which integrated app and interest-oriented app were the most commonly used ones and firmly occupied the leading position in mobile social networking and social products such as business and dating apps would receive more attention.³⁹⁰²

Figure 8 Types of Social Applications Most Commonly Used by Chinese Mobile Social Users in 2017

15.1.5 Overview of China's Internet of Things and Industry 4.0 Development

15.1.5.1 Status Quo of China's IoT Development³⁹⁰³

Since the introduction of "Smart Earth", the concept of the Internet of Things has been rapidly recognized on a global scale and has become the core driving force for a new round of technological revolution and industrial transformation. In recent years, information and communication technologies represented by the IoT are accelerating their transformation into real productivity—evolving from simple tools and products to the infrastructure and key factors reshaping the way of production and organization. The ICTs have profoundly changed the traditional industrial form and people's lifestyle and generated a large number of new technologies, products and models, which thus trig-

3903 CAICT: "Internet of Things White Paper (2016)", <http://www.cac.gov.cn/files/pdf/baipishu/wulianwang2016.pdf>.

gering a wave of global digital economy. With the top-level design of the Chinese government and the unremitting efforts of various localities and departments, the IoT has entered a new phase of deep integration with traditional industries. The development of the Internet of Things has achieved remarkable results. The transformation and upgrading of industrial manufacturing is becoming a major driver of the Industrial Internet of Things. An important driving force for development. In terms of user and industry scale, according to the MIIT, as of the end of June 2018, the number of final IoT users in China had reached 465 million, and the scale of the Internet of Things has exceeded one trillion yuan. The IoT cloud platform has become a crucial area of competition. In terms of the standard systems, the IoT Integrated Standardization System Guidelines were formulated, and more than 900 standard items were reviewed. International IoT standards including IoT reference architecture, intelligent manufacturing, electronic health indicator evaluation, IoT semantics and big data, were set and published. In terms of industrial layout, the four major regional clusters in the Bohai Sea, the Yangtze River Delta, the Pan-Pearl River Delta as well as the central and western areas came into being. The initial success was in the development of national-level IoT industrial bases such as Wuxi, Chongqing, Hangzhou and Fujian. Such IoT Industrial Parks in Beijing, Shanghai, Shenzhen and Chengdu were booming robustly. In addition, China's technological innovation in the key links of the Internet of Things continued to advance, and its industrial capabilities kept improving, as shown in the following aspects.

(1) China is actively leading the global NB-IoT standards and industry development. Huawei proposed the demand for NB-IoT (narrow-band IoT) at the 3GPP International Organization for Standardization, worked with Ericsson and Qualcomm to develop the globally influential NB-IoT standard, and finally released the standard in June 2016. The NB-IoT technology received recognition and commitment from the global LTE industry, and the industry chain is in the process of being formed. Chinese operators proposed their own NB-IoT commercial plans, and the production and commercialization of NB-IoT products is accelerating.

(2) The sensor market is growing rapidly and the local industry chain is becoming more complete. Driven by IoT applications, China's sensor market reached 110 billion yuan in 2015. It is expected to reach 211.5 billion yuan by 2020, with a compound annual growth rate of 14%. At present, China's sensors for IoT applications have basically covered several categories such as sports, environment and optics and dozens of specific fields, and quite a few internationally renowned manufacturers have emerged. At the same time, the sensor industry innovation system has kept improving, with its means of industrial organization quickly shifting into the virtual IDM model featured by specialized division of labor.

(3) Local players begin to transform from discrete device manufacturers to systemized solution providers. In order to meet the flexible, intelligent and integrated development needs of the Internet of Things, and to increase the added value of sensor products, local manufacturers have constantly strengthened their ability to provide integrated solutions.

(4) China Gradually takes an advantageous position in some IoT international standardization organizations. China's Internet of Things standardization has continued to play an active role, leading the formulation of standards in some important areas. First, Chinese experts have held some important positions in the standardization organizations which serves as a good foundation for promoting relevant standards led by China. As of March 2016, in the related fields of Internet of Things, such as OneM2M, 3GPP, ITU, IEEE, etc., China has obtained relevant leadership position in standardization organizations involving more than 30 IoT-related standards, and presided over the standardization work in some fields, effectively enhancing the global impact of China. Second, some domestic entities have actively initiated projects, and China has become an important force in advancing the standardization of the Internet of Things. Chinese companies have continued to carry out technological innovation and standard investment, and have worked with developed countries to set standards in the areas such as IoT wireless wide area communication network, web-based IoT service capabilities, wearable devices, and connected vehicles. These efforts have promoted the development of global mobile IoT infrastructure and business applications. Third, China has gradually established its dominant position in setting important standards, particularly in the fields of IoT semantics, IoT big data, and IoT gateways, etc.

15.1.5.2 China Industry 4.0 – “Made in China 2025”

In the context of the global industry entering the era of 4.0, the Chinese government proposed “Made in China 2025” in 2015, which is the action plan of the Chinese government to implement the first decade of the strategy of build a stronger manufacturing industry in China. “Made in China 2025” is also known as “Chinese Edition of Industry 4.0”. It is a development plan formulated in response to meet the needs of transforming and upgrading the manufacturing industry against the background of major changes in the economic environment of China.

In contrast with German “Industry 4.0” and the U.S. “National Strategic Plan for Advanced Manufacturing”, the goal and mission of “Made in China 2025” are about improving the innovation capability and quality of manufacturing through the transformation and upgrading of traditional industries. This is in line with the development foundation and realistic conditions of China's manufacturing industry. This strategy proposes to adhere to a basic policy that is “innovation-driven, quality-first, talent-oriented and featured by green development and structural optimization”; and follow a basic principle that is “market-led, government-guided; about seeking both short and long-term interests, focusing on key areas while taking a holistic approach, and carrying out win-win cooperation while enhancing independent development capabilities.”

According to the action plan, to achieve the “Made in China 2025” goal, we must complete the “Nine Major Tasks” and implement the “Five Major Projects.” The various tasks involved in “Made in China 2025” have generated staged results, playing an important role in stabilizing industrial growth and accelerating the transformation and upgrading of the manufacturing industry, but at the same time, they also face many difficulties and

problems. The Chinese government will improve the manufacturing development environment, pragmatically promote international exchanges and cooperation, and use bilateral and multilateral cooperation mechanisms to strengthen the alignment of “Made in China 2025” with industrial development strategies of other countries in order to jointly meet the challenges brought about by the new round of scientific and technological revolution and industrial transformation and achieve win-win cooperation.

The *Trend Report on Patents Involving Ten Key Technical Fields* of “Made in China 2025” issued by the Intellectual Property Center of the National Industrial Control Systems Cyber Emergency Response Team (i.e. the Electronic Intellectual Property Center of the MIIT) in July 2017. The report showed, in ten key fields, that great numbers of high-quality patents had been filed very proactively, and the total number of patent applications was 3,166,882, the number of invention patents was 1,813,689 with 668,448 granted. Roughly, the invention patent application accounted for 50% on average with the highest proportion in aerospace equipment; the granting rate of invention patents in ten key fields with the highest rate in new materials. In terms of geographical distribution, the number of invention patents granted by Guangdong, Beijing and Jiangsu represented the largest quantities of patents in the country.³⁹⁰⁴

15.1.6 Market Penetration of China’s Digital Platforms and their Ownership

15.1.6.1 The Concentration of Internet Access Providers and their Ownership Profiles

As mentioned above, China currently has three network operators, China Mobile Communications Group Co., Ltd. (CMCC), China Unicom and China Telecom, all of which are state-owned enterprises, subject to the supervision of the State-owned Assets Supervision and Administration Commission of the State Council (hereinafter referred to as the SASAC).

According to the financial reports released by the three operators, the three operators achieved a total revenue of 1,381.529 billion yuan in 2017, with China Mobile taking the largest share, accounting for 53.6%. Specifically, in 2017, China Mobile’s revenue was 740.5 billion yuan, China Telecom’s revenue was 366.2 billion yuan, and China Unicom was 274.829 billion yuan. From the perspective of net profit, the three operators in 2017 achieved a net profit of 134.745 billion yuan, and China Mobile alone accounted for 84.43%. In terms of the number of 4G users, in 2017, China Mobile had a total of 649.507 billion users, China Telecom had 182.04 million and China Unicom had 174.876 million, and their market shares were 64.5%, 18.1% and 17.4% respectively. In terms of fixed communication, in 2017, the number of fixed network broadband subscribers China Mobile was 112.687 million, that of China Telecom was 133.53 million, and the figure of China Unicom was 76.539 million. Their market shares were 34.9%, 41.4% and 23.7% respectively.

3904 “The Trend Report on Patents Involving Ten Key Technical Fields included in ‘Made in China 2025’ released”, http://www.sohu.com/a/156987995_752834, date of visit: January 21, 2019.

Figure 9 Market Shares of 4G Users of Three Operators in China in 2017

Figure 10 Market Shares of Fixed broadband Subscribers of Three Operators in China in 2017

15.1.6.2 The Market Concentration of Search Engine Platforms and their Ownership Profiles

At present, China's Internet search engine companies mainly include Baidu, Sogou Inc., 360 Search. The foreign search engines operating in China mainly include Google (in Hong Kong, China) and Microsoft Bing. According to the *China Internet Development Report 2018* published by the Internet Society of China,³⁹⁰⁵ the size of China's search engine market reached 77.52 billion yuan in 2017, an increase of 7.1% year-on-year. The number of search engine users reached 640 million, an increase of 6.2% compared to 2016. From the development trend of search engines, the general search is shifting to the vertical field; search is likely to be combined with hardware to become a new entry; the search forms will shift to voice and photo search; therefore, AI technology will constitute the core competitiveness of search engine companies.

The Market concentration of the Chinese search engine market is relatively obvious, and the competitive situation is basically stable. Baidu's market share is as high as 77.2%, being No. one search engine in the Chinese market. Baidu is the world's largest Chinese search engine and the largest website in Chinese. Founded in Beijing on January 1, 2000.

3905 "The Report on China Internet Development 2018 Released: Chinese netizens reaching 772 million in 2017", <https://www.cnbeta.com/articles/tech/746083.htm>, date of visit: January 30, 2019.

Baidu's Internet search products and services mainly include: functional search based on web search; community search based on post bars, vertical search for various regions and industries; and portal channel, IM, etc. The business type of Baidu Company is a limited liability company (natural person investment or holding). According to public information, it has two natural person shareholders to fund the company and take controlling interests.

Sogou Inc., ranked second in the industry, it has a market share of 6.6%. Sogou Inc. is China's leading Internet products and services provider such as Internet search, input method and browser. Since the birth of Sogou search in August 2004, it has developed into the second largest search engine in China after more than ten years. According to iResearch's data of December 2016, Sogou PC users reached 528 million. Sogou was originally a division of Sohu. In 2010, it was separated and began independent operation as a company instead of being a department of Sohu previously. Its company type is a limited liability company invested by one and single legal person (i.e. invested by Sogou Hong Kong Co., Ltd.). In 2013, Sogou obtained Tencent's strategic investment, merged with Tencent's Soso and other businesses, and became the only chaser and disruptor in the mobile search field.³⁹⁰⁶

360 Search ranks third in the Chinese search engine market and currently has a market share of 3.2%. 360 Search was launched by Qihoo 360 Technology Co. Ltd. in 2012. It belongs to the meta search engine category and helps users to select and utilize suitable engine/engines among multiple search engines through a unified user interface to implement retrieval operations. it is a global control mechanism for multiple retrieval tools distributed across the network.

Figure 11 Market Structures of 2017 China Search Engines

15.1.6.3 The Concentration of Social Networking Platforms and their Ownership Profiles

As of June 2018, the top three social applications in China were WeChat moments, QQ (Qzone) and Weibo, all of which are comprehensive social applications. Among them,

³⁹⁰⁶ See Sogou's official website: <http://corp.sogou.com/introduction.html>, date of visit: February 2, 2019.

WeChat moments and Qzone are the social services derived from Tencent's instant messaging tools WeChat and QQ. Their usage rates are 86.9% and 64.7% respectively.³⁹⁰⁷ Judging from the number monthly active users of social applications, Tencent is China's number one social platform, and its market position in China can hardly be shaken. As of December 2017, monthly active users of Tencent's Weixin and WeChat were 987 million; and especially after the Spring Festival of 2018, the officially combined monthly active accounts of the two exceeded 1 billion.³⁹⁰⁸ Meanwhile, Tencent's another QQ had 783 million monthly active accounts, of which Qzone enjoyed 632 million monthly active accounts at the end of the first quarter of 2017. Most of the users currently using QQ space are young people under the age of 24, accounting for more than 40%. Female users accounted for a high proportion of 71.47%, even more active in the Qzone.³⁹⁰⁹

As a form of social media, benefiting from the influence of celebrities, superstars and media content ecology, as well as the vigorous development of short videos and mobile live broadcasts, the usage rate of Weibo continued to rise, reaching 42.1%. According to the *42nd Statistical Report on Internet Development in China*, in the first half of 2018, the number of Weibo users in China was 337 million, accounting for 42.1% of all netizens of China.³⁹¹⁰ The monthly active users of Weibo reached 411 million, making it the seventh social product with a global active user scale of over 400 million, with mobile terminals used accounting for 93%.³⁹¹¹ Some research institutions have conducted research and analysis on the structure of Weibo users, and found that young white-collar workers were the main group of Weibo users: young people under 30 years old exceeded 80%, users aged 18-30 approached 70% and users with higher education at or above the university level were always the main users of Weibo, accounting for 77.8%.³⁹¹²

15.1.6.4 The Concentration of Internet Advertisers and their Ownership Profile

According to iResearch's *Annual Monitoring Report on China Online Advertising Market 2018*,³⁹¹³ the online advertising market in China reached 375.01 billion yuan in 2017, a year-on-year increase of 32.9%, accounting for more than 50% of the Chinese advertising market. Online advertising is still the core business model of the Internet industry. In particular, mobile advertising has become a key point for growth. In 2017, China Mo-

bile's advertising scale reached 254.96 billion, accounting for nearly 70% of the total online advertising. Among various forms of online advertising, e-commerce advertisements (including vertical search advertisements and display advertisements) accounted for 29.8%, which was basically the same as in 2016. Typical enterprises in this area are Alibaba Group, Jingdong, and Qunar. Information flow advertisements (mainly including social media, news information, and information flow advertisements in video websites) accounted for more than 14%, and maintained rapid growth, main companies are Tencent's WeChat, Byte Dance's toutiao, etc.; search advertising (including search keyword advertising and alliance advertising) had a market size of about 93.7 billion yuan, accounting for 24.9%, mainly including Baidu search engine. In the leading Internet companies, the concentration of online advertising revenue has gradually increased. Alibaba Group, Baidu, Tencent and Byte Dance altogether account for 60% of the total online advertising revenue.

Alibaba Network Technology Co., Ltd. (abbreviated as Alibaba Group) was founded in Hangzhou, Zhejiang Province by 18 people including Ma Yun. Its business and related companies mainly include: Taobao, Tmall, Juhuasuan, AliExpress, Alibaba International Exchange Market, 1688, Alimama, AliCloud, Ant Financial, and Cainiao Network. On September 19, 2014, Alibaba Group was officially listed on the New York Stock Exchange. In December 2018, Alibaba was listed among global Top 500 brands in 2018. With the popular e-commerce website platforms such as Taobao, Tmall, and Juhuasuan, Alibaba's mobile users and merchants continue to grow, and marketing technology continues to improve. It has gradually dominated the digital advertising field in China. In 2017, Alibaba Group's advertising revenue exceeded 100 billion yuan, ranking first among Internet companies.³⁹¹⁴

Baidu's advertising revenue ranks second among Internet companies. As the world's largest Chinese search engine and the largest Chinese website, Baidu is one of the top ten Internet companies in the world, including streaming media, community forums, mobile assistants and other Internet fields. In the beginning, Baidu devoted itself to the development of search engines and opened up domestic market segments and finally its market share exceeded 70%. Since 2010, Baidu has gradually deployed streaming media, online travel, take-away food websites, mobile assistants and other segments, and also created a streaming media site, iQiyi. Advertising revenue sources of Baidu have accordingly expanded from search advertising to stream advertising.

Founded in 1998, Tencent is one of the largest integrated Internet service providers in China and one of the Internet companies with the most numbers of users in China. Tencent's diversified services include social and communication services "QQ" and WeChat, social networking platform "Qzone", Tencent Games' "QQ game platform", portal website "Tencent.com", Tencent news client and online video service "Tencent Video". According to Tencent's 2017 financial report, its operating income was 237.76 billion yuan and its net profit was 72.471 billion yuan. Tencent's online advertising business

3914 Annual Monitoring Report on China Online Advertising Market 2018, <http://report.iresearch.cn/report/201808/3264.shtml>, date of visit: January 30, 2019.

revenues were 40.439 billion yuan. Among them, media advertising revenue was 14.829 billion yuan, mainly arising from Tencent Video (video streaming service); and social and other advertising revenue increased to 25.16 billion yuan, mainly driven by the growth of advertising revenue generated by WeChat, other mobile applications and alliances advertising.

Beijing Byte Dance Technology Co., Ltd. was established in 2012. Its independently developed toutiao (meaning today's headline news) client and conducted deep data mining and user behavior analysis through massive information collection to recommend personalized information to users. In this way, Byte Dance created a brand new reading mode. In 2016, it launched many products one after another such as douyin, huoshan video, and xigua video, which made the company stand out quickly in short video applications. Strongly driven by two super-flow portals of toutiao and douyin, the total length of time spent on the company's products accounted for 10.1% of the time spent on all internet products in the first half of 2018 while the percentage was 3.9% in the first half of 2017. And in this regard, Byte Dances was ranked No. two, second only to Tencent whose products took the largest share. Internet advertising has also become an important source of its income, mainly in the form of information flow advertisements, open screen advertisements and detail page advertisements. Through the estimation of the results of these three forms of income, Evergrande Research Institute roughly estimated the revenues of the aforesaid three forms and forecasted that advertising revenue generated on toutiao and douyin apps would exceed 29 billion yuan and 18 billion yuan respectively in 2018.

15.1.6.5 the Concentration of Cloud Computing Platforms and their Ownership Profiles

At present, China's cloud computing market is in a stage of rapid development. The increasingly mature technologies such as containers and micro-services is driving the transformation of cloud computing, but there is still a gap with the scale of the global market. According to the statistics of the CAICT, the overall market size of China's cloud computing in 2016 reached 51.49 billion yuan, with an overall growth rate of 35.9%. In 2017, it grew to be 69.16 billion yuan. In terms of public cloud, service providers are dominated by large Internet companies and software companies such as Alibaba, Baidu and Tencent have got involved into the fields actively. In the private cloud, large enterprises including the telecommunications, energy, power, and pharmaceutical industries have begun to introduce cloud computing into the process of their internal information technology application. In China's 2018 cloud computing enterprise rankings, the top three companies leading the cloud computing market are Alibaba (Alibaba Cloud), China Telecom (eCloud) and Tencent (Tencent Cloud), and their leading edge is still expanding. In addition, top 10 companies also include: China Unicom (Wo Cloud), Huawei (Huawei Cloud), China Mobile (Mobile Cloud), Baidu (Baidu Cloud), Huayun (China Cloud), Inspur (Inspur Cloud), H3C (H3C Cloud).³⁹¹⁵ Except China Telecom, China Unicom and China

3915 "Top 50 of the Cloud Computing Enterprise Rankings in 2018", <http://top.askci.com/news/20181022/1756231134823>.

Mobile that are state-owned enterprises, all other cloud computing companies are domestic private companies.

According to the *Report on China Public Cloud IaaS Market Share Data of the First Half of 2018* released by International Data Corporation (IDC), Alibaba Cloud Computing Co. Ltd. had the largest market share in China, taking a share of 43%, with other competitors left far behind. Alibaba Cloud was formally established in September 2009. Based on the strong technical strength of Alibaba Group, the company independently developed a large-scale computing operating system “Apsara” and became the world’s first to provide 5K cloud computing services. The company now has been among top three cloud computing companies in the world. In the first half of the 2019 fiscal year, Alibaba Cloud’s revenue reached 10.37 billion yuan and maintained rapid growth. At present, 40% of China’s top 500 companies use Alibaba Cloud; about half of Chinese listed companies use Alibaba Cloud; 80% of the innovation and startup companies born in China use Alibaba Cloud every day.³⁹¹⁶

Tencent Cloud is a cloud computing brand built by Tencent to provide customers with cloud computing, big data, artificial intelligence services, and customized industry solutions, including cloud servers, cloud storage, cloud databases and elastic web engines. Tencent Cloud analysis (MTA), Tencent cloud push (pigeon) and other overall big data capabilities; as well as QQ interconnection, Qzone, micro-cloud, micro-community and other cloud-linked social systems. Tencent Cloud has a deep infrastructure and ample experience in massive Internet services. Whether it be social, gaming or other fields, it has many years of mature products that can deliver quality services. According to the global public cloud vendor rankings for the first quarter of 2018 released by the US market research firm Synergy Research Group, Alibaba Cloud was ranked second and Tencent fifth in the Asia Pacific region.³⁹¹⁷

China Telecom Cloud Computing Branch (eCloud) is a professional company under China Telecom, which integrates marketing, operation services and product research and development, and stays committed to becoming a leading provider delivering basic cloud computing services in Asia Pacific. In 2016, Tianyi Cloud, with its self-developed cloud platform and 5s security system as well as based on its SOE status and the Internet innovation mechanism, started to provide users with secure cloud services. And eCloud provides users with cloud hosting, cloud storage, cloud backup, desktop cloud, exclusive cloud, hybrid cloud, CDN, big data etc., as well as offers customized cloud solutions for the government, medical, education, finance and other industries. It is a cloud service provider favored by both government and corporate customers. According to the *Semi-annual Report of China’s Public Cloud Service Market* released by IDC, China Tele

shtml, date of visit: February 3, 2019.

3917 “China’s Public Cloud Market Reaching 26.48 Billion yuan in 2017 and 60% of Enterprises Choosing to See Prices”, <http://news.mydrivers.com/1/591/591329.htm>, visit date: February 13, 2019.

com (eCloud) ranked third with a market share of 7.6%, becoming one of the domestic manufacturers with the fastest growing public cloud business in 2017.

When it comes to the private cloud market, as markets such as government cloud, manufacturing and financial cloud become active (the three occupy market shares of more than 60%), and local governments work vigorously to implement cloud plans, a solid foundation is being made for the development of private cloud. According to the *Research Report on China Private Cloud Market Status and Development Trend 2017-2018*, five leading brands operating in the Chinese private cloud market are Huawei, H3C, VMware, Huayun and EasyStack, of which VMware is the only foreign company.³⁹¹⁸

15.2 The Institutional Framework of China's Digital Economy

WANG Xianlin & WU Peicheng

15.2.1. China's Digital Economy Development and Its Relationship with Competition Law

15.2.1.1 China's Digital Economy Development Process

The Chinese government attaches great importance to the development of the digital economy and proposes "to accelerate the development of the digital economy, promote the integration of the real economy and the digital economy, promote the deep integration of the Internet, big data, artificial intelligence and the real economy, continue to do a good job of informatization and industrialization, accelerate digital, intelligent and Internet-based development in manufacturing."

The development of China's digital economy can be divided into the following major periods:

Budding period (1994-2002): China officially joined the Internet in 1994. A large number of pioneering companies in the Internet industry were established, such as Sina, Sohu, and NetEase. The e-commerce platforms such as Alibaba and Jingdong also entered the initial stage. Search engines like Baidu and social networking sites such as Tencent are also evolving. In this stage, Chinese start-ups generally imitated foreign successful business models.

High-speed development period (2003-2012): Internet users in China continued to maintain double-digit growth during this period. In 2003, Alibaba launched Taobao.com, a personal e-commerce website, and developed into the world's largest C2C e-commerce platform. The Alipay business launched by Alibaba has gradually become the leader of third-party payment. In 2007, China issued the *Eleventh Five-Year Plan for E-Commerce Development*, which identified e-commerce services as an important emerging industry

³⁹¹⁸ "A List of Top 20 Latest Chinese Private Cloud Enterprises 2018", <https://baijiahao.baidu.com/s?id=1616922716727374581&wfr=spider&for=pc>, date of visit: February 13, 2019.

of the country. In 2005, Tencent QQ registered users over 100 million, and netizens were more deeply involved in instant messaging. By the end of 2012, the number of mobile Internet users in China reached 420 million, and the number of Internet users using mobile phones exceeded that of those using desktop computers for the first time. The development of China's digital economy entered a new stage.

Maturity period (2013-present): At the maturity stage, the digital economy has two characteristics: First, traditional industries are connected with the Internet. For example, you can hail a car or taxi through the "DiDi Chuxing" app, and order take-out online through "ele.me", "Meituan", etc. Second, Internet-based model innovations continue to emerge, for instance the rise of shared bicycles like Mobike.

In short, China's digital economy was mainly based on IT application and encouraging policies on e-commerce development in the early stage. In 2017, the term "digital economy" first appeared in the State Council's government work report. The State Council launched the *Guiding Opinions on Actively Propelling the Internet Plus Action Plan*, which aims to promote the development of the digital economy industry and encourage enterprises to "go out". At present, China has formed a relatively clear industrial development direction and development goals.³⁹¹⁹

15.2.1.2 China's Digital Economy Development Strategy

15.2.1.2.1 China's Strategy of Information Technology and E-commerce Development

The Chinese government has always attached importance to the development of the digital economy such as the Internet. In November 2005, China formulated the *State Informatization Development Strategy (2006-2020)*, which further clarified the focus of Internet development, and proposed to adjust the economic structure and transform the economic growth mode, and promote the national economy informatization, improve governance capability, the implement e-government, build a harmonious society, and promote IT application in society. In 2005, China's e-commerce was still in its infancy, and the General Office of the State Council of China issued the *Several Opinions on Accelerating the Development of E-Commerce*. These opinions pointed out that e-commerce plays an important role in national economic and social development. The document proposed to improve the environment of policies and regulations to standardize the development of e-commerce and accelerate the development of credit, certification, standards, payment and modern logistics so as to form a system of supporting e-commerce. It is designed to give full play to the role of enterprises to advance the application of e-commerce. Additionally, it is committed to enhancing the level of e-commerce technology and services in order to promote the development of related industries and strengthen exchanges and cooperation in international competition.

³⁹¹⁹ See the website of the news of Communist Party of China <http://theory.people.com.cn/n1/2018/0816/c40531-30232681.html>, last access date February 1, 2019.

15.2.1.2.2 China's "Internet Plus" Action

Nearly ten years later, in 2015, the Chinese government proposed a programmatic document for the industrial development of the Internet sector. The State Council pointed out in the *Guiding Opinions on Actively Propelling Internet Plus Actions Plan (Guo Fa [2015] No. 40)* that "Internet Plus" is to integrate the innovation achievements of the Internet with various fields of economic and social development, promote technological progress and efficiency and organizational change, enhance the innovation and productivity of the real economy, and form a new form of economic and social development with the Internet-based infrastructure and innovation elements. The strategic document of the State Council clarified that by 2018, the development of China's Internet and its integration with economic and social fields would be further deepened, and network economy and the real economy would enjoy synergistic development; and by 2025, the "Internet Plus" industrial ecosystem of synergy featuring enhanced network capabilities, intelligence, and services will be basically formed, and "Internet Plus" will become an important driving force for economic and social innovation and development. On this basis, the State Council proposed 11 key actions: "Internet Plus" entrepreneurship and innovation, collaborative manufacturing, modern agriculture, smart energy, inclusive finance, public-benefiting services, efficient logistics, e-commerce, convenient transportation, green ecology and artificial intelligence. Afterwards, the Chinese government successively introduced policies and measures to ensure that the "Internet Plus" key actions could take root in various fields, for instance, the State Council issued the *Guiding Opinions on Accelerating the Work of 'Internet + Government Services'* in September 2016 and the *"Guiding Opinions on Deepening 'the Internet + Advanced Manufacturing Industry for the Development of the Industrial Internet'"* in November 2017; and the Ministry of Industry and Information Technology issued the *Guiding Opinions on Implementing the State Council's Plan for Actively Propelling the Internet Plus Action Plan* in 2015. All these documents adopted specific measures to facilitate the implementation of the "Internet Plus" work. Especially in the financial sector, Internet finance has gradually become an emerging field of China's economic development. In July 2015, the People's Bank of China (PBOC) and other departments jointly issued the *Guiding Opinions on Promoting the Sound Development of Internet Finance*, proposing to encourage innovation, support the steady development of Internet finance, clarify the responsibility of Internet financial supervision, and regulate the Internet financial market order, so as to further promote financial reform and innovation and open wider to the outside world.

15.2.1.2.3 China's Big Data Development Strategy

The Chinese government also attaches importance to the development of big data. In August 2015, the State Council of China issued the *Notice on Printing and Distributing the Action Plan for Promoting Big Data Development*, which officially established the national strategy for the development of big data (to become a major data country). The Notice points out that big data is a data set characterized by Volume, Variety, Velocity, and Value (4V). The data of various forms and scattered sources can be collected, stored

and analyzed on a correlation basis. Big data is evolving into a new generation of information technology and service format that can discover new knowledge, create new value, and enhance new capabilities. The notice proposes 10 big data projects: government data sharing project, the project of coordinated national data development, e-government big data project, data-enabled public service project, industrial and emerging industry big data project, modern agricultural big data project, data-driven public innovation project, project of key big data technologies and product R & D and industrialization, project of enhancing big data support for other industries, as well as network and big data security project. In order to promote the application of big data in specific industries, China has formulated the *Big Data Industry Development Plan (2016-2020)*. The *Development Plan* further points out that big data has become one of the strategic shapers of the country's competitiveness and is accelerating the transformation of the information industry.

It can be seen that the Chinese government attaches great importance to the development of the digital economy and formulated corresponding strategic documents in the fields of e-commerce, the Internet, big data, artificial intelligence and other aspects, and integrated the digital economic development into the China's overall reform and opening up. In the past 20 years, the Internet has been deeply integrated and with China's industrial development plan and people's lifestyle. The rapid development of China's Internet has benefited from China's reform and opening up policy, sustained economic development and international advanced technology and experience. The development of China's Internet has greatly promoted the development of China's science and technology, economy, politics, society and culture, as well as the progress of China's social civilization and the improvement of people's living standards. The Chinese government will continue to promote the development of the Internet and encourage the use of new technologies to provide new services to meet the growing diverse needs of people.³⁹²⁰

15.2.1.3 China's Digital Economy Strategy and its Relationship with Competition Policy

15.2.1.3.1 China's Digital Economic Policy and Competition Policy

China's digital economic policy, in a way, is also a kind of industrial development policy, and it has a close relationship with competition policy. China has established the basic position of competition policy and clearly stated that "enhance the basic position of competition policy and create an institutional environment for fair competition."³⁹²¹ Accordingly, the government has introduced a series of policies, laws and regulations concerning coordination between China's digital economy strategy and competition policy. In recent years, the central government and local governments at all levels of China have implemented a fair competition review system. In 2016, the State Council issued

³⁹²⁰ See "Announcement of China's Internet Status", the State Council Information Office announced on June 8, 2010.

³⁹²¹ See Qiushi.com, see http://www.qstheory.cn/yaowen/2018-12/21/c_1123887866.htm, last access date February 1, 2019.

the *Opinions on Establishing a Fair Competition Review System in the Construction of the Market System* and the National Development and Reform Commission and other three departments jointly issued the *Implementation Rules on the Fair Competition Review System (Provisional)*. According to the fair competition review system, the impact of policies on competition will be assessed during the policy-making process, and digital economic policies that have not been evaluated or evaluated having a serious impact on competition cannot be introduced.

15.2.1.3.2 The Role of Anti-monopoly Law Enforcement Agencies in the Digital Economy Strategy

From an empirical point of view, it is usually high-level departments that are responsible for formulating digital economic policies in China. Many digital economic development strategies are directly carried out by the CPC Central Committee and the State Council. In the policy formulation process, opinions and suggestions including those of Anti-monopoly Law enforcement agencies are usually heard. Especially given China has established the fundamental status of competition policy, the specific digital economic strategy formulation department will usually seek the opinions of Anti-monopoly Law enforcement agencies to assess the impact of industrial policies on the competitive environment. Thus, Anti-monopoly Law enforcement agencies are playing a growing role in the formulation of digital economic strategy.

In addition, according to the provisions of China's *Anti-monopoly Law*, Anti-monopoly Law enforcement agencies may propose to the relevant higher authorities to deal with administrative subjects who abuse administrative power to eliminate or restrict competition. Therefore, for digital economic strategic documents that might exclude and restrict competition during the implementation process, Anti-monopoly Law enforcement agencies may make recommendations to the policy-making organs and their higher-level organs in accordance with the provisions of the *Anti-monopoly Law*. In practice, Anti-monopoly Law enforcement agencies will also supervise and guide through issuing letters to the policy-making organs.

15.2.2. Digital Property Protection in the Perspective of Chinese Law

15.2.2.1 Intellectual Property Issues in the Digital Economy

There are intellectual property rights involved in the development of China's digital economy. They are mainly reflected as follows from the Chinese law perspective:

15.2.2.1.1 Intellectual Property and Big Data

Some people believe that big data is a new form of intellectual property. The object of intellectual property protection is information that contains human creativity and

has certain value.³⁹²² Therefore, the object of intellectual property is in fact information, that is, “intellectual information is the content, and knowledge is only the form.”³⁹²³ The electronic data as an external form of big data is the expression of information and represents the form of the object of intellectual property and it can vividly explain why big data can become the logical source of a new state of intellectual property rights.³⁹²⁴ The Chinese jurisprudence adopts the classification criteria of “native data” and “derived data” for big data. The former refers to data generated through legal collection, recording, and storage means, and the latter refers to systematic, readable data that is formed by cleaning, desensitization, anonymity, processing, calculation, polymerization, etc. through the use of algorithms for specific purposes.³⁹²⁵ It is generally accepted in the legal theory that the object of big data under the Chinese law perspective refers to “derived data”. For example, after the implementation of the *General Provisions of the Civil Law*, the official interpretation of the *General Provisions of the Civil Law* holds that Article 127 of the Rules does not involve the statistical and non-identifiable data of personal information, since collection, processing and use of the data are conducted after encryption of the original data on the basis of protecting the privacy and information rights of natural persons.³⁹²⁶ Some argue that “derived data” meets the requirements of intellectual property objects, and relevant intellectual property rights should be provided for them. And they can be called “data rights” according to the traditional naming logic of intellectual property rights, i.e., civil subjects can enjoy, based on derivative data, these dominant intangible property rights, which can specifically include rights of marking, storage, use, modification, protecting data integrity, reproduction, and earnings. At the same time, national security, public interest, and the interests of others cannot be endangered when data rights are exercised. The rights is fully characterized by the intangible and proprietary nature of traditional intellectual property.³⁹²⁷

15.2.2.1.2 Intellectual Property Issues in the Field of Artificial Intelligence

In 2017, artificial intelligence was first included in the work report of the State Council of China. The report of the 19th National Congress of the Communist Party of China proposed: “China is going to accelerate the construction of a manufacturing power, speed up the development of advanced manufacturing, and promote the in-depth integration of the Internet, big data and artificial intelligence with the real economy.” As of April 2017, Baidu had published more than 2,000 Chinese patent applications and hundreds

3922 See Zhang Yumin: *Intellectual Property Law*, Law Press, 2011, p. 12.

3923 Xu Wei: “The Legitimacy of Intellectual Property: On the Consideration and Balance in Intellectual Property Law”, in *China Social Science*, No. 4, 2003.

3924 Wang Guangzhen: “Analysis of the Legal Nature of Big Data”, in *Journal of Chongqing University of Posts and Telecommunications (Social Science Edition)*, No. 4, 2017.

3925 See Yang Lixin and Chen Xiaojang: “Derivative Data is the Object of Data Exclusive Rights”, in *Journal of Chinese Social Sciences*, July 13, 2016, 5th edition.

3926 See Shen Deyong: “General Provisions and Application of the Civil Law of the People’s Republic of China” (below), *People’s Court Press*, 2017 edition, p. 869.

3927 See Chen Junhua: “Research on Data Rights in Data Open Sharing in the Big Data Era”, in *Book & Information*, No. 4, 2018.

of foreign patent applications in artificial intelligence. The technical content involves speech recognition, image recognition, natural language understanding, user portraits, automated driving, deep learning, and cloud computing. Artificial intelligence is a science and technology on the theory, methods, techniques and application systems of simulating, extending and enhancing human intelligence. Its research fields mainly include machine learning, natural language processing, images processing and human-computer interaction. Artificial intelligence has brought certain impacts on the intellectual property system, mainly including the following aspects:

The first issue is about the subject qualification of intelligent robots. In favor of giving intelligent robots a legal personality, the artificial intelligence of the future world will appear more as a “humanoid subject”, that is, anthropomorphic objects that can express human uniqueness. Since a legal person can be drafted as a person with rational thinking, a robot artificially made by human intelligence can also become a civil subject. The opposing view is that no matter how the robot assumes responsibility, the ultimate responsibility bearer is humans, which makes the “legal personality” of artificial intelligence redundant.

The second issue is about the nature of artificial intelligence products as an intellectual property object. There is a view in the field of intellectual property law in China that there are three aspects of artificial intelligence products that are not “patentable”: first, inventions that are contrary to public order, such as “killer robots” as criminal tools should be prohibited. Second, inventions that are not technical solutions, such as rules and methods of intellectual activities, and diagnosis and treatment of diseases; third, inventions in some specific technical fields, mainly referring to some inventions with unpredictability or potential irreversibility, such as artificial intelligence techniques with “machine bias” and “black box” algorithms. In addition, there is a corresponding problem of the copyrightability of the artificial intelligence product and its ownership.

Finally, there are a lot of works to do in integrating standards of artificial intelligence. The artificial intelligence technology and related products are developing rapidly. It is still difficult to reach a consensus on the concept, connotation, application modes and intelligence level of the industry. With a weak foundation of standardization work and multiple generic technology fields of the artificial intelligence, involving different technical committees of standardization, it is imperative to strengthen the top-level design to avoid repetitive, overlapping work.³⁹²⁸

15.2.2.1.3 Other Intellectual Property Issues

The intellectual property issues in the digital economy era are complicated. In addition to new things that directly impact the intellectual property system, the difficulty of applying laws due to the characteristics of the digital economy is also worthy of attention. For example, in China, where e-commerce is booming, online shopping has become an important channel for residents’ daily consumption. The cross-regional nature of online

³⁹²⁸ See Wu Handong et al., “The Challenge of Artificial Intelligence to the Legal Protection of Intellectual Property Rights”, in Chinese Law Review, No. 2, 2018.

shopping has led to many problems in the jurisdiction of the courts in intellectual property infringement cases. China is still exploring the legal governance process related to intellectual property rights in the era of digital economy.

15.2.2.2 Propertization of Industrial Data and Algorithms

The protection of industrial data and algorithms is strongly related to intellectual property and competition law. For example, a large data set that can constitute a compilation work can be protected by copyright law; a big data computing program with distinctive technical attributes and that can solve certain technical problems can be protected by patent law; and the internal industrial data and information before being put into circulation can be protected as trade secrets under *the Law against unfair competition*. Judging from China's judicial practice, right holders are more inclined to seek the protection according to *the Law against unfair competition* in litigation cases involving industrial data. For example, in both cases of "*Sina Weibo v. Maimai*(in which the plaintiff claims the defendant uses its users' information)"³⁹²⁹ and "*Dianping.com v. Baidu* (in which the plaintiff claims the defendant is engaged in unfair competition)"³⁹³⁰ the courts referred to *the Law against Unfair Competition* to protect industrial data.

The current Chinese intellectual property law protects industrial data with certain limitations, mainly because of more stringent protection conditions of intellectual property laws such as copyright law and patent law. For example, if the industrial data is to be protected by the copyright law, the premise is that the industrial data should be a work, and the work must be original. The Berne Convention stipulates that works protected by copyright law are the result of the author's intellectual creation. Therefore, this issue is not only a problem faced by China, but by other countries as well. The special feature of industrial data is that it is difficult for the original data (unprocessed) to meet originality requirements. For example, in the "*Dianping.com v. Aibang.com*" Case³⁹³¹ ruled by the Beijing People's Court, the court held that the arrangement of netizens' comments network in time order does not possess originality and a collection of such comments does not constitute a compilation of works.

China's *Patent Law* can also protect big data computing programs with distinct technical attributes and that can solve certain technical problems. China's *Guidelines for Patent Examination* also contains invention patent regulations on computing programs: A computing programs refers to a solution that controls or processes external and internal objects of the computers to solve the invention challenges, based on the computer program process in whole or in part, by relying on the the execution of the computer program developed according to the aforesaid process. If a patent requirement only involves an algorithm or mathematical calculation rule or the computer program itself, or the rules and methods of the game, then the claim is only a rule and method of intellectual activity; consequently, it is not an object of patent protection. Usually it is hard

3929 Beijing Intellectual Property Court (2016) Beijing 73 Minzhong No. 588 Civil Judgment

3930 Shanghai Intellectual Property Court (2016) Shanghai 73 Minzhong No.242 Civil Judgment

3931 Beijing No. 1 Intermediate People's Court (2009) Yizhong Minzhong No. 5031.

for big data to obtain patentability. Therefore, in practice, enterprises often refer to trade secrets in the *Law against Unfair Competition* to protect their industrial data. For example, in the case of “*Quzhou Wanlian Network Technology Co., Ltd. v. Zhou Huimin for infringements of trade secrets*”³⁹³², the Shanghai court held that user information database registered in the website can be protected as trade secrets. However, this protection also has its drawbacks, because it encourages the malicious data hiding of enterprises and may cause monopoly risks.³⁹³³

In summary, some scholars in China believe that a new path should be taken for the protection of industrial data and algorithms, that is, the establishment of new data property rights of enterprises, to create a direct protection basis for industrial data to possess exclusive rights, and new legal protection.³⁹³⁴ In judicial practice, there are already courts that consciously and indirectly recognized the property rights of industrial data. For example, in the case of “*Sina Weibo v. Maimai*” in the above-mentioned Beijing Intellectual Property Court, some believe that the court actually identified property rights (in the sense of competition law) in industrial data. The court confirmed the following point: enterprises that have invested their efforts and resources in data collection can enjoy protection of their data under competition law and others may not capture and use the data without permission or authorization..³⁹³⁵ This shows that, given the influence of intellectual property strict legalism under the existing Chinese legal system, only when industrial data or algorithms meet rather stringent conditions can they constitute objects of copyright or patent protection. In practice, enterprises tend to refer to trade secrets or general clauses of the *Law against Unfair Competition* to be protected. Yet, there are limitations to the protection of the *Law against Unfair Competition* and now Chinese courts have begun to explore a reasonable explanation of the property interests of industrial data and algorithms in accordance with competition law.

15.2.2.3 Propertilization of Personal Data and Protection of Personal Information

In recent years, the Chinese government and the public have become more aware of the importance of the protection of personal information, and this trend is also reflected in legislation and legal theory. For example, in the “SF Express/Cainiao Battle” that took place in June 2017, Cainiao Company, a subsidiary of the e-commerce giant Alibaba, and a leading Chinese express delivery enterprise SF Express closed their interoperable data interfaces, which led to a short-term obstacle to e-commerce circulation. Although the incident ended in the administrative intervention of the State Post Bureau, the fact that the companies are mastering citizens’ personal information is worthy of our reflections.³⁹³⁶

3934 See Long Weiqiu: “Data New Property Rights Establishment and System Research”, in the *Political and Legal Forum*, No. 4, 2017.

3935 See <https://www.kwm.com/en/knowledge/insights/summary-of-all-the-disputes-related-in-data-throughout-the-year-of-2017-20180321>, last access date February 2, 2019.

3936 See Xia Jinyu: “The “Cainiao / SF Express” Case Calls for the Construction of Cross-Industry Rules,” *China Economic*

Some people believe that according to the relevant provisions of China's *Cybersecurity Law*, the relationship between network data and personal information is as follows: "data" emphasizes the form while "information" emphasizes the content.³⁹³⁷ China is currently in the process of compiling the *Civil Code*. Article 111 of the current *General Provisions of the Civil Law*, which was first formulated, states: "The personal information of natural persons is protected by law. Any organization or individual who needs to obtain personal information of others shall obtain information and ensure information security according to law. No personal information may be illegally collected, used, processed or transmitted, and personal information may not be illegally bought, sold, or disclosed." "To meet the needs of the development of the Internet and the era of big data,"³⁹³⁸ the *General Provisions of the Civil Law* stipulates in Article 127: "The laws where there are provisions for the protection of data and network virtual property shall be applicable."

Regarding the nature of personal information rights, the Chinese legal community has not reached a consensus. Most scholars believe that the so-called personal information right belongs to the right to privacy or personality.³⁹³⁹ Information in the network environment is the form of the existence of natural persons, and related information can represent natural persons. Despite this, the Chinese jurisprudence generally recognizes that personal information contains the content of property rights. For example, some scholars regard personal information as the object of new personality rights from the perspectives of personality rights and property rights.³⁹⁴⁰ Personal information property rights are a new type of property right that the subject controls the commercial value of its personal information.³⁹⁴¹ Therefore, China's *General Provisions of the Civil Law* has been in a state of ambiguity on whether to directly stipulate the right to personal information. Legislators only define personal information as an interest in personality, and although they mention the protection of personal information in the section of "civil rights", they fail to clearly define the content and nature of personal information rights.³⁹⁴² Despite this, the property value of citizens' personal information is already a factual state. Just as Professor Wang Zejian, a well-known law scholar in Taiwan, China, pointed out that some personality rights have entered the market and there is a large amount of commercialization, and thus certain economic benefits have been attached to the rights. In this case, the right of personality shares the nature of property rights

Times, June 5, 2017, 6th Edition.

3937 China's "Information Security Technology – Personal Information Protection Guidelines" (GB/Z 28828-2012) 3.2 stipulates: "Personal information, related to a specific natural person, refers to computer edata that can be processed by the information system and can be used independently or together with other information to identify that specific natural person."

3938 Li Jianguo: "Notes on the General Provision of the Civil Law of the People's Republic of China (Draft) – at the Fifth Session of the Twelfth National People's Congress on March 8, 2017, in the People's Daily, March 9, 2017 Day, 5th edition.

3939 See Tan Jianchu, Li Zhenghui: "On the Right to Privacy in the Internet: focusing on a Case", in Hebei Law, No. 2, 2001.

3940 See Qi Aimin: Information in the Perspective of Private Law, Chongqing University Press, 2012, pp. 1-5.

3941 See Liu Deliang, "Protection of Property Rights of Personal Information", in Law Research, No. 3, 2007.

3942 See Ren Danli: "The Rights' Structure on Personal Information from the Perspective of the "Cainiao/SF Express Case", in Politics and Law, No. 6 of 2018.

and the assignment and authorization of specific personal interests are involved...”³⁹⁴³ From the perspective of legislation, the “National People’s Congress Standing Committee’s Decision on Strengthening Network Information Protection” states: “No organization or individual may steal or otherwise obtain citizen’s personal electronic information, sell or illegally provide to others citizens’ personal electronic information.” This is sufficient to illustrate the value attribute of citizens’ personal information.

In China’s legislation, the legal attributes of big data itself are not clear. Some scholars believe that the data in the era of big data should be assets. The roadmap of big data assets shows that data is defined, desensitized, described, accumulated, and then kept in the recording medium of the controlling person, and finally converted into a transaction target with exchange value.³⁹⁴⁴ The academic community’s identification of the nature of virtual property such as data as the objects, intellectual creation, debt, etc.. Some scholars believe that big data involving citizens’ personal information has strong personality attributes.³⁹⁴⁵ Other scholars argue that big data is the network information retained by non-specific online population, so its personality attributes become weaker, and its attributes as compilation works get stronger.³⁹⁴⁶ As mentioned above, some argued that big data is the object of information property law protection. It is precisely because a consensus has not been reached on the legal nature of big data in China, there is disagreement as to what laws or regulations apply to issues including the distribution of data rights. Chinese courts have made certain attempts on this issue. For example, in *Taobao v. Meijing* concerning the unfair competition over big data products, so called the first case involving big data rights confirmation in China, the Hangzhou Internet Court, based on *the Law against Unfair Competition*, created some new developments, i.e., it took a step forward in recognizing the new property rights of the data product subject. The court created a definition of “competitive property rights” for the data products involved, which was unprecedented. In providing legal basis, the Court not only offered the general argument from the perspective of opposing unfair competition, but emphasized the defendant occupied and profited from others’ fruits of labor, constituting the “reaping without sowing”, since the plaintiff had invested human, material and financial resources to form the data products after long-term business operation. If the defendant’s behavior was not stopped, the creative enthusiasm of big data product developers would be hindered and the development of the big data industry would be affected.³⁹⁴⁷ The case is still in the appeal process.

In summary, in the Chinese law perspective, consensus has not reached on the theory of big data and citizen personal information protection, which is also the inevitable result of the theorization of emerging fields. In general, there are general provisions in the civil law on the protection of citizens' personal information, and there will be more detailed provisions in the section of personality rights under civil law in the future. For big data protection, because of its more ambiguous legal nature, the judicial practice community tends to apply *The Law against Unfair Competition* to provide ultimate protection when no protection can be sought elsewhere so as to avoid theoretical differences on its nature. Given this situation, there has been a gradual emergence of judicial authorities to explore the possible paths of property rights protection for data.

15.2.2.4 The Regulatory System Involving Digital Property

As mentioned above, no consensus has been reached on the legal nature of digital assets in China such as industrial data, personal information, and artificial intelligence products. Despite this, digital property, as well as other property, belong to privately owned property and they are equally protected in China. Digital property rights holders may protect their property rights and interests in accordance with the provisions of the *Property Law*, the *Intellectual Property Law*, the *Law against Unfair Competition*, the *Tort Liability Law*, etc. depending on the nature of their different properties. The Chinese government protects private property rights in accordance with law, but does not directly regulate private property including digital property. Only when conducts harming public or national interests occur, for instance, abusing digital property or infringing on consumer interests and personal information, the relevant Chinese authorities will intervene as necessary. The details will be described in the following sections.

15.2.3. Digital Economy Management System in the Perspective of Chinese Law

15.2.3.1 The Regulatory System of the Telecommunications Industry

As early as in 1993, the State Council of China issued the *Examination of the State Council of the Notice of the Ministry of Posts and Telecommunications on Strengthening the Management of the Telecommunications Business* to beef up supervision of the telecommunications industry. The State Council enacted the *Regulations on Telecommunications of the People's Republic of China* in 2000, revised most recently in 2016, which established the basic regulatory system and industry norms for the telecommunications industry in China. According to the Regulations, telecommunications under Chinese law refers to the use of wired or wireless electromagnetic systems or optoelectronic systems to transmit or receive voice, text, data, images and any other form of information. China's telecommunications business investment has also gradually opened up from the total ban on foreign investment to allow foreign investment operations. The State Council also formulated the *Regulations on the Administration of Foreign-invested Telecommunica-*

tions Enterprises to specify the implementation methods of foreign-invested telecommunications enterprises.

15.2.3.1.1 Telecommunications Regulation Authority

According to Article 3 of the *Regulations on Telecommunications*, “The competent department of the State Council for Information Industry shall supervise and manage the national telecommunications industry in accordance with the provisions of these Regulations. The telecommunications regulatory agencies of the provinces, autonomous regions and municipalities shall, under the leadership of the competent department of the information industry of the State Council, supervise and regulate the telecommunications industry within their administrative region.”

China has established the Ministry of Industry and Information Technology at the central level as the regulatory authority for the national telecommunications industry. According to the *Notice of the Central Government on the Responsibilities and Institutional Adjustments of the Ministry of Industry and Information Technology*, the Ministry is committed to the following duties: facilitating the construction of a major network power and promote the broadband development; managing the Internet industry (including the mobile Internet); coordinating the integrated development of the telecommunications, the Internet and the dedicated communication network to promote the sharing of network resources; organizing safety evaluation of new technology and emerging business, strengthening access management of the communication industry, drafting relevant policies and organize their implementation; and guiding the self-discipline of related industries such as telecommunications and Internet-related industries and the development of relevant industrial organizations. The MIIT also takes up the following responsibilities: building networks and information security systems in the field of communications; formulating networks and information security plans, policies and standards for telecommunication networks, Internet and industrial control systems, and organizing their implementation and strengthening the security review of telecommunication networks, the Internet and industrial control systems; developing security management policies, norms and standards for telecommunication networks and Internet data, and organizing their implementation; as well as ensuring network security and emergency management and disposal.

The Ministry of Industry and Information Technology established the Information and Communication Administration. Its main functions are as follows: supervising information and communication services such as telecommunications and the Internet, and regulating the whole Internet industry; formulating policies and standards on market access and regulation and organizing their implementation; promoting the integration of the telecommunications, broadcasting and computer networks; overseeing market order, equipment access, service quality, user rights and personal information protection; guiding industrial self-discipline and the development of industrial organizations in the telecommunications and Internet-related sectors; conducting basic management and international coordination of communication network code number, Internet do-

main name and IP address, website filing and access service; managing the mobile internet and intelligent terminals; developing policies of data collection, transmission, storage and use to standardize information communication service market; formulating policies of network architecture and operation management and interconnection and settlement and supervision their implementation; managing the work of the National Communications Exit and Exit Bureau; as well as undertaking the construction and management of the communications emergency system, coordinating national emergency communications and important communications guarantees and undertaking the mobilization of defense communications information and combat readiness.³⁹⁴⁸

In 2018, the *Plan of the Central Committee of the Communist Party of China for the Reform of the Party and State Institutions* further clarified the duties of the Ministry of Industry and Information Technology by stating “the MIIT is responsible for coordinating the construction of telecommunications networks, the Internet, and dedicated communication networks; organizing and guiding technological innovation and progress in the communications industry as well as guaranteeing the infrastructure construction and technological innovation of the National Computer Network and Information Security Management Center.” All provincial-level units in China have established their Communications Administration as the regulatory body for local telecommunications.

15.2.3.1.2 Telecommunications Licensing System

According to the *Regulations on the Telecommunications*, the licensing system is implemented in the operation of telecommunications business in China. An entity must obtain a telecommunications business license issued by the competent department of the information industry under the State Council or the telecommunications regulatory agencies of the provinces, autonomous regions, and municipalities concerned to engage in the business operation. Otherwise, no organization or individual may carry out telecommunications business in the country. China’s telecommunications business is divided into basic telecommunication services and value-added telecommunication services. Basic telecommunication services refer to services that provide public network infrastructure, public data transmission and basic voice communication services. Value-added telecommunications services refer to telecommunications and information services provided by public network infrastructure. The following is the specific information:

Basic telecommunications services:

- (I) fixed domestic long-distance and local telephone services;
- (ii) mobile Internet telephony and data services;
- (iii) satellite communications and satellite mobile communications services;

³⁹⁴⁸ See the Notice of the Central Government on the Responsibilities and Institutional Adjustments of the Ministry of Industry and Information Technology <http://news.163.com/16/0310/12/BHQ2BF7N00014SEH.html>, last access date February 2, 2019.

- (iv) the Internet and other public data transmission services;
- (v) lease and sale of bandwidth, wavelength, optical fiber, optical cable, pipeline and other network elements;
- (vi) network loading, access and network outsourcing services;
- (vii) International communications infrastructure and international telecommunications services;
- (viii) radio paging service;
- (ix) resale of basic telecommunications services.

The business of items (viii) and (ix) is based on the management of value-added telecommunications services.

Value-added telecommunications services:

- (i) E-mail;
- (ii) voicemail;
- (iii) online information bank storage and retrieval;
- (iv) electronic data interchanges
- (v) online data processing and transaction processing;
- (vi) value-added fax;
- (vii) the Internet access services;
- (viii) the Internet information services;
- (ix) video conference call service.

15.2.3.1.3 Internet Regulation

In addition, the Chinese government has separately established the State Internet Information Office to supervise the Internet industry. The *Notice of the State Council on Authorizing the State Internet Information Office to Manage Internet Information* clearly states that the State Council's newly established State Internet Information Office which is responsible for the management of Internet information throughout the country and supervising and managing the law enforcement in this field. The State Internet Information Office has successively issued a series of regulations and management documents to promote the sound development of China's Internet industry, which include: *Management Regulations on Internet Posting Review Services, Management Regulations on Internet Forum Community Services, Management Regulations on Internet Group Information Services, Management Regulations on Internet News-based Information Services, License Management Implementation Rules on Internet News-based Information Services, Manage-*

ment Measures on Internet Information Services, Management Regulations on Internet User Public Account Information Service and Management Regulations on Block Chain Information Services. In 2016, the Chinese government enacted the *Cybersecurity Law* to ensure Internet security. According to the law, the national Internet regulator is responsible for coordinating network security work and related supervision. The competent telecommunications authority of the State Council, the public security department and other relevant organs shall be responsible for network security protection, supervision and management within the remits of their respective duties in accordance with the provisions of this Law, other relevant laws and administrative regulations.

At present, China is considering enacting the *Telecommunications Law* with a higher legal rank. According to relevant reports, the *Telecommunications Law* has been included in the legislative plan of the 13th National People's Congress Standing Committee.³⁹⁴⁹

15.2.3.2 Industry Regulation of Big Data

China has not established an independent big data management department at the level of the Central Government. The development of relevant big data industries is coordinated by the Ministry of Industry and Information Technology. For example, in 2016, the Ministry of Industry and Information Technology issued the *Big Data Industry Development Plan (2016-2020)* (the MIIT [2016] No. 412) to ensure the smooth development of the Chinese data industry.

Nevertheless, in the process of China's institutional reform in 2018, Chinese local governments have successively set up dedicated big data management departments to facilitate the application and development of big data. According to incomplete statistics, 12 provinces of Guangdong Province, Zhejiang Province, Shandong Province, Guizhou Province, Fujian Province, Guangxi Zhuang Autonomous Region, Jilin Province, Henan Province, Jiangxi Province, Inner Mongolia Autonomous Region, Chongqing Municipality and Shanghai Municipality have set up their provincial-level big data management department. The names of big data management departments in different regions are not consistent. For example, it is called "Big Data Development Administration" in Guizhou Province, "Big Data Administration" in Fujian Province, "Big Data Bureau" in Shandong Province, "Government Service and Digital Construction Administration" in Jilin Province, "Big Data Center" in Shanghai, and "Big Data Application and Development Administration" in Chongqing.³⁹⁵⁰ The local governments of China are currently implementing the "go there one time at most and get your business handled (indicating government service efficiency to be greatly enhanced)" reform. Take Zhejiang Province for example, Zhejiang is committed to creating an upgraded version of the "go to a functionary once at most and get your business handled" reform. Shifting from the "get your business handled at one functional window and enjoy integrated services" pilot program, to "one-

3949 See an Expert Seminar on the Telecommunications Law Legislation Organized by the Policy and Regulations Division, see <http://www.miit.gov.cn/n1146285/n1146352/n3054355/n3057254/n3057260/c6617041/content.html>, last visit date: 2019 February 2nd.

3950 See <http://www.echinagov.com/news/244106.htm>, last visit date: February 2, 2019.

stop service”, and then to “get your business handled with just one card” and “get your business handled at just one website”, Zhejiang has formed a strong momentum of the reform. Zhejiang improves the “Internet + government service” level, and thoroughly promotes the full-process government service online. It is the first province to build “digital government”, “online government” and “handheld government”, and ensure citizens just have to “go to a nearby functionary once” or even “just log on a dedicated website” to get more types of business handled.³⁹⁵¹ For local governments, once the data can be fully interconnected, 99% of all public services currently provided by the government can be processed online. “Go to a functionary once at most and get your business handled” will be evolved into “go to a functionary once in a lifetime”, and even “never need go to a functionary” for some services. In this sense, not only will smart government services will be delivered, they will also save plenty of manpower and resources.³⁹⁵²

In addition, China has begun to have separate local legislation on the development of big data. For example, in 2018, Tianjin introduced the *Tianjin Regulations on the Promotion of Big Data Development and Application*. In view of the urgent needs and development and application of big data in Tianjin, the Regulations adhere to a principle of holistic planning, innovation-driving, law-based governance, development promotion, win-win opening, in-depth application, prosperous business, and security assurance, and give play to the role of big data in commercial, civil, and political fields, in a bid to build a new pattern of big data development and application and accelerate the cultivation of a data-driven intelligent economic form featuring human-machine synergy, cross-border integration, and collaborative sharing.³⁹⁵³ It can be expected that along with the exploration of big data regulations of local governments in China, a big data law and a dedicated big data management department at the central government level may be created in the future.

15.2.3.3 Consumer Protection in the Field of the Digital Economy

15.2.3.3.1 Protection of Digital Economy Consumers in the Law on Protection of the Rights and Interests of Consumers

In 2013, China amended the *Law on Protection of the Rights and Interests of Consumers* for the first time in 20 years. The digital economy in consumer protection is mainly reflected in online shopping. In the past 20 years, with the rise and development of the Internet, online sales and shopping have developed into an important trading mode. According to reports, the amount of online sales transactions was 26.3 billion yuan in 2006, reaching 1.3 trillion yuan in 2012 and an increase of 49 times in six years. On the other hand, the data released by the China Consumers Association showed that in 2012, consumer associations at various levels across the country accepted 20,454 online shopping com-

3951 Zhe Xuan: “Promoting the “running for the last time” Reform, in the People’s Daily July 9, 2018, 7th edition.

3952 See http://www.sohu.com/a/272647825_329538, last visit date: February 2, 2019.

3953 See http://www.gzdsj.gov.cn/xwzx/gnpd/201812/t20181219_3372603.html, last visit date: February 2, 2019.

plaints, accounting for 52.4% of all sales service complaints.³⁹⁵⁴

In 2013, the *Law on Protection of the Rights and Interests of Consumers* was amended to include consumer protection under remote shopping conditions such as the Internet shopping. Article 28 stipulates: “Operators who provide goods or services by means of the Internet, television, telephone, e-mail etc. and operators who provide financial services such as securities, insurance and banking shall provide consumers with the business address, contact information, quantity and quality of goods or services, prices or fees, terms and conditions of performance, safety precautions and risk warnings, after-sales service, civil liability and other information.” This article guarantees online consumers’ right to know. Article 29 stipulates: “The personal information of the consumers collected by the operators and their staff must be strictly kept confidential and must not be disclosed, sold or illegally provided to others. The operators shall take technical measures and other necessary measures to ensure information security and prevent personal information from being leaked or lost. In the event of information leakage or loss, remedial measures should be taken immediately.” This article protects the personal information rights of consumers in the process of consumption. Article 25 stipulates the operator who sells goods by means of the Internet, television, telephone, mail, etc. In principle, the consumer has the right to return the goods within seven days from the date of receipt of the goods. This article is called the “repentance right” of online consumers by Chinese legal scholars, which balances the interests of consumers and network operators.

15.2.3.3.2 The Protection of Digital Economy Consumers in the E-Commerce Law

On August 31, 2018, China officially issued a specialized *E-commerce Law*, which was implemented on January 1, 2019, and involves plenty of consumer rights protection. Some commentators believe that the newly-developed “E-Commerce Law” contains several highlights in consumer protection: (1) online live sales of goods and provision of services are covered by the Law; (2) prohibition of fictitious transactions and fabrication of comments and the platform may not delete comments; (3) search results with non-personal feature options that can avoid a big data trap; (4) tied-in sales shall be prominently reminded, with “default check” prohibited; (5) the refunding method and procedures the deposit shall be expressly indicated without unreasonable conditions; (6) the platform operators, if they operate and take liability on their own, shall disclose this nature clearly according to the law; (7) the platform operators shall be held liable according to the law if they fail to fulfill their obligations; (8) increase the burden of proof of the operators and protect consumers’ rights in accordance with the law.³⁹⁵⁵

China is currently engaged in consumer rights protection law enforcement through the market regulation departments. The State Administration for Market Regulation is a na-

3954 See China National People’s Congress website http://www.npc.gov.cn/npc/xinwen/lfgz/2013-10/28/content_1811772.htm, last visit date: February 2, 2019.

3955 See the China Consumers Association website <http://www.cca.org.cn/zxsd/detail/28218.html>, last visit date February 2, 2019.

tional consumer supervision department that provides guidance and assistance to the rights protection of all consumers including those consuming in the digital economy. In 2016, the State Council also established an inter-ministerial meeting on protection of consumer rights. In addition, all consumers, including Internet consumers, can file lawsuits and defend their rights in the people's courts. According to China's *Civil Procedure Law* and the judicial interpretation of the Supreme People's Court, China Consumers Association and the provincial consumer associations can also file consumer civil public interest lawsuits.

15.2.3.4 Regulatory Protection of Personal Information

In addition to the supervision of the implementation of the law by the Standing Committee of the National People's Congress, the institutions that supervise personal information protection in China mainly include the Central Network Information Office, the Ministry of Industry and Information Technology, etc. The Central Network Information Office coordinated the network security work and related supervision according to the *Cybersecurity Law*; the Ministry of Industry and Information Technology and the provincial telecommunications management agencies carried out the protection of users' personal information according to the *Regulations on the Protection of Personal Information of Telecommunications and Internet Users*. In addition, the SAMR will supervise and protect consumer personal information in accordance with the provisions of the *Law on Protection of the Rights and Interests of Consumers* and the *E-Commerce Law*. National Information Security Standardization Technical Committee (TC260), China Communications Standards Association (CCSA) and other standards organizations are actively setting personal information protection standards. The TC260 organized and formulated a number of nationally recommended standards such as the *Guidelines on Personal Information Protection of Public and Commercial Service Information System concerning Information Security Technology* and *Specifications on Personal Information Security concerning Information Security Technology*. CCSA, in order to ensure the effective protection of personal information protection for telecommunications and Internet users, relied on TC543 and TC485 to set national and industry standards covering personal information protection of telecommunications and Internet service users, personal information protection of intelligent terminals and information security big data.³⁹⁵⁶

In general, China's regulation of personal information is carried out by industry and field. There is no separate personal information supervision department. The existing personal information protection problems occur mostly in online consumers, social networking and cybersecurity environment.

3956 See CAICT: White Paper on Personal Information Protection for Telecommunications and Internet Users (2018)

15.2.4. Regulatory Authorities and their Structures in the Field of China's Digital Economy

15.2.4.1 Functional Departments of China's Digital Economy Regulation

According to the political system established by the Chinese Constitution, the National People's Congress and its Standing Committee are the highest organ of state power, enjoying the legislative power of the state. They can supervise the implementation of the law and naturally are responsible for supervising the implementation of laws involving the digital economy. The State Council, as the Central Government of China, enjoys the highest administrative power and formulates strategic guidelines and administrative regulations concerning the digital economy in accordance with the law. The Supreme People's Court is the highest judicial organ in China. It formulates judicial interpretations with universal applicable validity in accordance with the law, issues guidance cases in order to guide the trial practice of courts nationwide, and harmonizes standards of adjudication for digital economic cases. Other departments are specifically responsible for the supervision and implementation of the digital economy.

The government functions of China involved in the regulation of the digital economy are as follows:

The Ministry of Industry and Information Technology: It is the national competent authority for information, telecommunications, artificial intelligence, and big data development.

The State Internet Information Office: It performs regulatory functions on the Internet content in accordance with the authorization of the State Council.

The State Administration for Market Regulation: It supervises of consumer protection, unfair competition and monopoly cases involving the digital economy.

China Consumers Association: Under the guidance of the SAMR, it assists consumers, including e-commerce consumers, in defending their rights.

15.2.4.2 The Role of Competition Law Enforcement Agencies in the Development of the Digital Economy

Since China's *Anti-monopoly Law* has been implemented for 10 years, China's Anti-monopoly Law enforcement agencies have handled a number of cases of typical significance. Along with the implementation of *Anti-monopoly Law*, China's digital economy has also thrived. Judging from the law enforcement cases published by China's Anti-monopoly Law enforcement agencies, there is currently less direct enforcement towards the Internet, AI, and e-commerce companies. This is mainly because the behaviors of such enterprises belong to emerging market behaviors. The extent of harm to market competition is still uncertain. Despite this, the current Anti-monopoly Law enforcement agencies

still dealt with several cases, mainly focusing on telecommunications companies, such as the monopoly case of China Unicom Inner Mongolia, the monopoly case of China Mobile Inner Mongolia and the monopoly case of the Ningxia Telecom industry handled by the industrial and commercial departments; as well as the monopoly case of Jihua Group Information Network Technology Company, the monopoly case of Changchun Telecom Enterprise, and the monopoly case of Liaoning Telecom Enterprise handled by the NDRC or the pricing regulation departments. Some people believe that in the process of establishing and maintaining a competition mechanism in a transitional country like China, the public tend to hold somewhat too high expectation towards the role of Anti-monopoly Laws and to some extent they are going too far and unrealistic. For big data-related business practices, we must adopt a modest and prudent approach in law enforcement, and avoid a belief that anti-monopoly regulations are omnipotent.³⁹⁵⁷

It is particularly noteworthy that in the *“Provisions on the Prohibition of Abuse of Market Dominant Status (Draft for Comment)”* recently promulgated by the SAMR, the SAMR has for the first time incorporated data monopoly into the field of Anti-monopoly Law enforcement. For the first time in the draft, the market dominance status of new economic operators including the Internet operators were stipulated, which stipulates that in addition to the consideration of the market shares occupied by operators, the competition characteristics, business models, network effects, technical characteristics, market innovation, mastery of relevant data and the influence of operators in the relevant market should be considered as well.³⁹⁵⁸ This indicates it is likely to conduct law enforcement against data monopoly in the future Anti-monopoly Law enforcement practice.

15.2.4.3 The Role of the People’s Courts in the Development of the Digital Economy

Chinese courts attach great importance to their own information application. In 2016, the development of the “Smart Courts” was included in the *Outline of the National Informatization Development Strategy* and the *13th Five-Year National Informatization Plan*, and it has elevated to the national strategic level. The Supreme People’s Court issued the *Opinions on Accelerating the Construction of Smart Courts* in April 2017, aiming at implementing the innovation-driven development strategy, putting in place the *Outline of the National Informatization Development Strategy* and the *13th Five-Year National Informatization Plan*, and completing of the tasks proposed in the *Five-Year Development Plan for the Informatization of the People’s Courts (2016-2020)*, so as to further modernize the trial system and capability through increased IT application. The *Opinions* pointed out that the construction of smart courts is to build a networked, transparent, and intelligent people’s court information system, to support online business processing, and make sure the full-process trial and execution are open to the public and provide a full range of intelligent services to judges, litigation participants, the public and the government departments to enable information technology to effectively serve trials and executions.

3957 See Zhan Fujing, Wang Xianlin: A Preliminary Study of Big Data Issues from the Perspective of Anti-monopoly, in *Price Theory and Practice*, No. 9 of 2018

3958 See Southern Metropolis Daily http://epaper.oeeee.com/epaper/A/html/2019-02/01/content_3815.htm, last visit date February 5, 2019.

It is also aimed to bring justice closer to the people, and to continuously improve the science-based management of people's courts at all levels with advanced information technology.³⁹⁵⁹

By the end of 2017, as for trial and execution data of Chinese courts, data of 122 million cases, more than 8 million electronic files and over 6 million electronic dossiers of nationwide courts were collected. In terms of judicial personnel data, more than 240,000 items of data concerning judicial personnel of nationwide courts were gathered. For external data, the collaborative application of external data of national citizens, road traffic accidents, organization code, lawyers, fishing boats, etc. was realized. In the area of information application and management, the data, including information system catalogs, cold standby data and informatization construction standards, were gathered and integrated. And with the "legal eyes" platform, the data involving infrastructure status, audio-visual resources and application quality and efficiency were collected as well. Fifty items of informatization standards centering on data were prepared and published. At present, the world's largest judicial information resource database has been built.³⁹⁶⁰ The specific data also showed that as by March 2018, the national courts, through IT application, reduced 1.44 billion travels for the public and police officers, an equivalent of about 19.4 billion kilometers, 16.1 billion yuan of cost reduction as well as 990,000 tons of standard coal and 2.03 million tons of carbon emissions saved. In addition, we promoted paperless office through electronic signatures and seals, online documentary circulation and other applications. In 2017, we saved about 549 tons of paper, equivalent to protecting 9328 trees. We also saved about 3 billion hours of work for the public and police officers through various types of IT applications, equivalent to 1.49 million people working for a whole year in the traditional way.³⁹⁶¹

China has also established independent Internet courts to hear judicial cases concerning the Internet. There are now three Internet courts: one in Beijing, one in Hangzhou and one in Guangzhou. According to *the Supreme People's Court's Provisions on Several Issues Case Trial of Internet Courts*, the above three Internet courts will accept Various types of cases, such as e-commerce platforms and the Internet, to further safeguard the operation of the digital economy.

In addition, Chinese courts, especially the Supreme People's Court, have established many rules in the development of the digital economy by issuing judicial interpretations and handling cases. For example, in the globally influential case of *Qihoo v. Tencent* for the alleged latter's abuse of market dominant position, the Supreme People's Court in the final instance further explained the applicable method in identifying the market dominant position of an Internet company, which has produced a far-reaching influence on theory and practice of Anti-monopoly Law.

15.2.5. The Relationship between Competition Law Enforcement and Industry Regulation in the Field of the Digital Economy

15.2.5.1 Interaction between Competition Law Enforcement Agencies and Industry Regulatory Authorities

According to the provisions of China's *Anti-monopoly Law*, Anti-monopoly Law enforcement agencies enjoy relatively independent law enforcement powers in the whole industry. In principle, industry regulatory authorities do not have the power to participate in Anti-monopoly Law enforcement. The interaction between China's Anti-monopoly Law enforcement agencies and industry regulatory agencies is mainly reflected in the following two aspects:

15.2.5.1.1 Joint Enforcement Mechanism of Anti-monopoly Law Enforcement Agencies and Industry Regulatory Authorities

For example, in December 2018, according to media reports, there was a broadband monopoly in a Beijing-based office building and small companies were forced to move out. The Ministry of Industry and Information Technology requires the Beijing Communications Administration to investigate and deal with relevant enterprises that have violated laws and regulations. The Beijing Communications Administration immediately launched an operation to investigate the situation and participated in a joint law enforcement probe led by the Beijing Bureau for Market Regulation.³⁹⁶² It can be seen that for Anti-monopoly Law enforcement in specific industries, competition law enforcement agencies can cooperate with industry authorities to ensure the healthy operation of the market. This actually involves how China deals with the relationship between competition policy and industrial policy.

Chinese scholars believe that the relationship between competition policy and industrial policy varies in different industries and different development stages of the same industry. In different countries, because of different stages of economic development, different levels of legalization of competition policies and industrial policies, the relationship between Anti-monopoly Law and the industrial regulatory legal system also varies. In China, Anti-monopoly Law enforcement agencies have the statutory authority to maintain market competition, so has the government industrial regulation department. When the Anti-monopoly Law enforcement agency conducts law enforcement on suspected monopolistic conduct, the government's industrial regulation department shall cooperate with each other and maintain certain modesty and restraint when necessary. Similarly, when the government's industrial regulation department can effectively adopt industrial regulatory measures on suspected monopolistic behavior, the enforcement of Anti-monopoly Law enforcement agencies also needs to maintain the necessary

3962 See People's Daily Online <http://tc.people.com.cn/n1/2018/1205/c183008-30443955.html>, last visit date February 5, 2019.

modesty and restraint.³⁹⁶³ In addition, the State Council's Anti-monopoly Committee, as the statutory deliberation and coordination agency concerning anti-monopoly matters, must "leverage its function and improve the administrative coordination mechanism to strike a balance between Anti-monopoly Law enforcement agencies and industrial regulatory agencies."³⁹⁶⁴

15.2.5.1.2 Implementation of the Fair Competition Review System

The fair competition review is a unique institutional measure in China. The review is to decide whether economic policies especially industrial policies have restricted or excluded competition.³⁹⁶⁵ The State Council's *Opinions on Establishing a Fair Competition Review System in the Construction of the Market System (Guo Fa [2016] No. 34)* pointed out: "The establishment of a fair competition review system is to prevent excessive and improper government intervention in the market. It is conducive to ensure that resources are allocated based on the market rules, prices and competition to maximize benefits and efficiency. According to the provisions of these *Opinions*, the implementation body of fair competition review is the policy-making departments and its legal institutions. The policy documents of Chinese governments at all levels have to experience this review before they are introduced. If they are not reviewed or fail to pass the review or are believed by reviewers that they will produce the effect of eliminating competition, such documents will not be developed. Although the body of fair competition review is the policy-making departments, since they usually lack competition-related knowledge, they tend to seek advice and suggestions from Anti-monopoly Law enforcement agencies. The Chinese academic community is advocating the legalization of the fair competition review system and incorporating it into the framework of the *Anti-monopoly Law*."

15.2.5.2 Relationship between Competition Law Enforcement Agencies and Consumer Protection Agencies

Overall, China's Anti-monopoly Law enforcement agencies and consumer protection agencies are unified and consistent, namely the SAMR at the central level and market regulations at various lower levels. According to the *Regulations on the Function Configuration, Internal Organizations and Staffing of the State Administration for Market Regulation* released in 2018, the SAMR set up the Anti-monopoly Bureau. The Bureau formulates anti-monopoly system measures and guidelines, organizes the implementation of Anti-monopoly Law enforcement work, and guides enterprises abroad to respond to anti-monopoly cases. It also guides the fair competition review; undertakes the international cooperation and exchange in Anti-monopoly Law enforcement; and undertakes the dai-

3963 See Meng Yanbei: "The Relationship between China's Anti-monopoly Law Enforcement Agencies and Government Industry Regulation Departments", in *Journal of Renmin University of China*, No. 2, 2015.

3964 See Wang Xianlin: "Two Key Words of the Industrial Policy: Law and Competition", in *Exploration and Contention*, No. 1, 2017.

3965 See Wang Xianlin: "Analysis of Competition Policy and Anti-Monopoly Strategy", in *China Market Supervision Research*, No. 1, 2016.

ly work of the State Council Anti-monopoly Committee. The SAMR is also responsible for guiding the China Consumers Association to protect consumer rights.

In addition, China's competition law itself has factors that protect consumer rights. The *Law against Unfair Competition*, amended in 2017, clarifies the protection of consumer rights as the legislative purpose in Article 1. It stipulates: "This Law is enacted to promote the healthy development of the socialist market economy, encourage and protect fair competition, prevent unfair competition and protect the legitimate rights and interests of operators and consumers." In the context of Chinese Law, damages to consumers' rights may constitute unfair competition. When it comes to identifying specific unfair competition behaviors, it is more important to consider the influence of factors regarding consumers. For example, when determining false publicity behaviors, the standard of general consumers should be adopted.³⁹⁶⁶ Similarly, China's *Anti-monopoly Law* also regards consumer interests as the legislative purpose. Article 1 of the *Anti-monopoly Law* stipulates: "This Law is enacted for the purpose of preventing and restraining monopolistic conducts, protecting fair market competition, enhancing economic efficiency, safeguarding the interests of consumers and the interests of the society as a whole, and promoting the healthy development of socialist market economy." China's "Anti-monopoly Law" also has to consider the impact of consumers' interests in specific systems such as the application of the exceptional provisions of the monopoly agreement, factors for consideration in examination of the concentration of undertakings, and the exemption of natural monopoly. Therefore, to a certain extent, China's competition law enforcement agencies also bear a function of consumer protection.

15.2.5.3 The Relationship between Competition Law Enforcement Agencies and Specialized Intellectual Property Agency

China's specialized intellectual property agency is the China National Intellectual Property Administration (CNIPA), which was directly under the State Council by 2018 and has relative independence from the Anti-monopoly Law enforcement agencies. After the reform of China's state authorities in 2018, the re-established CNIPA began to be administered by the SAMR. According to the 2018 *"Regulations on the Function Configuration, Internal Organizations and Staffing of the State Administration for Market Supervision Regulation"*, the CNIPA is responsible for guiding trademark and patent law enforcement, formulating and guiding the implementation of rights confirmation and infringement standards of trademarks and patents. It takes the responsibility of setting inspection, appraisal and standards for patent and trademark law enforcement, and establishing relevant mechanisms to bridge policies and standards and facilitate information reporting. The SAMR is responsible for organizing and guiding the enforcement of trademarks and patents.

Article 55 of China's *Anti-monopoly Law* stipulates: "This law is not applicable to undertakings who exercise their intellectual property rights in accordance with the laws and

3966 See Wu Peicheng: "Legislative Reflections of and Rues Reconstruction of the False Promotion System", in *Graduate Students Law*, No. 4, 2017.

administrative regulations on intellectual property rights; however, this Law shall be applicable to the undertakings who eliminate or restrict market competition by abusing their intellectual property rights.

In April 2015, the former State Administration of Industry and Commerce promulgated the *Provisions on the Prohibition of Abuse of Intellectual Property Rights to Exclude and Restrict Competition*, which stipulate the non-price monopoly agreements formed through exercising IP rights and acts of abusing market dominance. In 2017, the Office of the Inter-Ministerial Joint Conference on the Implementation of the Intellectual Property Strategy of the State Council, involving China's Anti-monopoly Law Enforcement Agencies and Intellectual Property Specialized Organs, issued the "*Plan for Implementation of the National Intellectual Property Strategy and Acceleration of the Development of a Major IP Country*" in 2017, which introduced anti-monopoly guidelines for the abuse of intellectual property rights. The guidelines are intended to clarify the criteria for the determination of monopolistic behavior in the field of intellectual property and strengthened the supervision of abuse of intellectual property rights. Specific work was carried out by the then country's Anti-monopoly Law enforcement agencies: National Development and Reform Commission, the Ministry of Commerce, and the State Administration of Industry and Commerce as well as the China National Intellectual Property Office. The above-mentioned four departments drafted the *Anti-Monopoly Guidelines for Abuse of Intellectual Property Rights (Draft Proposal)* in conjunction with their respective functions and practical experience. In March 2017, the Anti-Monopoly Committee of State Council announced the *Anti-Monopoly Guidelines for Abuse of Intellectual Property Rights (Draft for Comment)* to the public and solicited opinions. According to the latest news, the *Anti-Monopoly Guidelines on Intellectual Property* has been adopted in principle by the new Anti-monopoly of the State Council on November 1, 2018, and it will be promulgated soon.

15.2.5.4 Anti-monopoly Exemptions for Specific Industries

Article 7 of China's *Anti-monopoly Law* provides "For industries where State-owned economy holds a controlling position which affects the lifeline of national economy and national security and industries which implement exclusive dealing pursuant to the law, the State shall protect the legitimate business activities of the undertakings, implement control and regulation over the business activities of the undertakings and the prices of their commodities and services pursuant to the law, safeguard the interests of consumers and promote technological advancement." Article 56 states "This Law shall not apply to cooperative or collaborative activities between agricultural producers and rural economic organizations in business activities such as the manufacture, processing, sale, transportation and storage etc of agricultural products."

Chinese legal scholars generally believe that Article 7 of the *Anti-monopoly Law* mainly plays a declarative role. Because China's Anti-monopoly Law does not oppose monopoly status or market dominant position itself, but abuses against market dominant position. Therefore, the abuse by companies in certain monopoly industries, such as monopoly of high prices and tie-in sales, is still subject to anti-monopoly regulations. China's agri-

cultural development is still relatively backward and its foundation is weak. The government should take a variety of protection measures to protect it. Therefore, China's Anti-monopoly Law draws on foreign legislative experience and stipulates that agricultural activities can be excluded from the application of the *Anti-monopoly Law*.³⁹⁶⁷

15.2.6. A Brief Introduction on the Implementation of the Competition Law in China's Digital Economy (cases, compilations, etc.)

15.2.7. Amendments of China's Competition Law and Reform of Regulatory Agencies

15.2.7.1 Amendment of China's Law against Unfair Competition and its Coordination with the Anti-monopoly Law

In the early days of reform and opening up, China's market economic system was yet to be improved. There was no realistic basis for the enactment of Anti-monopoly Law. Hence, in 1993, China enacted the *Law against Unfair Competition* which included not only the content of unfair competition, but also content regarding anti-monopoly regulations. In 2007, China enacted the *Anti-monopoly Law*, which became effective in 2008. Therefore, there is a certain degree of overlap between the *Law against Unfair Competition* of 1993 and the *Anti-monopoly Law*, which is an important reason for the revision of the *Law against Unfair Competition* in 2017.

The Chinese Anti-monopoly Law community generally believes that the first thing to revise and improve the *Law against Unfair Competition* is to delete the existing anti-monopoly provisions so that the revised *Law against Unfair Competition* only adjusts the narrow unfair competition behavior and accordingly, the *Law against Unfair Competition*, which is based on the maintenance of business ethics, would be intrinsically coordinated with the Anti-monopoly Law, which is committed to maintaining free and fair competition and economic vitality.³⁹⁶⁸ Therefore, in order to rationalize the relationship between the *Law against Unfair Competition* and the relevant legal system, Articles 6, 7, 11 and 15, regarding the exclusion and restriction of competition conducted by public utilities, administrative monopoly, low-cost dumping, collusive tendering and bidding respectively³⁹⁶⁹ were deleted when the *Law against Unfair Competition* was amended in 2017. Because of this, a reasonable distinction between the *Law against Unfair Competition* and the *Anti-monopoly Law* was achieved.

3967 See Wang Xianlin, *Competition Law* (3rd Edition), Renmin University of China Press, 2018, p. 210.

3968 See Wang Xianlin: "A Macroscopic Thinking on the Revision of the Law of the P.R.C. against Unfair Competition", in *China Business Management Research*, No. 7, 2014.

3969 See Zhang Mao: "Notes on the 'Law of the PRC against Unfair Competition (Revised Draft)'", see National People's Congress website http://www.npc.gov.cn/npc/xinwen/2017-11/07/content_2031329.htm, last visit date February 2, 2019.

In the process of achieving legal coordination, the revision process of the *Law against Unfair Competition* is also controversial. The most prominent part of the revision is the provision regarding the position of relative advantage. The provision, written as “The acts of abusing the relative advantage position, involving restricting competition yet not subject to the *Anti-monopoly Law*, shall be governed by this Law”³⁹⁷⁰, was suggested in the *Law against Unfair Competition (Revised Draft for Review)* submitted by the State Council of China to the Standing Committee of the National People’s Congress for its review. However, the provision was seriously challenged in the subsequent review by the NPC. One of the challenges was that it actually reduced the criteria for the definition of abuses in the context of the *Anti-monopoly Law*, making criteria for the proof of the market dominant position in the *Anti-monopoly Law* significantly lower. It is easy to cause the escape phenomenon of the *Anti-monopoly Law* to the *Law against Unfair Competition*. As a result, the provision on abuse of the comparative advantage was deleted in the final amendment of the *Law against Unfair Competition*.

15.2.7.2 Tendency of Revision of China’s Anti-monopoly Law

2018 marks the 10th anniversary of the implementation of China’s *Anti-monopoly Law*. The Chinese government launched a revision process for the *Anti-monopoly Law* to better meet the needs of economic and technological development. Some provisions of the current *Anti-monopoly Law* have not fully adapted to the needs of the present and the future. China’s *Anti-monopoly Law* circles and law enforcement agencies are eager to amend the Law. The Anti-monopoly Committee of the State Council of China has included the revision of the *Anti-monopoly Law* in its work plan. The Standing Committee of the 13th National People’s Congress has also included the task into the legislative plan.

In the revision process of China’s *Anti-monopoly Law*, the Office of the Anti-monopoly Committee of the State Council has identified four principles for the revision of the Law: First, it is necessary to crystalize legislative policies from legal practice. China’s *Anti-monopoly Law* has been practiced for 10 years. It is necessary to absorb the experience of law enforcement and the latest research results of competition policy. Second, the revision must reflect national conditions and adapt to the level of economic development of China. It is also necessary to absorb the mature practices and experience of developed countries. Third, the revision needs to fully consider the uncertainty characteristic of the *Anti-monopoly Law* and ensure flexibility of the law while regulating the discretion of law enforcement agencies. Fourth, the revision needs to address the most urgent questions in law enforcement practice.

China’s *Anti-monopoly Law* circle has also put forward many suggestions and directions on the revision and improvement of the *Anti-monopoly Law*. Some scholars believe that competition policy and the corresponding fair competition review system should be included in the *Anti-monopoly Law* in a timely manner, and should not only stay at the level of the State Council’s regulatory documents. It is necessary to further promote the es-

³⁹⁷⁰ Wang Xianlin: “Two Comments on the ‘Law against Unfair Competition (Revised Draft for Review)’”, contained in the 5th edition of *China Business News* on March 2, 2016.

establishment and improvement of a unified, efficient and authoritative *Anti-monopoly Law* enforcement system, as well as the establishment and improvement of the procedural rules of the Law. Some scholars have suggested improving the punishment provisions of the *Anti-monopoly Law*, such as establishing a model of anti-monopoly administrative punishment centered on fines, while abolishing the punishment of confiscating illegal gains.³⁹⁷¹ In addition, some scholars, in view of the development of the digital economy, pointed out that the revision of the *Anti-monopoly Law* must take into account the development of new Internet formats. Under the digital economy, compared with traditional enterprises, the platform has the nature of both the market and enterprises, and it faces competitive characteristics that are vastly different from old ones. For example, it is difficult for traditional enterprises to monopolize the entire market, while platform companies often have a dominant position in the market. Compared with that of traditional enterprises, the monopoly of the platform is more likely to promote rather than harm the market efficiency. Secondly, in addition to the traditional price competition and production competition, the competition between enterprises is mainly reflected in the “Schumpeterian” innovation that will bring about creative destruction, which has largely pose a challenge to the determination of market dominant position.³⁹⁷²

15.2.7.3 Impact of China’s State Institutional Reform on the Implementation of Competition Law

15.2.7.3.1 The Powers of China’s Anti-monopoly Law Enforcement Agencies before the Reform

Since the official implementation of China’s *Anti-monopoly Law* in 2008, according to the Chinese government’s division of agency responsibilities, the National Development and Reform Commission, the Ministry of Commerce, and the State Administration for Industry and Commerce have respectively conducted anti-monopoly Law enforcement. Specifically, the National Development and Reform Commission set up a Price Supervision and Anti-Monopoly Bureau, to investigate and deal with price monopoly behavior according to law. The Ministry of Commerce set up an Anti-Monopoly Bureau. The Bureau is to conduct review on the concentration of undertakings according to law, guide Chinese enterprises abroad to respond to monopoly lawsuits and carry out international exchanges and cooperation in multi-bilateral competition policies. In addition, it undertakes the specific work of the Anti-Monopoly Committee of the State Council as stipulated in the *Anti-monopoly Law*. The State Administration of Industry and Commerce established an Anti-Monopoly and Anti-Unfair Competition Enforcement Bureau based on the former Fair Trade Bureau. The duties of the new Bureau are as follows: to formulate relevant anti-monopoly and anti-unfair competition measures; to undertake relevant anti-monopoly law enforcement work; to investigate and deal with illegal eco-

3971 See Legal Daily website http://www.legaldaily.com.cn/zt/content/2018-08/03/content_7610204.htm?node=92192, last visit date February 2, 2019.

3972 See Xinhuanet http://m.xinhuanet.com/tech/2018-11/21/c_1123743755.htm, last visit date February 2, 2019.

conomic cases involving unfair competition, commercial bribery, smuggling, etc., and to supervise the handling of major or typical cases.³⁹⁷³

15.2.7.3.2 Unified Anti-monopoly Enforcement after the Reform

The above-mentioned mechanism for jointly implementing China's *Anti-monopoly Law* by the three institutions has been aptly called the "troika" by the academic circle. The implementation mechanism of this "Anti-monopoly Law" had continued until 2018. At the beginning of 2018, the CPC and Chinese government carried out institutional reforms of many central and state agencies, including anti-monopoly law enforcement agencies. According to the *Plan of the Central Committee of the Communist Party of China to Deepen the Reform of the Party and State Institutions*, China established the State Administration for Market Regulation (the ministerial level) in 2018 as a dedicated agency directly under the State Council. All the anti-monopoly enforcement duties of the NDRC, the Ministry of Commerce and the former SAIC began to be performed by the SAMR. Meanwhile, the SAMR also undertakes the work of the Anti-Monopoly Committee of the State Council.

For the three-in-one move of China's Anti-monopoly Law enforcement agencies, Chinese Anti-monopoly Law scholars and law enforcement officials generally expressed their welcome. Some commentators believe that the reform of anti-monopoly law enforcement agencies have the following features. First, it has eliminated the overlapping of functions of the three agencies, which is conducive to improving law enforcement resources and enhancing regulatory efficiency. Second, it has improved the top-level design of the anti-monopoly regulatory system, which is beneficial to build a fair competitive market environment and serve people's needs for a better life. Third, it has increased the predictability and uniformity of anti-monopoly law enforcement, which is conducive to promoting the rule of law, fostering a favorable international business environment, and advancing China's high-level two-way opening-up.³⁹⁷⁴

After taking up a unified anti-monopoly law enforcement function, the SAMR has begun to carry out corresponding anti-monopoly law enforcement work. In December 2018, the SAMR issued the *Notice of the SAMR on Anti-monopoly Enforcement Authorization* ("SAMR anti-monopoly [2018] No. 265"), which states that the SAMR and market regulations at provincial levels, within their respective powers, can conduct law enforcement of monopoly agreements, abuse of market dominant position, and administrative monopoly. In addition, the concentration of undertakings is still subject to the review of the SAMR. In order to further detail the Anti-monopoly Law enforcement work, the SAMR issued to the public the *Regulations on the Suppression of Abuse of Administrative Power to Exclude and Restrict Competition (Draft for Comment)*, the *Regulations on Prohibition of Monopoly Agreements (Draft for Comment)*, and the *Regulations on the Prohibition of the Abuse of the Market Dominant Status (Draft for Comment)*. And they will soon be made into departmental rules for the use of enforcement agencies.

3973 See CCTV website <http://jingji.cntv.cn/special/dxltfld/20111113/106210.shtml>, last visit date February 3, 2019.

3974 See the Chinese Government website http://www.gov.cn/xinwen/2018-11/16/content_5341034.htm#1, last visit date February 5, 2019.

15.2.7.3.2 Private Implementation of China's Anti-monopoly Law and Establishment of the IP Court of the Supreme People's Court

China's *Anti-monopoly Law* is not only publicly implemented by the anti-monopoly law enforcement agencies, but also privately implemented by the certain bodies with courts as main participants. In 2012, the Supreme People's Court of China promulgated the *Provisions on Several Issues Concerning the Application of Laws in the Trial of Civil Disputes Caused by Monopolistic Behaviors*, to clarify such issues as the prosecution, case acceptance, jurisdiction, burden of proof, evidence of litigation, civil liability and statute of limitations. Especially in 2018, China made a large-scale reform of the litigation and trial system involving patents and monopoly cases. According to the *Decision on Several Issues Concerning the Proceedings of Intellectual Property Cases Such as Patents* adopted by the Standing Committee of the National People's Congress on October 26, 2018, if the parties are not satisfied with the judgments and rulings of the first-instance civil and administrative monopoly cases, the second instance shall be directly heard by the Supreme People's Court. Immediately thereafter the Supreme People's Court of China issued a judicial interpretation *Provisions of the Supreme People's Court on Certain Issues Concerning Intellectual Property Courts*, promulgating the establishment of the dedicated Intellectual Property Court of the Supreme People's Court to uniformly handle cases such as monopoly and patents in the second instance. According to relevant reports, the Supreme People's Court unifies the trial of monopoly and patent cases because such cases, more technical and challenging to try, have a profound impact technological innovation and are crucial to the building of an innovation-driven country.³⁹⁷⁵ The Supreme People's Court's second trial of the cases is also conducive to the unification and standardization of the referee scale. The IP Court of the SPC of China has begun to accept and hear cases.

³⁹⁷⁵ See Zhou Qiang: "Explanations of the 'Decision on Several Issues Litigation Procedures of Cases including Patent (Draft)'", a speech at the Sixth Session of the Standing Committee of the 13th National People's Congress on October 22, 2018, see China Court website <http://www.court.gov.cn/zixun-xiangqing-125521.html>, last visit date February 5, 2019.

Chapter 16: Country Report – South Africa

16.1. Introduction

South Africa, as developing countries are, as is the case with the remaining BRICS countries, subject to the same economic forces and thus, its digital markets are also dominated by the same cast of players, being Facebook, Amazon, Google and Apple. A major problem for South Africa is the appropriateness of South African legislation and regulatory system's capacity to deal with the challenges posed by the digital economy, in particular that the current regulatory framework in many cases does not apply to new, disruptive technology; for example Public and Free-to-air (FTA) broadcaster licensees, subject to local content requirements have the problem that streaming services are not licensed and hence not subject to the same regulatory constraints. Further, there is a limited ability of the competition authority to impose a jurisdictional reach on these global entities.

This report is arranged as follows: the state of the digital economy is first set out, then the regulatory framework is examined. The next section deals with the specific question of competition law and finally there is a summary of case law that has been decided over the twenty year existence of the competition authority.

16.2. Part a: background

a. Internet penetration in South Africa

Internet penetration has grown rapidly with the rise of mobile technologies but remains relatively low compared to other middle-income countries.³⁹⁷⁶ Overall, internet penetration is estimated to be between 40% to 54% compared to a global average of about 57% in 2019.³⁹⁷⁷ Internet use is also a relatively 'new' phenomenon with users reporting that they have, on average, been using the internet for only 6 years.³⁹⁷⁸

The latest General Household Survey (GHS) conducted by Statistics South Africa shows that only 64.7% of South African households reported that 'at least one member of the household' had access to the internet in 2018. Most of those with access to the internet

³⁹⁷⁶ Gillwald, A; Mothobi, O and Rademan, B. 2018. The State of ICT in South Africa. Published by ResearchICTAfrica.net. Available at https://researchictafrica.net/after-access-south-africa-state-of-ict-2017/south-africa-report_04.pdf

³⁹⁷⁷ A 2017 study by research and strategy organisation World Wide Worx estimated internet penetration at 40% in 2017. A nationally representative survey by ResearchICTAfrica.net estimated internet penetration of 53% in 2017 and a Hootsuite Survey of 285 000 internet users estimated penetration of 54% in 2018.

³⁹⁷⁸ We note that the average age of internet users is not reported.

(60.1%) accessed the internet via a mobile device. The next most common means of accessing the internet is 'at work', with 16.2% of households indicating that at least one member of the household had access to the internet at work. Only 10.4% of South African households have access to the internet at home.³⁹⁷⁹

Internet penetration varies significantly across the country, with a stark rural/urban divide. At a household level, internet penetration is highest in Gauteng, the economic hub of the country, where 74.6% of households indicated that at least one member of the household had access to the internet (though only 16.7% had access to internet at home) and lowest in Limpopo, where only 46.2% of households indicated that at least one member of the household had access to the internet (and only 1.7% had access to the internet at home).

At an aggregate level, the Western Cape has the highest internet penetration with 75% of the population having access to the internet, followed by Gauteng at 54.7%, KwaZulu-Natal at 39.2%, Free State at 36.1%, the Northern Cape at 32.9%, North West at 32.1%, and Mpumalanga at 26.5%.³⁹⁸⁰

The rural/urban divide is evident in both internet penetration and smartphone access. In 2017, internet access among urban residents was estimated to be 61%, up from 41% in 2012. Internet access in rural areas was much lower at only 39% in 2017, though this was nearly double the rate of 21% reported in 2012.

Mobile phone access is similarly divided along rural/urban lines. The majority (84%) of South Africans have access to a mobile phone with more than half (56%) having access to a smartphone. More than half the urban population (54%) owned smartphones in 2017 compared to only 33% of those in rural areas.³⁹⁸¹ In absolute terms, this equates to about 29mn smartphones in South Africa, though reportedly only 21mn smartphones are in use. Researchers posit that the other 8mn smartphone owners cannot (regularly) access data, presumably because of the high cost of mobile data (to be discussed in more detail below). Researchers further reported that there is a very strong link between a reduction in mobile data prices and increase in usage, which points to massive pent-up demand for data and internet access at the bottom end of the market.³⁹⁸²

b. Composition of internet use

In addition to geographic disparities, internet access varies according to income, gender and level of education (which may be a proxy for income). Male-headed households are more than twice as likely to have access to internet than female-headed households

3979 Statistics South Africa. 2018. General Household Survey, 2018. Available at <http://www.statssa.gov.za/publications/P0318/P03182018.pdf>

3980 Mcleod, D. 2017. Internet access in SA: rural areas falling far behind. Tech Central. Available at <https://techcentral.co.za/internet-access-sa-rural-areas-falling-far-behind/75789/>

3981 Gillwald, A; Mothobi, O and Rademan, B. 2018. The State of ICT in South Africa. Published by ResearchICTAfrica.net. Available at https://researchictafrica.net/after-access-south-africa-state-of-ict-2017/south-africa-report_04.pdf

3982 Shapshak, T. 2017. South Africa has 21 million internet users, mostly on mobile. Forbes. Available at <https://www.forbes.com/sites/tobyshapshak/2017/07/19/south-africa-has-21m-internet-users-mostly-on-mobile/#7a1073ee1b2d>

(though it is notable that it is more likely that both parents are present in male-headed households). Fifteen percent of male-headed households have access to the internet while only 7% of female headed households do.

On aggregate, internet use and smartphone ownership are higher amongst males than females. Internet access penetration amongst females is 50% while it is 56% amongst males. Though females are more likely (85%) to have a mobile phone than men (83%), men are more likely to have a smartphone (50%) than females (43%).

There is no credible data source for the age profile of internet users in South Africa. The most frequently cited source is a study by *Effective Measures* released in 2018. The study is based on interviews with 285 000 South African internet users conducted in 2017.³⁹⁸³ It shows that more than 80% of South African internet users are between below the age of 44 and that the largest proportion of internet users (32.94%) are between 25 – 34 years old.

Table 1: Age breakdown of internet users in SA

Age range	Percentage of total
15-19	10.06%
20-24	22.77%
25-34	32.94%
35-44	16.89%
45-49	6.37%
50-54	3.06%
55-64	4.73%
>65	3.18%

Source Effective Measures (2018)

Income (or lack thereof) remains one of the most important factors determining digital inclusion. Among adult South Africans earning more than R30 000/month (about \$2 000), internet penetration is 82.4%. Internet penetration declines rapidly as income declines, falling to 61.3% for those earning between R14 000 (\$916)- R18 000 per month (\$1 177), 42% for those earning between R3 000 (\$196) – R6 000 per month (\$392), and below 30% for those earning below R2 500/month (\$164).³⁹⁸⁴

The nationally representative 'After Access' survey confirms that differences in internet access are largely driven by poverty (or income). They estimate that nearly all of those who do not have access to the internet earn less than R7 000 (\$458 at 178Aug) per month while those earning above this threshold are largely connected. However, even at low incomes, location matters. Amongst very low-income earners who earn approximately R1 538 (\$100) per month (which is more or less equal to the old age pension grant), those living in urban areas are more likely to use the internet than those living in rural areas.

³⁹⁸³ MyBroadband. 2018. What we know about internet users in South Africa. Available at <https://mybroadband.co.za/news/internet/251063-what-we-know-about-internet-users-in-south-africa.html>

³⁹⁸⁴ Mcleod, *ibid*. Income converted at ZAR/USD exchange rate of R15,29 on 18 Aug 2019 as reported by Oanda.

Education is also an important barrier to internet access. This is unsurprising as education is correlated with employment and income. The disparity is telling and emphasises the mutually reinforcing nature of various forms of inequality (in wealth, income, gender and location). For people with a primary school education, fewer than 20% have access to the internet regardless of other characteristics (e.g. age, gender and income). For people with some high school education, but who have not completed high school, fewer than 40% have internet access. For those with the post-high school qualification, 71.6% have internet access, on average.

In summary; across the country, internet access at home and at work remains very low and consumers rely mostly on mobile technologies to access the internet. The cost and quality of mobile data is thus critical in facilitating internet access. Further, various forms of inequality (in wealth, income, gender and location) coincide with internet access. This is particularly worrying as internet access lowers the cost to communicate through the use of over-the-top services such as WhatsApp. A lack of access to the internet may thus deepen inequality as returns to internet access increase.

c. How do South Africans access the internet?

South Africans mostly access the internet via mobile devices. South Africa has one of the highest mobile connectivity rates in the world. Based on Q42018 GSMA Intelligence data, SA's mobile coverage rate is 170% (measured as connections/population), which is much higher than the global average of 115%. Most of the mobile devices (84%) are pre-paid (compared to 75% being pre-paid globally).³⁹⁸⁵ Of about 21 million internet users in 2018, 7 million accessed the internet exclusively via mobile technologies.

Internet access using fixed lines is low and decreasing with most households that have access to the internet using either mobile phones (43%) or dongles (36%). However, in terms of national coverage, fixed lines remain important as much of the country (and rural areas in particular) are covered by the transmission infrastructure of former state-owned fixed line monopoly, Telkom.

Telkom is dominant in fixed-line infrastructure with a market share of about 73% and 150 000 km of fibre. The second largest fixed provider is Broadband Infraco, a state-owned company, with a 14% market share. In joint third place are private providers: Neotel, Vodacom and MTN with an estimated 3% market share each.

ResearchICT Africa reports that while competition in the international transmission market has improved with the landing of several undersea cables, national transmission remains a challenge. Former state-owned monopoly, Telkom has more fibre than all other players combined and although there have been complementary investments in urban areas; both peri-urban and rural areas are still mainly reliant on Telkom's infrastructure which still confers some pricing power.³⁹⁸⁶

³⁹⁸⁵ Hootsuite. 2019. Digital 2019. Available at <https://hootsuite.com/pages/digital-in-2019#accordion-115547>

³⁹⁸⁶ Gillwald, A; Mothobi, O and Rademan, B. 2018. The State of ICT in South Africa. Published by ResearchICTAfrica.net.

In recent years, however, there has been significant activity in the FTTx space with rapid acceleration in fibre rollouts. In 2015 fibre accounted for only 3% of total fixed-line subscriptions. This grew nearly 7-fold to 20% of all fixed-line subscriptions in 2018. Though the impressive fibre rollout in South Africa is starting to compete with mobile providers constrained by the lack of LTE spectrum, fibre is heavily skewed towards urban areas, thus reinforcing the rural/urban divide.

Given the importance of mobile data in driving internet access in South Africa, we provide a brief overview of the mobile telecommunications market below.

d. Mobile telecommunications

There are four main mobile internet service providers in South Africa: Vodacom, MTN, Telkom Mobile, and Cell C. Vodacom and MTN were the first entrants into the South African and both started operating in 1994. They were followed by Cell C who entered in 2001, and Telkom Mobile which entered the market in 2010. Based on mobile service revenue for 2018, Vodacom's market share was 49.8%, MTN had a market share of 33.5% and Cell C and Telkom lagged with shares of 12% and 4.7% respectively.³⁹⁸⁷ The market shares are similar in terms of number of subscribers.

In 2018, Vodacom's market share in terms of subscribers was 43.8%, MTN had a market share of 31.8%, Cell C had a market share of 17.2% and Telkom had a market share of 5%. The rest of the market (<2%) is made up of several MVNOs including Hello Mobile, Virgin Mobile, Me&You Mobile, MRP Mobile, and FNB Connect.³⁹⁸⁸

In the preceding sections we emphasised the importance of mobile phones in driving internet access as well as high mobile phone penetration in South Africa. But, despite high mobile coverage, usage remains low. This is mainly explained by relatively high prices of mobile data in a country with significant levels of poverty.³⁹⁸⁹ Cost, and particularly the cost of mobile data, remains a critical factor inhibiting internet access. This is discussed in more detail below. First, we provide an overview of mobile coverage.

e. Availability of Internet networks

Mobile coverage in South Africa is near-universal. According to Vodacom's 2019 Annual Integrated Report, nearly 100% of the South African population is covered by Vodacom's 2G network and 99.5% of the country is covered by its 3G networks. As at 31 March 2019, 90.4% of the country was covered by its 4G network.³⁹⁹⁰ MTN's 2G and 3G networks also

³⁹⁸⁷ Note that mobile service revenue includes retail revenue from the provision of mobile-cellular communication services, including all voice, SMS and data services. Data sourced from Competition Commission Market Inquiry into Data Prices, Available at <http://www.compcom.co.za/data-market-inquiry/>

³⁹⁸⁸ Competition Commission of South Africa. 2019. Data Services Market Inquiry Provisional Findings and Recommendations.

³⁹⁸⁹ In 2017, more than half of South Africans (55.5%) lived below the upper bound poverty line of approximately \$65 per person per month according to Statistics South Africa's "Poverty Trends in SA" report, available at <https://www.statssa.gov.za/publications/Report-03-10-06/Report-03-10-062015.pdf>.

³⁹⁹⁰ Vodacom Limited Integrated Annual Report. 2019. Available at <http://vodacom-reports.co.za/integrated-reports/ir->

cover nearly 100% of the population. MTN reported that their 4G coverage reached 90% in November 2018.³⁹⁹¹

f. Affordability of mobile data

The cost to communicate in South Africa is high; in fact, higher than in most other African countries. In Q12018, South Africa is ranked 35 out of 49 African countries on RIA's Africa Mobile Pricing Index which measures the price of 1GB of prepaid data across a number of countries.³⁹⁹² This is drop of 5 places from its ranking in late 2017. The cheapest prepaid 1GB bundle in South Africa (at R99 or ~\$6.5, see *Table 2*), was more than 6 times the cheapest 1GB bundle of ~\$1.1 available in Egypt.³⁹⁹³

Concerns about the high cost of mobile data in South Africa were an important reason for the launch of the Competition Commission's market inquiry into mobile data services ('Data Inquiry'). The provisional findings of the Data Inquiry confirm that the cost of South Africa's mobile data is not only high, but that prices are higher at lower levels of use which discriminate against poorer users.

The Data Inquiry made the following provisional findings with respect to affordability:

- i. **International benchmarking confirmed that South African data prices are high, particularly for mobile prepaid data.** Specifically, the inquiry found that South Africa's prices compare poorly to other African countries, its BRICS counterparts and that South African mobile operators charge higher prices in South Africa than in other countries in which they operate.
- ii. **Post-paid data prices are cheaper than prepaid prices (Table 2).** This may discriminate against poorer users as post-paid (contract) customers tend to be consumers with a steady (and higher) income.
- iii. **Smaller data bundles are much more expensive, on a MB per MB basis, than larger data bundles. (Table 3).** The Data Inquiry found that smaller data bundles can up to five times more expensive, on a MB per MB basis, than larger data bundles (see the comparison between a 5MB bundle on the MTN network and a 2GB bundle on the same network in *Table 3* below). The inquiry found that this pricing may be anti-poor, as consumers with less disposable income are more likely to purchase smaller data bundles.

Table 2: Prepaid and post-paid data prices for 1GB bundle (2018)

Operator	Data Package	Prepaid Price	Postpaid Price
Telkom	1GB	R99	R99
Vodacom	1 GB	R149	R86

g. Is universal service for Internet access available? What are the forms it takes?

The mobile sector has come closest to achieving the universal coverage, with nearly the entire country covered by 2G and 3G.³⁹⁹⁴ Universal Service has been a policy thrust of government since at least 1995, when the first democratic South African government released its White Paper on Telecommunications. The ICT White Paper released in October 2016 affirms this position, advocating strongly for universal access.

Universal service obligations have been included in the licence conditions of all mobile operators as well as fixed line operators Telkom and Liquid Telecom (formerly Neotel). All telecommunications licensees are also required to contribute to the Universal Service Access Fund administered by the Universal Service and Access Agency of South Africa (USAASA), established in 2006 to fund and implement projects to promote universal service provision.³⁹⁹⁵ Prior to the creation of the USAASA, telecommunications licensees were individually responsible for the implementation of their own universal service obligations, and the lack of coordination resulted in fragmentation and the inefficient duplication of infrastructure.³⁹⁹⁶ USAASA will play a coordination role in the rollout of universal service obligations with the aim of removing duplication and expanding coverage.

³⁹⁹⁶ Cape Digital Foundation. Are we there yet? South Africa's universal service and access obligation (USAO) framework in review

16.3. Digital Economy Growth levels in the last 5 years

a. The extent of e-commerce in South Africa

Estimates by Visa and Euromonitor indicate that the market for online retail in South Africa reached approximately R10bn (\$657mn) in 2017. This translates into only 1% of the total retail market which was estimated to be R 1 trillion in 2017.³⁹⁹⁷

Despite the increasing level of internet and mobile penetration, South Africa still lags other countries in e-commerce use. A 2019 survey of internet users found that only 55% of internet users reported buying something online via any device in the month preceding the survey. This is the second lowest figure in the survey, with only Egypt reporting lower use at 47%. The global average was 75%.³⁹⁹⁸ The average spend on consumer goods per e-commerce user is also still low. In 2018 SA reported average spend of \$90, equivalent to 1% of total retail spend, compared to a global average of \$634 per user.³⁹⁹⁹

Takealot is the largest online retailer in South Africa.⁴⁰⁰⁰ It started operating in 2011 as an online shopping platform and has expanded to acquire a food and goods delivery business (Mr Delivery). It has also established several warehouses in major economic centres across the country, and recently started rolling out 'pickup points' at shopping centres, garages on major motorways and office parks. The rollout of physical warehousing is an important competitive advantage against international platforms and potential entrants because of the associated advantage in order fulfilment. However, Takealot it still has some notable competitive disadvantages relative to international competitors as it does not have an e-books, movie streaming and music streaming offering; nor the international scale and brand presence as international competitors.⁴⁰⁰¹

Takealot is currently estimated to have a revenue market share in online revenue from mid-teens to about 30%.⁴⁰⁰² It has grown at a compound annual growth rate of more than 100% [107%] over the past 4 years.⁴⁰⁰³ Takealot is controlled by Naspers, the South-African based internet and media conglomerate, which holds a 96% stake in the firm. In addition to its stake in Takealot, Naspers controls a number of other technology companies in South Africa including nice online clothing retailers Spree and Superbalist, online payment systems company PayU, an internet data research company called Similarweb and online classifieds platforms OLX and Autotrader. Naspers operates in more than 120 countries, and has multiple investments across the BRICS countries. It holds shares in Chinese social networking and gaming firm 'Tencent', Indian online travel company 'MakeMyTrip', Brazil mobile marketplace 'Movile' and Russian internet firm 'Mail.

4003 Ibid.

ru', amongst others. It also holds shares in broadcast and print media as well as online classifieds.

b. Most popular social networks

South Africans mainly use the internet to access social networks. This is in line with the main internet uses in other markets.⁴⁰⁰⁴ Most (73%) internet users in South Africa reported that they use the internet for social networking or to look for employment opportunities.⁴⁰⁰⁵ Hootsuite reports social media penetration of 40% in 2018, compared to worldwide average of 45%. This is based on number of active social media users across all platforms compared to total population. For users over 13 years old, social media penetration increases to 53% compared to global average of 58%.

WhatsApp is the largest social network in South Africa with an estimated 16 million users at the end of 2016 (out of a total of 21 million internet users at the time). It is followed closely by Facebook with 15 million active users, YouTube with 8.5 million, Twitter with 7.5 million and LinkedIn with about 5 million.⁴⁰⁰⁶ There is evidence of multi-homing amongst South African internet users, with the Hootsuite reports finding that South Africans have an average of 8.5 accounts per user.

c. Corporate finance for the digital economy

To the best of our knowledge, no systematic study of corporate finance for the digital economy has been conducted. A study by the University of Johannesburg's Centre for Competition, Regulation and Economic Development into barriers to entry in the telecommunications sector explored historical funding for fixed fibre. It found that traditional funders (banks) were generally wary of providing funding to digital start-ups because the rapid pace of change in tech markets increased the risk that the technology they funded would become obsolete prior to realising the requisite return on investment.⁴⁰⁰⁷ An alternative form of funding emerged in terms of a closed network of 'serial technology entrepreneurs' who fund new entrants and associated businesses. In fixed fibre, for example, much of their initial funding came from individual entrepreneurs previously involved in the establishment of firms such as Dimension Data that were amongst the first in South Africa to offer customised and off the shelf digital solutions. These entrepreneurs provided investment to South Africa's first dark fibre provider, Dark Fibre Africa, as well as to firms in the fibre value chain that manufactured inputs, provide trenching services and rolled out lit FTTx services.

One of the most significant corporate players in the digital space is Remgro, a diversified investment holding company with interests in financial services (banking and in-

4004 Digital in 2018: World's Internet Users pass the 4 billion mark. Available at <https://wearesocial.com/uk/blog/2018/01/global-digital-report-2018>. Last viewed on 25/02/2019.

4005 Gillwald, A; Mothobi, O and Rademan, B. 2018. The State of ICT in South Africa. Published by ResearchICTAfrica.net.

4007 Hawthorne, R; Mondliwa, P; Paremoer, T and Robb, G. 2016. Competition, Barriers to Entry and Inclusive Growth: Telecommunications Sector Study. Published by University of Johannesburg.

insurance), healthcare, consumer products, industrial products, infrastructure and media and sport. Remgro's infrastructure portfolio includes a 30% stake Seacom; Africa's first broadband submarine cable system along the Southern and Eastern African coast, a 51% stake in Dark Fibre Africa (through its share in CIV group) and; through CIV Group also holds interests in FTTH provider Vumatel.

Naspers, mentioned above (see 3.a.), is also actively investing in the digital technologies. Naspers recently established a R1.4bn (\$92mn) start-up fund called Foundry, which is aimed at boosting South Africa's tech sector. Its first deal, announced in June 2019, was a R30m (\$2mn) investment in tech start-up 'SweepSouth' an online cleaning services portal.

Other than these, most of the funding seems to come from private equity and development finance institutions. This is particularly evident in the fintech space where former CEO of First National Bank, Michael Jordaan, has been instrumental in setting up data-only mobile network Rain and the digital bank 'Bank Zero' and African Rainbow Capital's Patrice Motsepe has also recently bought a 25% stake in digital bank Tymebank with branches in Pick n Pay, one of the largest national retailers in the country. Other venture capital and private equity investors include Angelhub (of which Michael Jordaan is part), 4Di Capital, and NewGx Capital. Development finance institutions who invest in the technology area include the Industrial Development Corporation, the Technology Investment Agency and the Technology Venture Capital Fund managed by the IDC on behalf of *the dti*.

d. Level of development of the IoT and Industry 4.0.

This is discussed under section 4: the institutional framework for the digital economy

e. Please specify the major digital platforms and their market penetration.

According to data-gathering site Statcounter, Google is the most popular search engine in South Africa with 95.44% market share. Bing, Yahoo and DuckDuckGo lag behind with 3.45%, 0.79% and 0.17% respectively.⁴⁰⁰⁸ In terms of operating systems, the dominance of mobile in accessing the internet is again evident. Android is the largest at 53.49%, followed by Windows with 22.13%, and iOS at 11.47%.⁴⁰⁰⁹

f. What is the level of development of the blockchain economy?

Blockchain development is at an exploratory/early testing stage. Banks, brokerages, insurers, regulators, and other financial services providers are testing ways to harness the benefits of blockchain. The South African Reserve Bank has recently launched an initia

4008 Statcounter. Search Engine Market Share in South Africa, July 2018 – July 2019. Available at <https://gs.statcounter.com/search-engine-market-share/all/south-africa>

4009 Statcounter. Search Engine Market Share in South Africa, July 2018 – July 2019. Available at <https://gs.statcounter.com/os-market-share/all/south-africa/#monthly-201807-201907>

tive called Project Khokha which aims to obtain a better understanding of blockchain (or distributed ledger) technology in the payments system.⁴⁰¹⁰

In 2018, various regulatory entities in the financial sector including the Financial Intelligence Centre (FIC), Financial Sector Conduct Authority (FSCA), National Treasury (NT), South African Revenue Service (SARS) and the South African Reserve Bank (SARB) launched an intergovernmental working group to develop a common understanding amongst fintech regulators on digital developments in financial services, including crypto assets.

16.4. What is the institutional framework for the digital economy?

At the end of 2018, the President constituted a Presidential Commission on the Fourth Industrial Revolution tasked with developing a coordinated national response to the challenges and opportunities associated with the Fourth Industrial Revolution, including the digital economy.⁴⁰¹¹ The Terms of Reference for the Presidential 4IR Commission places significant emphasis on achieving global competitiveness across all key economic sectors but the details of the digital/4IR strategy still need to be developed. The Competition Commissions is not directly represented on the Presidential 4IR panel but has offered its support to the panel and is engaging with the core workstreams.

In addition to the efforts within the Presidency, the Department of Trade, Industry and Competition, through its Industrial Development Think Tank (IDTT) situated at the University of Johannesburg, is developing the elements of a Digital Industrial Policy. The IDTT has explored the effects of 4IR technologies on various sectors including lights manufacturing (plastics), metals and machinery, textiles, automotive manufacturing and retail, amongst others. In retail markets, they have focused on the disruptive effects of the e-commerce platforms emphasising that a (future) national policy should prioritise digital policies that reduce the cost of internet access in order to stimulate online retail.⁴⁰¹²

The IDTT found that 4IR technologies have been incorporated into various sectors of the economy; listing examples such as using additive manufacturing to 'machine' replacement parts for mining equipment, using 'Internet of Things' applications for preventative maintenance and using advanced (tracking and inventory management) technologies in logistics and warehousing. However, adoption and levels of sophistication in using 4IR technologies in production processes remains low.

a) What is protected by property rights (rights to exclude, transfer and monetise)?

- Intellectual property rights in the digital economy

- Are there property rights on non-personal/industrial data and algorithms?
- Are there any property rights on personal data?
- Specific regulatory regimes

b) Brief presentation of the current regulatory framework

The telecommunications sector is regulated by the Independent Communications Authority of South Africa (ICASA). Policy is set by the Department of Communications and Digital Technologies which was formed in June 2019 through the consolidation of the former Department of Communication and Department of Telecommunications and Postal Service.

The overarching policy direction for the sector is set out in the 2016 National Integrated White Paper. The White Paper sets broad objectives for addressing the universal access gap, establishes a governance framework for the internet (including principles such as net/search neutrality), sets out the principles for a coherent e-government strategy, and provides a framework for addressing access challenges (including rapid deployment and open access with respect to infrastructure as well as addressing spectrum allocation principles).⁴⁰¹³ Much of the policy direction set out in the White Paper has since been advanced through the release of issue- or sector-specific policies such as the policy direction on unassigned high demand spectrum released in July 2019, and the national e-strategy released in November 2017.⁴⁰¹⁴

The primary piece of legislation governing the telecommunications sector is the Electronic Communications Act, 36 of 2005 (as amended) (ECA) which establishes ICASA. The ECA is seen as pro-competitive providing, for example, for the regulation of interconnection, price regulation, facilities leasing and rapid deployment.⁴⁰¹⁵ It also contains provisions to address market power and promote competition, meaning that the ECA and the Competition Act have overlapping and concurrent jurisdiction with respect to competition in the telecommunications sector. The competition authorities are mandated to intervene where abuse of dominance has occurred, thus providing *ex post* regulation while ICASA is empowered to conduct market reviews and impose forward-looking remedies.⁴⁰¹⁶

c) For access to data (including price/rates regulation)

The Protection of Personal Information Act 4 of 2013 (POPI) was signed into law in November 2013 but many substantive provisions of the law have not yet come into effect.

⁴⁰¹³ The National Integrated White Paper is available [here](#).

⁴⁰¹⁴ The Policy Direction on high demand spectrum is available [here](#) and the national e-strategy, as well as other issue- or sector-specific policies, are available [here](#).

⁴⁰¹⁵ Cull, D. 2009. Key considerations in telecommunications regulation: An overview of the South African position.

⁴⁰¹⁶ Hawthorne, R., Bonakele, T., & Cull, D. (2014). Review of economic regulation of the telecommunications sector. Retrieved from http://www.competition.org.za/s/1400407_EDD-UJ_RECBP_Project-Report_App10_Telecommunications-Sector-Review_Final.pdf

That which has been brought into force concern the appointment of the information Regulator pursuant to which regulations were promulgated in December 2018. *The core of the Act which deals with the safeguarding of personal information pursuant to the constitutional right to privacy while protecting the free flow of information within and across the boundaries of South Africa is expected to come into effect in 2019 .Thereafter firms will be given 1 year to become complaint after it comes into effect.*

POPI provides consumers with the following rights:

- The right to be informed about how their personal data will be used,
- The right to know whether personal data is held by a data collector and to request access to their data,
- The right to have their personal data rectified or erased, specifying that data controllers must respond to such a request within a month,
- The right to restrict data processing on request from the data owner, and
- It specifies that data owners must opt-in to direct marketing programmes.

The right to data portability is not explicitly provided for in POPI.⁴⁰¹⁷

POPI will be enforced by the Information Regulator.

d) For access to algorithms/smart data (including price/rates regulation)

The 2016 National Integrated ICT White Paper, a precursor to legislation, calls for net neutrality on all South African operators and service providers. It provides for ICASA, the telecommunications regulator, to make recommendations on whether new or amended legislation is required to reinforce net neutrality, including guidelines on zero-rating, barring, throttling or paid prioritisation of traffic.⁴⁰¹⁸ These regulations have not yet been developed.

e) Digital consumer protection specific instruments

See the summary of the Information Regulator in section 4(c) above

- Privacy/data protection regulation
- General
- Sector-specific

⁴⁰¹⁸ National Integrated ICT Policy White Paper. September 2016. Available [here](#).

16.5. Institutional architecture

a. Is there a digital platforms regulator?

No, South African has no digital platforms regulator. Currently the regulatory framework does not provide powers to ICASA, the telecommunications sector regulator, to regulate digital platforms. Digital platform players mainly sit “over-the-top” and are not licensees of the telecommunications authority.⁴⁰¹⁹

16.6. PART B: COMPETITION REGULATION

What is the role of the competition authority (authorities)?

- What is the role of courts (generalist or specialised) in enforcing competition law and regulatory (structure, price and access regulation) ?
- South Africa has a specialist system of courts in that the court of first instance is the Competition Tribunal staffed by lawyers and economists ,Any a referral from the Competition Commission , the investigation agency ,three members decide the case. There is a direct appeal as of right to the Competition Appeal Court which is staffed by \ judges of the High Court appointed on the basis of their expertise in the field. From this court there is a further appeal with its leave to the Constitutional Court.

There is no formal Interaction between competition law and regulation in the digital economy context in particular

- Competition authorities and general or sector-specific access and pricing regulators
- Competition authorities and data protection agencies
- Competition authorities and digital consumer protection agencies (indicate if the competition authority is also functioning as a consumer protection regulator)

Describe the competition law activity related to the digital economy since 2001 (please include a summary and a compilation of the various individual fiches prepared for each case. Please include information on market definition, theories of harm)

There are three areas where competition law has held implications or future implications for the digital economy ; cartels / collusion , abuse of dominance and mergers.

4019 E-mail communication with ICASA, 12 August 2019

16.6.1. Cartels:

The definition of cartel behavior / collusion is set out in s4 of the Competition Act of 1998 , as follows:

"4 (1) An agreement between, or a concerted practice by, firms, or a decision by an association of firms, is prohibited if it is between parties in a horizontal relationship and if-

(b) it involves any of the following restrictive horizontal practices:

(i) directly or indirectly fixing a purchase or selling price or any other trading condition; (ii) dividing markets by allocating customers, suppliers, territories, or specific types of goods or services; or (iii) collusive tendering." [See Section 4 (1) (b) of the Competition Act]

The prohibitions on collusion are triggered by certain types of conduct rather than by outcomes themselves. For example, the question is whether the conduct (agreement or a concerted practice or a decision) of firms (in a horizontal relationship) in relation to, for example, price is a result of an agreement or concerted practice or decision. If not, there is no violation. What then is an agreement?

The Competition Act defines an agreement "in relation to a prohibited practice, to include a contract, arrangement or understanding, whether or not it is legally enforceable".[See Section 1 (ii) of the Competition Act.]

A concerted practice arises from "cooperative or coordinated conduct between firms, achieved through direct or indirect contact that replaces their independent action but which does not amount to an agreement". [See Section 1 (vi) of the Competition Act.] Therefore, a concerted practice may inter alia arise out of coordination which becomes evident from the conduct of firms in the market. The idea that a concerted practice may be inferred from behaviour might seem to suggest, at first glance, that interdependent oligopoly behaviour is prohibited. However, oligopoly behaviour does not establish a concerted practice unless, given the nature of the market, the behaviour of the firms concerned cannot be explained other than by concerted behaviour. In any case, many prosecuted cartels have involved agreement.

There is no prosecuted case in South Africa involving blockchain or algorithmic collusion.

However there are two ongoing investigations involving the use of digital instruments by companies in the allocation of work. These are referred to here as the 'Bluspec cases' and the 'Glass case'.

- The Bluspec investigation looks at the potential for market allocation downstream where the vertically integrated company, Bluspec, competes with other players who happen to be subscribers to its upstream software. The software concerned could be using algorithms to allocate work. [allegation]
- The Glass case looks at the use of algorithms (Digi Call Administration centers) to fix prices and facilitate collusion between two autoglass fitment companies.

At the time of writing these investigations by the Competition Commission are very new ;hence there is nothing further to report at this stage.

16.6.2. Abuse of dominance

Section 7 of the Competition Act provides the threshold inquiry for establishing the existence of a dominant firm : It provides: A firm is dominant in a market if –(a) it has at least 45% of that market;(b) it has at least 35%, but less than 45%, of that market, unless it can show that it does not have market power; or(c) it has less than 35% of that market, but has market power .Market power is defined in the Act as follows: e power of a firm to control prices, or to exclude competition or to behave to an appreciable extent independently of its competitors , customers or suppliers.

Section 8 provides for the various abuses of dominance .There is a clear provision in respect of excessive pricing . The South African regime for excessive pricing adapted the test in United Brands. However following the decision of the Competition Appeal Court in Sasol Chemical Industries Ltd v The Competition Commission 2015(5)SA471(CAC) where the Commission failed to prove its case based upon the United Brands type test the law was amended in 2018. While it remains a case of abuse of dominance for a dominant firm to charge an excessive price for a good or service , the amendment has changes the test as is shown by way of the following change to s8 of the Act : If there is a prima facie case of abuse of dominance because the dominant firm charged an excessive price, the dominant firm must show that the price was reasonable. Any person determining whether a price is an excessive price must determine if that price is higher than a competitive price and whether such difference is unreasonable, determined by taking into account all relevant factors, which may include—(a)the respondent's price-cost margin, internal rate of return, return on capital invested or profit history;(b)the respondent's prices for the goods or services—(i) in markets in which there are competing products;(ii) to customers in other geographic markets;(iii) for similar products in other markets; and(iv) historically;(c)relevant comparator firm's prices and level of profits for the goods or services in a competitive market for those goods or services;(d)the length of time the prices have been charged at that level;(e)the structural characteristics of the relevant market, including the extent of the respondent's market share, the degree of contestability of the market, barriers to entry and past or current advantage that is not due to the respondent's own commercial efficiency or investment, such as direct or indirect state support for a firm or firms in the market .There have been no cases dealing with excessive pricing within the context of the digital economy.

There is provision for an essential facility doctrine .S8(b) of the Act provides therefor .An essential facility is defined thus essential facility' means an infrastructure or resource that cannot reasonably be duplicated, and without access to which competitors cannot reasonably provide goods or services to their customers;. There has been reference to this doctrine as set out in the description of case law although it has played no significant role in any case which has been litigated to completion.

There are provisions dealing with exclusionary practices, which is defined thus: an act that impedes or prevents a firm entering into, or expanding within, a market. As is illustrated in the case section, this doctrine has been employed in the digital sector.

16.6.3. Mergers

Apart from a specific public interest provision which has not played a significant role with regard to mergers, the provision dealing with mergers has its pedigree in the EU legislation: To the extent relevant it reads thus:

(1) Whenever required to consider a merger, the Competition Commission or Competition Tribunal must initially determine whether or not the merger is likely to substantially prevent or lessen competition, by assessing the factors set out in subsection (2), and –(a) if it appears that the merger is likely to substantially prevent or lessen competition, then determine –(i) whether or not the merger is likely to result in any technological, efficiency or other pro-competitive gain which will be greater than, and off-set, the effects of any prevention or lessening of competition, that may result or is likely to result from the merger, and would not likely be obtained if the merger is prevented; and (ii) whether the merger can or cannot be justified on substantial public interest grounds by assessing the factors set out in subsection (3); or (b) otherwise, determine whether the merger can or cannot be justified on substantial public interest grounds by assessing the factors set out in subsection (3).

(2) When determining whether or not a merger is likely to substantially prevent or lessen competition, the Competition Commission or Competition Tribunal must assess the strength of competition in the relevant market, and the probability that the firms in the market after the merger will behave competitively or co-operatively, taking into account any factor that is relevant to competition in that market, including –(a) the actual and potential level of import competition in the market; (b) the ease of entry into the market, including tariff and regulatory barriers; (c) the level and trends of concentration, and history of collusion, in the market; (d) the degree of countervailing power in the market; (e) the dynamic characteristics of the market, including growth, innovation, and product differentiation; (f) the nature and extent of vertical integration in the market; (g) whether the business or part of the business of a party to the merger or proposed merger has failed or is likely to fail; and (h) whether the merger will result in the removal of an effective competitor.

(3) When determining whether a merger can or cannot be justified on public interest grounds, the Competition Commission or the Competition Tribunal must consider the effect that the merger will have on –(a) a particular industrial sector or region; (b) employment; (c) the ability of small businesses, or firms controlled or owned by historically disadvantaged persons, to become competitive; and (d) the

ability of national industries to compete in inter-national mark.

The following cases concerned merger case law .

a. Takealot/Kalahari (2015)

This merger involved two of the largest online retailers in South Africa. The Commission approved the proposed merger whereby Takealot Online (Pty) Ltd intended to acquire Kalahari.com with conditions related to public interest (employment). There was a horizontal overlap in relation to online retailing of consumer goods and products. Combined market shares were high, however, upon assessing customer purchasing patterns *at the time*, the Commission found that brick and mortar retailers constrain online retailers to a great extent and more so, *at the time*, most of the customers were once-off purchasers. The merger raised public interest concerns in respect of employment. To address the employment concerns, the Commission imposed a condition that no more than 200 employees will be retrenched as a result of the merger and that a training/re-skilling fund be established to support any retrenched employees.

b. Microsoft/LinkedIn (2016)

This was a global merger in digital markets, particularly social networking and off-premise (cloud) services. In South Africa, much of the focus was on whether there could be any exclusionary conduct by Microsoft especially on off premise services (cloud). The investigation revealed there were unlikely to be incentives for such as strategy. Issues relating to big data arose in other jurisdictions especially in Europe, but the merger was approved unconditionally because both Microsoft and LinkedIn generate relatively low revenues in South Africa.

c. Facebook/WhatsApp (2015)

The transaction was not notifiable in South Africa because WhatsApp did not generate any revenue in the country. The merger raised some issues relating to big data globally.

d. MIH / Autotrader (2017)

MIH is part of Naspers, South Africa's largest e-commerce and advertising platform provider. MIH acquired Autotrader, a specialist classified online vehicle advertising platform. The investigation revealed that whilst the merged entity would command a significant market share post-merger and that barriers to entry were high, the merged entity would continue to face constraints from several credible providers of online automotive advertising platforms. Moreover, it appeared that customers exercised appreciable countervailing power in that they could negotiate pricing and could easily switch from one service provider to another. The merger was approved unconditionally.

e. MIH (Naspers)/We Buy Cars (Prohibition)

The Commission has recommended to Competition Tribunal (Tribunal) that the proposed acquisition of WeBuyCars (Pty) Ltd (WeBuyCars) by MIH eCommerce Holdings (Pty) Ltd (MIH), an entity of the Naspers Group, be prohibited. MIH is to acquire 60% of WeBuyCars. MIH is mainly an investment holding company and does not itself supply any products or services in South Africa. It has investments in OLX and the Naspers' subsidiary, Car Trader, which operates as AutoTrader. Although the Commission found that the proposed transaction does not present any competitor (horizontal) overlap in South Africa as the Naspers Group is not active in the buying and selling of cars, it found that the Naspers Group through Frontier Car Group Inc (FCG) has been anticipating entering the South African market for the wholesale and online buying of used cars in competition with WeBuyCars. These entry plans were thwarted directly as a result of the merger.

Given this potential entry, the Commission assessed if the proposed merger will result in the removal of potential competition in South Africa as Naspers Group had plans to enter the South Africa niche wholesale buying of used car market segment utilising the instant cash model and, in so doing, compete directly against WeBuyCars. The Commission also notes that there is a vertical (supplier-customer relationship) overlap because Naspers Group owns and operates online classified automotive advertising platforms, e.g OLX and Auto Trader, and WeBuyCars utilises these platforms to either sell or purchase vehicles. Given the supplier-customer relationship overlap, the Commission considered whether the merger will result in the exclusion of the competitors of WeBuyCars and or AutoTrader. With respect to the removal of potential competition concern, the Commission is of view that the proposed transaction will result in the removal of Naspers Group (FCG) as a potential effective competitor to WeBuyCars in the niche segment of wholesale and online buying of used cars using an instant cash model from the public and the consequent selling to dealers and others. This is the market segment that is currently dominated by WeBuyCars.

Further, the proposed merger will likely result in a substantial lessening of competition through exclusion. With respect to exclusion, the Commission found that there are numerous ways in which Naspers can harness the complementarities between WeBuyCars and AutoTrader and/or OLX to the exclusion of effective competition against WeBuyCars' rivals as well as other online platforms. WeBuyCars is a large and dominant wholesale and online buyer of used cars from the public. On the other hand, AutoTrader is the largest online classified platform and generates significant customer traffic such that it is a key and important online platform for traditional used car dealers seeking to sell their car stock. Thus, it is the view of the Commission that the merged entity will have the ability to leverage its significant AutoTrader position as well as the OLX platform to exclude rivals of WeBuyCars.

Furthermore, the Commission finds that WeBuyCars will likely entrench its dominant position in the purchasing of used cars side, which dominance will also likely translate into dominance on the sell-side since if WeBuyCars can dominate the second hand cars stock in the market.

In addition, Naspers' platforms namely OLX and AutoTrader are likely to further entrench their respective positions in on-line advertising.

The Commission is concerned that the proposed merger would result in the foreclosure of other traditional dealers, that is, rivals of WeBuyCars on the sell side. This is because AutoTrader is a significant platform on which many traditional dealers advertise their cars and has the ability and incentive to offer preferential treatment towards WeBuyCars. Overall, the proposed transaction is likely to substantially prevent or lessen competition in the relevant markets and result in used car customers paying higher prices in future than they would otherwise pay in a competitive environment.

16.7. Conclusion

In July 2019 the Competition Commission reflected on the current position regarding the digital economy and the regulatory framework. It concluded with a number of accurate assessments.

On merger control there is a concern that significant acquisitions of start up companies may not trigger the usual thresholds for merger notification given that these are typically turnover, or asset based. For instance, Facebook/WhatsApp (2015) was not notifiable in South Africa because WhatsApp did not generate any revenue in the country. While South Africa does have the power to investigate small mergers even after they have been completed, these do not need to be notified to the authorities and thus this may raise additional challenge in dynamic digital markets.

On market conduct, the expert report for the EU on competition law in digital markets raises the point that for dominant digital firms there might need to be a reverse onus for them to demonstrate why certain conduct is net efficiency enhancing and not restrictive of new entry. This is not the case currently in South African law as it is incumbent upon the authority to demonstrate exclusionary practices.

Concerns have also been raised across a number of sectors about the fact that the current regulatory framework does not apply to new, disruptive technology, which gives these firms an unfair competitive advantage over regulated incumbents. For instance, the current regulatory framework for land transport in South Africa does not specifically cater for e-hailing firms. Traditional metered taxis have raised the concern that area restrictions and price regulation applied to their business model is not applied to e-hailing firms, placing the traditional model at a competitive disadvantage. Similar concerns have been raised by broadcasters where streaming services such as Netflix are not subject to local content requirements and local procurement practices.

A further area of unfair competition relates to the taxation regime that domestic firms are subject to relative to global digital firms. Whilst this issue is not necessarily new as multinational taxation has been the subject of tax reforms and developments in transfer pricing, the digital economy has thrown up new challenges. In particular, where firms are located abroad, and the sales transaction occurs online with no physical movement

of goods. This situation also permits digital firms to exploit tax havens to lower their overall tax rate, enabling them to out-compete domestic digital rivals too.

The Commission noted that these types of challenges indicate that a process of regulatory review is required if South Africa is to catch up with the shifts to the digital age. Some of these reviews are already underway, such as changes to tax laws as well as the National Land Transport Act. Whilst the answer in some cases may be to bring the digital firms under the same regulatory regime (e.g. in taxation), in other cases the shifts have revealed the inadequacy of the current regulatory regime and the need to move to a relaxation in regulation (e.g. metered taxis). The Commission concluded that this review needs to be a thoughtful process and one which should not be hastily undertaken.

Annex 1: ZA Cases Index

Case No.	The name of the case/parties	Year of the case	Date (month and day) (if available)	Name of the authority adopting the decision	Type of the authority adopting the decision	First instance or appeal	Industry(ies) affected / sector of activity (products) (NACE codes) It may be more than one in each case	level(s) of the digital value chain involved	Type of infringement investigated (for antitrust cases)	Reasons for opening proceedings (for antitrust cases only). Annex I^{4020*}: Private Governance of Digital Platforms: Case Studies

**Klaas Hendrik Heller, Tobias Kleinschmit, Ekaterina Perevoshchikova,
Ekaterina Semenova, Daria Kotova, Thomas Blozovski,
Bowen Wang & Peking University e-Commerce Centre**

1.1. Google/Alphabet^{4021*}

1.1.1. Nature of the competitive game

The search engine is probably Google's most well-known product and can be seen as the foundation of the company's ecosystem. Google achieved the leading market position in the global search engine market around a year after the search service left the testing phase in 1999 and maintained this position since then. Google uses its bottleneck position in the digital business to establish its services and products in many other business fields. This may happen on a technological way, e.g. by interlocking various Google services such as Google Maps, Google Mail or Google Shopping with the Google Search interface. But the Google search engine and the data it collects are also an essential part of Google Ads, through which Google generates about 85% of its revenue. Google has been selling advertisements associated with search keywords since 2000 (even though the founders originally opposed this idea). The revenue generated by the advertisement section allows Google to penetrate new markets by acquiring companies, talents and innovative products. Alike other digital platform markets Google's dominant market position is consolidated by network effects, which make it extremely hard for other companies to penetrate the search engine market and thus challenge Google's bottleneck position.

1.1.1.1. Corporate Organisation Data

While the name Google is still widely used to describe the entire company, the Google LLC has been a subsidiary of the Alphabet Inc. since corporate restructuring that took place in 2015. This case study will explore the complex corporate structure of the Alphabet Inc. to provide a better understanding of Google's position as Alphabet's core business within its organizational framework.

4020 * This is an Annex for Chapter 3.

4021 * Tobias Kleinschmit.

The Legal Structure of Alphabet Inc. After the Reorganization in 2015

In August 2015, the Google Inc. announced plans to create the Alphabet Inc. as a new public holding company.⁴⁰²² The implementation of this holding company took place in October 2015, when the Maple Technologies Inc. (Merger Sub), a direct wholly owned subsidiary of Alphabet and an indirect, wholly owned subsidiary of Google was merged with the Google Inc., with Google surviving as a direct, wholly owned subsidiary of Alphabet.⁴⁰²³ Shares issued and outstanding prior to the reorganization were automatically converted into a corresponding share of Alphabet stock with equivalent attributes.⁴⁰²⁴ The corporate reorganization was completed in 2017, when Alphabet inserted the XXVI Holdings Inc. into the vertical ownership chain by transferring ownership of Google to XXVI Holdings.⁴⁰²⁵ Thereafter, Google was converted from a corporation into a limited liability company, the Google LLC.⁴⁰²⁶ Under the new corporate organization, the Google business includes Search, Ads, Maps, YouTube, Android, Google for Work, Apps for Work and the related technical infrastructure while the other businesses are legally separated and managed independently from the Google businesses.

Sibling Companies and Fields of Activity

As aforementioned, the 2015-2017 restructuring process has led to the transformation of many former Google subsidiaries into independently managed indirect Alphabet subsidiaries. These companies, often referred to as the *other bets*, are active in a variety of business fields distinct from the original Google business. Alphabets subsidiaries include Calico, Chronicle, Dandelion, DeepMind, GV, Capital G, X, Google Fiber, Jigsaw, Sidewalk Labs, Verily, Waymo, Wing, Loon and Makani. As the Holding Company of these *other bets*, the XXVI Holdings Inc. is not obliged to disclose its subsidiaries, this list may be incomplete. The following section will touch upon the companies' business models and point towards potential interlocks with the core business of Google.

The Calico LLC is a research and development entity investigating technologies that aim to increase the human life span.⁴⁰²⁷ It was founded in September 2013. Calico has not produced any known medical or biotechnological products as of 2018.⁴⁰²⁸ The LLC holds research partnerships with several pharmaceutical companies, organisations and

4028 B. Womack, Google Creates New Company Called Alphabet, Restructures Stock (August 10, 2015), available at <https://www.bloomberg.com/news/articles/2015-08-10/google-to-adopt-new-holding-structure-under-name-alphabet->

university research units, including the AbbVie Inc., the 2M LLC, The University of Texas Southwestern Medical Center, The Broad Institute of MIT and Harvard, and QB3 (which belongs to the University of California).

The Chronical LLC was originally a project launched by Alphabet's moonshot factory X in 2016 and became an independent company in 2018. Chronical is composed out of a cybersecurity intelligence and analytics platform and VirusTotal, which is a company that develops malware intelligence software and that was acquired by Google in 2012.⁴⁰²⁹

The Dandelion Energy Inc. offers geothermal heating and cooling systems to private homeowners.⁴⁰³⁰ Like Chronical, Dandelion has been a research project of the research lab X until it became an independent company in 2017.⁴⁰³¹

DeepMind Technologies Ltd. is an artificial intelligence firm that develops advanced algorithms capable of machine learning. The company was founded in 2010 and has been acquired by Google in 2014.⁴⁰³² Facebook unsuccessfully attempted to acquire the company in 2012 according to reports.⁴⁰³³ The company was held to be one of Google's main competitors in the area of artificial intelligence. Allegedly, Larry Page has led the acquisitions negotiations himself. DeepMind developed a neural network that mimics human behavior in playing (video) games and made headlines after beating the world champion in Go in 2016. It has thereafter turned to other research field, such as protein structure prediction (AlphaFold)⁴⁰³⁴ and neural networks for generating human-like voices by waveform modeling (WaveNet). WaveNet has been used in the Google Assistant and Google's text-to-speech product Cloud Text-to Speech.⁴⁰³⁵ The Algorithm has furthermore been used to the personalized app recommendations of Google Play⁴⁰³⁶ and the energy conserving Android Pie features Adaptive Battery and Adaptive Brightness.⁴⁰³⁷ DeepMind technologies have also been used in the health sector. In corporation with the NHS, the company developed programs that analyze medical data and warn medical staff about changes and alerting information in this data.⁴⁰³⁸ A data-sharing agreement

between DeepMind and the Royal Free London NHS Foundation Trust has been subject to wide criticism, as DeepMind obtained sensitive medical data about an estimated 1.6 million patient treated in hospitals run by the trust.⁴⁰³⁹ Other health related features concentrate on the analysis of body scans for potential diseases or cancerous cells.⁴⁰⁴⁰

- **The GV Management Company LLC (respectively the GV UK Management Company Ltd)** is Alphabet's venture capital investment subsidiary, which was founded as Google Ventures in 2009. GV provides venture capital and operational support in design and product management, marketing, engineering and recruiting.⁴⁰⁴¹ GV claims to have invested in over 350 companies including competitors such as Uber, with \$3.4 billion under management.⁴⁰⁴²
- **The CapitalG Management Company LLC** is a private equity firm that was founded as Google Capital in 2013.⁴⁰⁴³ Capital G provides growth capital to technology companies and is allegedly return-driven.⁴⁰⁴⁴ Like Alphabet's Venture Capital arm, the support is not solely financial, but comes along with operational support by Alphabet.⁴⁰⁴⁵ A complete list of investments is available on the CapitalG webpage.⁴⁰⁴⁶
- **The X Development LLC** is Alphabet's research and development facility. The company was founded in 2010 and operates several early stage research projects of Alphabet, of which many remain undisclosed. As aforementioned, a number of Alphabet's now independent subsidiaries have started as projects of X, including Waymo, Dandelion, Loon, Wing, Makani.
- **The Google Fiber Inc.** provides fiber-to-the-premises services in form of broadband internet and IPTV to a number of cities in the United States. It is part of Alphabet's access division, which also includes OneHub, Project Link, RailTel Partnership, Project Sunroof and Project Titan. As Google's business remains focused on digital services, Fiber has been described as an attempt to coerce existing internet providers to improve the internet speed by exercising competitive pressure.⁴⁰⁴⁷
- **Jigsaw** was founded as *Google Ideas* in 2010 and develops cyber security solutions. Among Jigsaw projects is *Perspective*, a learning algorithm identifying toxic comments on platforms, which is used by the Guardian, the Economist, the New

York Times and Wikipedia.⁴⁰⁴⁸ This software could be of high interest to important competitors in the digital business field such as Facebook and Twitter. Jigsaw furthermore includes an anti-distributed-denial-of-service (DDoS) software (*Project Shield*), the VPN tool *Outline* as well as a number of other cybersecurity and anti-cybercrime services.

- The **Sidewalk Labs LLC** was founded in 2015. The company is active in the field of urban planning and city infrastructure, advancing the concept of smart cities. Sidewalk Labs' focus lies on self-driving technology and digital navigation tools as well as low-cost and low-space real estate solutions. The Sidewalk Labs have launched the project Sidewalk Toronto in corporation with municipal and government entities, which aims to create a model of the smart city in an area of Toronto. Wake-bayashi
- The **Verily LLC** was founded as the *Google Life Sciences* division of X and became an independent company in 2015. Verily is active in research and development of biotechnology. It's projects include the Baseline study, in which verily collected genetic material to create a picture of a healthy human, surgical robotics and smart contact lenses. It has formed cooperations with different companies such as Johnson & Johnson, GlaxoSmithKline and Dexcom.
- The **Waymo LCC** was a project by X and became an independent subsidiary of Google in 2016. The company develops self-driving technology and is competing with companies such as Tesla, Uber and Navya.
- The **Wing LCC** was an X project until it became an independent company in 2018. The company develops delivery drones. Wing started with test deliveries in January 2019 and received an Air operator certificate from the FAA to operate as an airline in the US as the first drone delivery company in April 2019.⁴⁰⁴⁹
- The **Loon LLC** was an X project that worked on possibilities to provide internet access to remote areas by using high altitude balloons. It became an independent company in July 2018. This technology has been used to provide internet access in Puerto Rico after the system had been taken down by an hurricane in 2017.
- **The Makani Technologies LLC** develops airborne (i.e. towerless) wind turbines. Google had funded Makani since 2007, before the company was acquired and integrated into X in 2013.⁴⁰⁵⁰ Makani became an independent company in February 2019.

4050 <https://makanipower.com>

- The **Malta Inc.** has been an X project that became an independent company in December 2018.⁴⁰⁵¹ Malta develops technologies to store electricity as heat in high temperature molten salt.

Shareholding Structure

Alphabet's stocks are separated into three different classes that come along with different voting rights. Class C stock is traded under GOOG and does not have any voting power. Class A stock is traded under GOOGL and each share entitles the owner to one vote on director nominees and proposals to be voted on. Class B stock is not traded on the public market and is owned by company insiders. Each share of Class B stock is entitled to ten votes on director nominees and proposals to be voted on. As of April 22, 2019, there were 299,436,023 shares of Alphabet's Class A common stock outstanding, 46,544,284 shares of Alphabet's Class B common stock outstanding, and 348,263,508 shares of Alphabet's Class C capital stock outstanding.⁴⁰⁵² 95% of Class B stock is held by Executive Directors and Officers of the Alphabet Inc., which grants them 58,2% of total voting power. Larry Page and Sergey Brin alone hold enough class B stock to maintain 51% of total voting power together.

investors can be found with some of the biggest competitors, such as Facebook⁴⁰⁵⁵ and Amazon⁴⁰⁵⁶.

1.1.1.2. Interlocking Directorates

The board of directors of the Google LLC is currently composed of 10 members: Larry Page, Sergey Brin, John L. Hennessy, L. John Doerr, Roger W. Ferguson, Jr., Ann Mather, Alan R. Mulally, Sundar Pichai, Eric E. Schmidt, K. Ram Shriram.⁴⁰⁵⁷ The directorate of the Alphabet Inc. is composed of the same 10 members plus Diane B. Greene, forming a 11 member directorate.⁴⁰⁵⁸ Alphabet and respectively Google have been subject to investigations by competition authorities, most prominently leading to the departure of Eric E. Smith from the Apple Board of Directors and recently to Alphabet's CLO David Drummond leaving the board of directors of Uber.⁴⁰⁵⁹

- **L. John Doerr III** is member of the board of directors of the Investment Arm of New Schools Venture Fund, Segway Inc., MiaSolé Inc., Zazzle Inc., Himax Display Inc., Ogini Inc., Renmatic Inc., Lockerz Photos, Next Autoworks Company, Flipboard Inc, Essence Group Holdings Corporation, Lumeris Inc., Erly Inc., Coursera Inc., True Software Scandinavia AB, Tradesy Inc, Shyp Inc, Flipagram Inc, BetterWorks Systems Inc, Nescape Communications Corporation, Bloom Energy Corporation, Amyris Inc, MyFitnessPal Inc., Remind101 Inc.⁴⁰⁶⁰ Doerr had left the Amazon board in 2010, allegedly because the FTC has investigated possible anticompetitive ties between Google and Amazon.⁴⁰⁶¹
- **Roger W. Ferguson** is member of the board of directors at the International Flavors & Fragrances Inc. and General Mills, Inc.⁴⁰⁶²
- **Ann Mather** has been a member of Googles board of directors since 2005. She is furthermore director at Netflix, GluMobile, Shutterly, MGM Holdings, Airbnb⁴⁰⁶³ and Arista Networks. Mathers directorate at Netflix seems an interesting fact to investigate, as Alphabets Youtube has joined the streaming segment and is therefore a direct competitor of Netflix.

- **Alan R. Mulally** is Independent director at Carbon Inc.⁴⁰⁶⁴
- **Eric E. Schmidt** is currently director at Civic Analytics and non-executive director at the economist group limited.⁴⁰⁶⁵ He is furthermore Chairman of Alphabet's GV. Smith has left Apple's board in 2009, after the SEC started investigations of possible infringements of competition regulations.⁴⁰⁶⁶
- **K. Ram Shriram** is director of Plaxo Inc., [24]7.ai, Inc., Business Signatures Corporation, MEVIO, Inc., OnHealth Network Company and Zazzle Inc.⁴⁰⁶⁷
- **Larry Page, Sergey Brin, Sundar Pichai, John L. Hennessy and Diane B. Greene** are not known to hold any executive positions in other companies.

1.1.2. Corporate Growth Strategy: Business Models and Ecosystems

Google's Growth Strategy has been described as *semi-organic*, which means that "revenue results from products or services that emerge when acquired technology-related assets attach to a company's existing capabilities in a complementary manner."⁴⁰⁶⁸ Complementary businesses show a sufficient degree of similarity to generate efficiencies of scale and scope while also creating value from "differences that are mutually supportive enhancement-based synergies".⁴⁰⁶⁹

Google Inc. respectively Alphabet Inc. have acquired roughly 170 companies since 2010. In each of its most acquisitive years 2011 and 2014, Google has acquired 34 companies.⁴⁰⁷⁰ The biggest acquisitions in order of volume have been Motorola Mobility in 2010 (\$12.5 billion), Nest Labs in 2014 (\$3.2 billion), DoubleClick in 2008 (\$3.1 billion), Youtube in 2006 (\$1.65 billion) and Waze (\$996 million).⁴⁰⁷¹ Some of Google's most valuable products and services such as Android, Docs, Analytics and Maps are rooted in acquisitions.⁴⁰⁷²

The company's mentality towards M&A was described as a *failure is a feature* mentality, with some acquisitions in highly experimental areas like the Makani Technologies LLC deal that was described above.⁴⁰⁷³ While investment in experimental business fields

4073 G. Geis, *Semi-Organic Growth – Tactics and Strategies behind Google's success*, Weinheim, Wiley, 2015, p.105.

traditionally comes along with a higher risk of failure, a number of M&A transactions did not end up being successful for different reasons. In 2006 Google acquired dMarc Broadcasting, a company developing technology to auction radio ad slots, to extent it's advertising network to Audio Ads. This advertising branch was shut down in 2009 after the company faced problems in building the required technology and getting stations to implement it. The microblogging service Jaiku, that was acquired by Google in 2007 was shut down in 2011 because it proved to be unable to compete against the dominant Twitter. Other failed acquisitions include the social search service Aardvark, the photo editing and sharing software Picnic, Slide, TalkBin, dailyDeal and Zagat Survey. Google's most controversial and largest acquisition was Motorola Mobility, with many commentators raising concerns about potential damage to the Android ecosystem by entering the OEM market as a competitor, which may lead to other OEM producers opting for other operating systems.⁴⁰⁷⁴

Another goal Google pursues in its acquisition strategy is the recruitment of talent. According to an article in the Times, at least 221 startup founders were hired after acquisitions between 2006 and 2014.⁴⁰⁷⁵ By 2015, two thirds of them were still with the company.⁴⁰⁷⁶ Google encourages founders to stick with the company by paying stay boni or using golden handcuffs, i.e. compensation that can only be cashed in after a certain time of employment with the company.⁴⁰⁷⁷ Some of the transactions have been labeled *acqui-hire*, because they simply aimed at integrating the targets team into existing Google teams while shutting down the companies original product.⁴⁰⁷⁸ This may be an explanation for the geographic focus of Alphabet acquisitions, with 60% of targets being California-based.⁴⁰⁷⁹

Internal Growth is furthermore pursued by Alphabet's „moonshot“ factory X. Many now independent subsidiaries of Alphabet / Google started as projects of X (see above).

1.1.2.1. Google

The Google LLC can be considered as Alphabet's core business. Googles flagship service is the search engine, but Youtube, Maps, Android, DeepMind, Google Shopping and Googles Advertising Services are equally Google divisions. The latest company to join has been Nest Labs Inc., which was merged into a Google subsidiary called Google Nest in February 2018.⁴⁰⁸⁰ Googles describes it's business model as being “based on the inter-

action between the online products it offers for free and its online advertising services from which it generates the main sources of its revenue".⁴⁰⁸¹ The next pages will shed light on the value chain in this business model by exploring three Google products: Android, Google Shopping and Google Advertising.

1.1.2.1.1. Google Advertising

Google develops and maintains an online advertising platform, in which advertisers pay for the display of advertisement in the Google network as well as on third-party-web-pages. Advertising is Google's (and Alphabets) core business. 85% of Alphabet's total revenue has been created from advertising in 2018.⁴⁰⁸²

1.1.2.1.2. Business Model and Ecosystem

The advertising system is based on keywords that are set by advertisers and on cookies. Advertisements can be placed among the general search results of Google's search engine or on third-party webpages that have a keyword-relevant content (the latter service is called AdSense). When a user clicks on the advertisement and gets redirected to the advertisers webpage or products or services, Google receives a payment by the advertiser. If the advertisement is placed on partner website, the partner receives a part of the revenue. The technology is available for Mobile Devices under the name AdMob and for in-game advertising under AdScape. Information provided by Google Analytics (Google's webtracking services) is used to determine good ad placements.

For displaying ads with AdSense for content, publishers receive 68% of the revenue recognized by Google in connection with the service. For AdSense for search, publishers receive 51% of the revenue recognized by Google. These percentages are consistent, regardless of a publisher's geographic location, and are not averaged between publishers.⁴⁰⁸³ The advertising slots (this includes the slots for the price comparison service Google Shopping) are sold in a bidding process, in which the price is determined based on the keywords, the quality ranking of the advertiser and the competitors. The average cost per click in Google Ads is between \$1 and \$2 per click.⁴⁰⁸⁴

1.1.2.1.1. Structure of the Industry

The global digital advertising market is dominated by Google (including YouTube) with a market share of 32,3% and Facebook (including Instagram) with a market share of 18,7%. Other market players are Alibaba with 9,2%, Baidu with 4,5%, Tencent with 4,9%, Microsoft with 3,5%, Yahoo with 1,1%, Amazon with 1%, Twitter with 0,9% and Snapchat

4084 <https://www.wordstream.com/blog/ws/2015/05/21/how-much-does-adwords-cost>

with 1,1% (see Graphic below). One should, however, keep in mind that the market shares of Alibaba, Baidu and Tencent are a result of their dominance on the Chinese digital advertising market, from which Google and Facebook are widely excluded due to the governments censorship. Google holds an estimated 80,2% of the Search Ad Revenues in the US with no other competitor holding more than 10% of total revenue. It has been announced in March 2019 that the British Competition Authority CMA will investigate the digital advertising market for potential restrictions of competition.⁴⁰⁸⁵

1.1.2.2. Android

Android is an operating system for (touchscreen) mobile devices. The software was originally developed by Android Inc., which was acquired by Google in 2005. The first commercial device that used the operating system was the HTC Dream, which was released in 2008. Versions of android are also used in Wear OS (smartwatches), Android Auto (automobiles), Android TV (TVs).

1.1.2.2.1. Structure of the Industry

Since its acquisition, Android has become the dominant operating system for mobile devices. Android has a market share of around 86% for smartphone being sold in 2018, while the largest competing system iOS has a share of around 14%. Microsoft stopped to work on its Windows 10 Mobile (the successor of the Windows Phone) in 2017 after it was unable to penetrate the market.⁴⁰⁸⁶ Support for the system was announced to be shut down in December 2019 with remaining users being instructed to migrate to iOS or Android.⁴⁰⁸⁷ Blackberry abandoned its own operating system BlackBerry 10 (the successor of BlackBerry OS) in favor of the Android system in 2017. Support for BlackBerry 10 and OS devices will be shut down in the end of 2019. Nokia stopped releasing Smartphones run on its operating system Symbian in 2012.⁴⁰⁸⁸ There are a couple of (mostly open source) operating systems such as Tizen, Plasma Mobile and Librem, but none of them has a relevant market share. There are some regional anomalies to this general dominance of Android and iOS. The operating system Kai OS allegedly captured a market share of 16% in India, overtaking iOS and ranking second after Android.⁴⁰⁸⁹ The global market share of KaiOS, however, remains below 1%.

4088 C. Marshall: From birth to death: why Nokia's Symbian was the future of mobile tech (January 27, 2013), available at <https://www.techradar.com/news/software/operating-systems/from-birth-to-death-why-nokia-s-symbian-was-the-future-of-mobile-tech-1127653>.

4089 S. Hariharan: OS that makes 'dumb phones' smart takes on Android, Apple (April 29, 2019), available at <https://economictimes.indiatimes.com/small-biz/startups/newsbuzz/os-that-makes-dumb-phones-smart-takes-on-android-ap>

Google has invested \$22 million in KaiOS in 2018 and subsequently cooperated with KaiOS to make Google services like Maps, Youtube and Google Search available for the system.⁴⁰⁹⁰ Nokia has launched a KaiOS-based smartphone in 2018.⁴⁰⁹¹ Another regional specificity can be found in China, where the Android market share of around 75% is below the worldwide average, which is why the European Commission held China to be the only country where Android is not the dominant mobile operating system.⁴⁰⁹²

One should, however, keep in mind that iOS is exclusively used by vertically integrated developers. This is why the European Commission assumed that iOS is not part of the same market because it is not available for license by third-party manufacturers.⁴⁰⁹³ The market share of Android in the market for licensable smart mobile operating systems was held to be over 95% by the Commission but can be held to be close to a 100% considering the market shares elaborated above. The Commission has fined Google €4.34 billion for imposing “illegal restrictions on Android device manufacturers and mobile network operators to cement its dominant position in general internet search” in 2018.⁴⁰⁹⁴

1.1.2.2.2. Business Model

Even though Google has continued to develop Android since the acquisition, the software was kept open access.⁴⁰⁹⁵ Third parties can download, use and modify the source code free of charge.⁴⁰⁹⁶ This does however not include the *Google Mobile Services* (GMS) such as Gmail, Google Maps or Google Playstore. If device manufacturers wish to install these applications on their devices, they have to enter into a licensing agreement with Google.⁴⁰⁹⁷ This license was originally not paid monetarily but compensated with the agreement to certain restrictions that were beneficial to Google’s dominance in the search market (by tying the GMS to Google search) and in the mobile operating system market (by preventing device manufacturers from producing phones with competing Android forks).⁴⁰⁹⁸ These restrictions have however been declared unlawful by the European Commission in 2018 and resulted in Google being fined €4,34 billion.⁴⁰⁹⁹ Since then Google has announced to change Androids business model to comply with the EC’s decision. While the restrictions will be dropped by Google, it will start charging phone

makers a license fee before being able to install the GMS.⁴¹⁰⁰ These fees will, however, not be the most important source of profits from the Android business. More important is the money that flows from the cut Google takes from app sales on PlayStore and mobile advertising in its own applications such as YouTube, Google Maps, Drive and Gmail among others.

There is no clear and recent data on the profits generated by Android. It was, however, accidentally revealed in a 2016 lawsuit between Oracle and Alphabet, that Alphabet has made \$31 billion in revenue and \$22 billion in profit from Android since its creation.⁴¹⁰¹ This is an amount equivalent to the revenue of Apple's iPhone sales in the Q4 of 2015.⁴¹⁰²

1.1.2.2.3. Ecosystem

Google is a core player in the Android ecosystem, not only as the main developer of the operating system but also as an app developer and device manufacturer.

The device manufacturers form another player in the ecosystem. They use the technology that is generated by the Android ecosystem, including the operating system developed by Google as well as technology produced by other actors in the ecosystem such as app developers. They provide handsets to the ecosystem, i.e. hardware and android compatible software. Google itself had joined the market of device manufacturers by ac-

4100 S: Schechner: Google Will Charge Phone Makers to Pre-Install Apps in Europe (October 16 2018), available at <https://www.wsj.com/articles/google-will-charge-phone-makers-to-pre-install-apps-in-europe-1539707606>.

4102 M. Singleton: Oracle just revealed how much money Google makes from Android (January 21, 2016), available at <https://www.theverge.com/2016/1/21/10810834/android-generated-31-billion-revenue-google-oracle>.

quiring Motorola Mobility in 2012, but ended up selling it off to Lenovo in 2014.⁴¹⁰³ With an estimated revenue \$60 billion in Q4 2017, device manufacturers capture a significantly bigger share of the overall value off the android ecosystem than Google does.⁴¹⁰⁴

Mobile App developers provide user software to the market. In exchange, they either receive direct financial compensation by users or compensation through placing advertising. Mobile App developers also capture growing shares of the revenue generated by the Android ecosystem, with a reported revenue of \$20 billion in 2017.⁴¹⁰⁵

The user base consumes the hardware and software that is provided by the other participants in the ecosystem. While some of this is compensated by money, users also provide their data to the market. It has furthermore been discussed whether users pay services provided to them with their attention to advertising.

1.1.2.3. Google Shopping

Google Shopping is a specialized search service that allows users to compare product offers from different merchant websites.⁴¹⁰⁶ The services was first launched in the US in 2002 as Froogle, later renamed Google Product Search in 2007 before it finally became Google Shopping in 2012.

1.1.2.3.1. Structure of the Industry

The industries relevant to Google Shopping are the market for comparison shopping services and (because of involvement in the business model) the market for general search services.⁴¹⁰⁷ Google holds a dominant position in the general search industry, with a market share of 80,47% for desktop search and 94,87% for mobile search in 2017. The development of Google shopping is held to be a reaction to Amazon's growing relevance as a product search engine. It is difficult to find reliable data on the global market shares of other price comparison services, as most of them are operating in national markets.⁴¹⁰⁸

Source: EC Commission Decision AT.39740 – Google Search (Shopping) ⁴¹⁰⁹

1.1.2.3.2. Business model

Google Shopping has originally been a standalone specialized search services website, which respond to user queries by returning offers from merchant websites, enabling users to compare them.⁴¹¹⁰ When rebranding Froogle in 2007 Google also launched a „One Box” for Google Product Search. Universals or OneBoxes are results from one of Google’s specialist search results that are shown on the general search results pages, mostly above or among the first generic search results. The Product Universal (now: Shopping Unit) shows Google Product Search results, including images, prices and other information on the relevant items. While merchants first did not have to pay to be included in the Product Search, Google changed its business model to a “paid inclusion” model in 2012. Merchants now have to pay when their product is clicked on Google Shopping. The business model was changed in reaction to the Commission’s decision in Google Shopping: Other product comparison platforms are now allowed to participate in an auction process for the advertising spots.⁴¹¹¹ However, a 2018 study has found that over 95% of ads are still placed by Google.⁴¹¹²

1.1.2.3.3. Ecosystem

The ecosystem of Google Shopping is alike the Google Advertising System. Google provides a platform for the matching between merchants and buyers. Google Shopping has a special position in comparison to other price comparison platforms which are often either specialized on certain products (such as flights, flats, cars) or only operate on the national level.

1.1.3. Summary of the Case study

1.1.3.1. Contractual Governance

Exclusivity agreements by Google have been the subject to proceedings before the European Commission in recent years. Google has been bundling 11 different apps with the license to use the Google Play Store. It furthermore used to block phone makers from selling mobile devices that run forked Android versions and paid handset manufacturers to exclusively bundle the Google search app on mobile devices.⁴¹¹³ After the European Commission slapped Alphabet with a record fine for anticompetitive conduct, the company has decided to abandon these practices. It instead start to charge royalties for Google Apps like Maps, GMail and Docs.⁴¹¹⁴

Google furthermore used to make it impossible for competitors to place advertisements on third-party websites by including exclusivity clauses to AdSense contracts. This has equivalently been subject to an investigation by the European Commission and eventually led to a fine of 1.7 billion €.

A major technique to enlarge the value capture in certain ecosystems or penetrate new markets is through acquisitions. This does not only include the acquisition of the hard assets of the acquired companies but foremost the acquisition of talent.

1.1.3.2. Soft or informal governance

Soft and informal governance regimes can be found in all branches of the Alphabet Inc. It is likely that Alphabet exercises influence on third party companies through the support section of the private equity and venture capital branches GV Management Company LLC and CapitalG Management Company LLC. That is to be assumed above all because many portfolio companies are active in similar economic sectors. Similar influence might also be exercised by external institutional investors such as BlackRock and Vanguard, that hold shares in Alphabet as well as in competing companies. In addition, it seems at least not unlikely that the parallel activity of Google directors in other companies in the digital sector will lead to mutual influence.

1.1.3.3. Conclusion

A conclusion that can be drawn from the examples outlined above is that Google's attempts to enlarge its value capture in different ecosystems are subject to increasing scrutiny by competition authorities. Especially the exclusivity agreements for the use of licenses have been subject to several procedures before the European Commission.

4113 R. Browne, J. D'Onfro: EU fines Google \$5 billion over Android antitrust abuse (July 18 2018), available at <https://www.cnbc.com/2018/07/10/eu-hits-alphabet-google-with-android-antitrust-fine.html>.

4114 J. D'Onfro: Google will stop bundling its apps on Android phones in response to EU fine (October 16 2018), available at <https://www.cnbc.com/2018/10/16/google-will-stop-bundling-its-apps-on-android-phones-in-response-to-eu-fine.html>.

While the contractual governance in Google's ecosystems has therefore changed during the last decade, the informal or soft governance as well as acquisitions still allow Google to increase its market share in different business fields. However, several strategic changes in Google's business imply the company is trying to modify its business model to explore new sources of income (such as the licensing of Apps or the creation of a premium segment for Youtube) apart from the classic advertising business.

1.2. Amazon^{4115*}

1.2.1. Nature of the competitive game

The global retail e-commerce market has been growing at an average of 20% since 2014 and projections predict this trend will last at least until 2021.⁴¹¹⁶ In 2017, the retail e-commerce sales worldwide made up 2,3 trillion USD, with projections for 2021 amounting to 4,88 trillion USD. Online shopping combines for 15 % of internet usage, yet the market shows significant regional differences. In China, eg., 19 percent of the total sales volume occurred through the internet, while Japan had a share of only 6.7 percent. Competition among e-commerce businesses has been fierce, since under the influence of sales meta-search engines, the price has become the main differentiator.⁴¹¹⁷ Also, consumer expectation has risen significantly under the influence of market leaders and their benchmark setting the standard for fulfilment, reviews and customer service. Businesses seek to engage in a more-than-transactional relation with clients. It is here that ecommerce platforms develop ecosystems in order to have a deeper integration into users' behaviour and usage patterns (user group, time,...). E-commerce competition centers around consumer attention in an environment of growing distractions ('attention economy')⁴¹¹⁸. Today, e-commerce ecosystems include technology, hardware storage, internet and data services, industrial real estate investment trusts, logistics, and payment services. Amazon, Inc. has gone furthest in multiplying the sales and service markets in which it acts as middleman⁴¹¹⁹, ranging from retail to digital media content, and recently cloud services, health care, and home assistance.

1.1. Amazon's story of growth

Amazon.com, Inc. is a technology company headquartered in Seattle, Washington which operates in the fields of e-commerce, cloud computing, and artificial intelligence. It forms the world's largest e-commerce marketplace and cloud computing platform and

4119 <https://www.brucebnews.com/2018/08/the-amazon-ecosystem-the-company-that-wants-to-sell-everything-to-every-one/>.

is the world's largest Internet company by revenue as well as the second largest employer in the United States. Funded by current CEO Jeff Bezos in 1994, Amazon started as an online bookstore, but quickly broadened its offer and expanded successively into audio and video downloads and streams, software, video games, electronics, apparel, furniture, food, toys and jewelry and is today a full-service retailer.

On Amazon.com, third-party resellers' sales have gone up from 3 % in 1999 to 58 % in 2018.⁴¹²⁰ In this third-party reseller segment, Amazon competes with eg eBay and has tried to outperform competitors by offering superior selling tools which manage inventory, process payments and shipments.

In 2002, Amazon launched Amazon Web Services (AWS), an internet data analytic which provided statistics for marketers and developers. In 2006, AWS expanded its portfolio into cloud computing through the acquisition of services which rent computer processing power and storage space respectively. Likewise in 2006, Amazon started Fulfillment by Amazon which offers individuals and small companies to sell their products through the Amazon website and have shipment administered through Amazon.

In an acquisition that was widely interpreted as an attempt to alter the concept of a retail store, Amazon acquired the US leading organic retail chain, Whole Foods Market, in 2017.

Amazon's products and services today include a vast spectrum integrating into several spheres of economic and personal life, including AmazonFresh, Amazon Prime, Amazon Web Services, Alexa, Appstore, Amazon Drive, Echo, Kindle, Fire tablets, Fire TV, Video, Kindle Store, Music, Music Unlimited, Amazon Digital Game Store, Amazon Studios, and AmazonWireless.

1.2. Corporate subsidiaries

At present, Amazon owns over 40 subsidiaries, including, inter alia, the following:

- **A9.com** is focusing on developing innovative technology.
- **Amazon Maritime, Inc.** is entitled to operate as a non-vessel-owning common carrier and enables the company to proceed shipments from China to the US.
- **Amazon Web Services** (AWS) provides tailored cloud-computing platforms to individuals, companies and governments. These provide a technical infrastructure composed of modularized building blocks and tools, such as Amazon Elastic Compute Cloud, enabling users to have access to a virtual cluster of computers through the Internet. Most of the more than 90 of such services included in AWS's portfolio until 2017 are not directed at end users but programmers and developers through APIs. The AWS services is administered through server farms throughout the world. Its pricing policy is based on the degree of usage, the features chosen and additional aspects of availability, redundancy, security and service. Customers include, inter alia, NASA, the Obama presidential campaign of 2012, Netflix and

⁴¹²⁰ Amazon, Inc. Annual Report 2018, available at <https://ir.aboutamazon.com/static-files/0f9e36b1-7e1e-4b52-be17-145dc9d8b5ec>.

more than 80 % of Germany's listed DAX companies. In 2019, a bigger collaboration with Volkswagen was announced, aiming at a full cloud-based integration of the VW supply chain.⁴¹²¹ While AWS owns 34 % of all clouds (IaaS and PaaS), its largest competitors are Microsoft (11 %), Google (8%) and IBM (6%)⁴¹²².

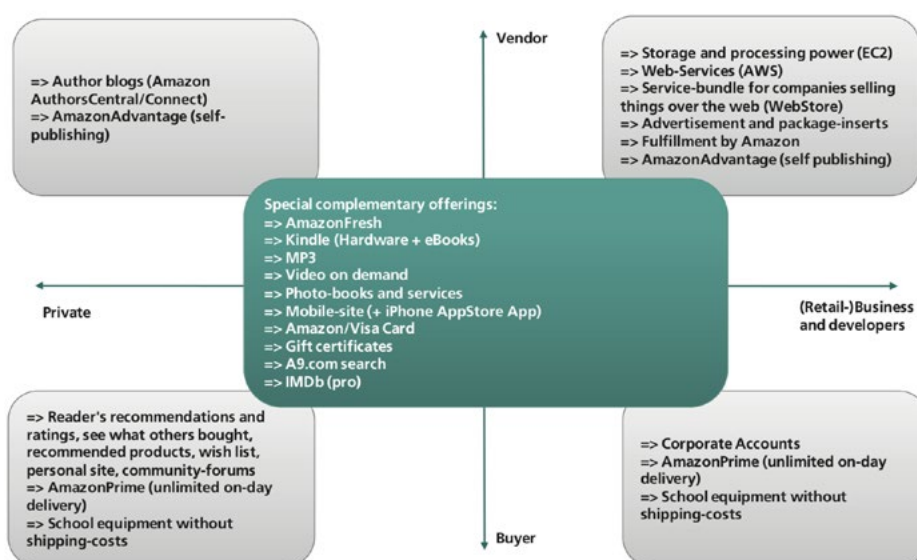

- **Audible.com** produces and distributes spoken audio content, such as entertainment, information and educational programming. Its production branch, Audible Studios, has turned Audible into the world's largest producer of audiobooks on the Internet. Amazon acquired Audible in 2008.
- **Beijing Century Joyo Courier Services** holds a freight forwarding license by the US Maritime Commission and is part of Amazon's attempts to explore innovative logistics concepts including trucking and air freight in order to compete with leading cargo operators such as UPS and FedEx.
- **ComiXology**, acquired in 2014, is a cloud-based digital comics platform which gives access to a selection of more than 40,000 comics and graphic novels on portable devices and via web browser.
- **CreateSpace**, acquired in 2009, provides self-publishing services for independent publishers, film studios, and music labels.
- **Goodreads**, acquired in 2013, functions as a "social cataloging" service that gives users access to user-generated databases of books, annotations, and reviews.
- **Lab126** develops integrated computer hardware such as e-readers and tablets (Kindle), digital media player (Amazon Fire TV), phones (Fire Phone) and voice command devices (Echo).
- **"Project Kuiper"** is a satellite internet constellation working together with satellite ground station facilities (the "AWS Ground Station Unit") in order to provide large broadband internet.
- **Ring** is a smart home company which focusses on WiFi powered smart doorbells alongside other smart devices, eg in home security.
- **Souq.com**, acquired by Amazon in 2017, is the largest e-commerce platform in the Middle East with a base in Dubai.
- **Twitch** is a live streaming platform for video with emphasis on video gaming content, described as the "ESPN of esports".
- **Whole Foods Market** is the largest US organic supermarket chain, acquired by Amazon in 2017.
- **Junglee** is an online shopping service that provides a search within online and offline offers from India, allowing to compare millions of products across various shopping facilities through one interface.

1.2.2. Business Models

Amazon's corporate vision statement posits the aim "to be Earth's most customer-centric company, where customers can find and discover anything they might want to buy online."⁴¹²³ Towards this, Amazon formulates its mission, namely to "strive to offer our customers the lowest possible prices, the best available selection, and the utmost convenience." Pricing, selection and convenience⁴¹²⁴ are achieved through size and a fast-moving business strategy based on technological innovation. Competitors' market prices are used as a basis to set the price of AmazonBasics products. In other fields, Amazon recurs to price discrimination by pricing the same item differently to different consumer groups, ie in the US and UK shop. Hence, adjustments to national market specifics, the respective perceived value of products ("value-based pricing") and consumer preferences become easy to implement.

Source: Weiner/Renner/Kett (2010)⁴¹²⁵

Amazon quickly outgrew its role as a mere online bookstore by the use of technological innovation and a broad range of services targeting different client groups in the aim of ultimately offering "infrastructure as a service". Today, Amazon follows a hybrid business model and disposes of a series of *streams of revenues*, making it less dependent on a specific service and its economic success, trade cycles and regulatory context. For private customers, reader's recommendations and ratings allowed personalized search early on, more recent services such as "One-Click-Buy" and advanced delivery options have made the purchase more convenient. For vendors, Amazon now offers fully-fledged infrastructure online and offline, comprising storage and delivery facilities

4123 <https://www.amazon.jobs/en/principles>.

4124 See specifically on the effects of convenience <https://www.marketplacepulse.com/articles/the-tyranny-of-amazon-convenience>.

4125 N. Weiner/Th. Renner/H. Kett, Geschäftsmodelle im "Internet der Dienste", Fraunhofer IAO, 2010, https://www.digital.iao.fraunhofer.de/content/dam/iao/ikt/de/documents/2010_geschaeftsmodelle_im_idd_aktueller_stand.pdf.

as well as webservices that provide for advertising, processing of sales and logistics. Altogether, Amazon offers a broad and modularized service bundle that allows an easy and comprehensive online store setup without almost any hard- or software requirements for the vendor.

1.2.3. Ecosystem

Through the described product mix, Amazon has early on adopted an integrative ecosystem strategy and today operates a fully-fledged ecosystem that is often seen as prime example of the very concept of “ecosystem”.

A key integrative tool that cross-cuts classical lines of division between product markets is the loyalty program **Amazon Prime**. Initially established in 2005 at an initial cost of \$79 per year, guaranteeing free two-day shipping as essential perk, it has over the time expanded to cover a broad spectrum of benefits that 100 million people worldwide subscribe to.⁴¹²⁶ Amazon has used Prime to test new services, such as same-day delivery, Prime Days (responding to Black Friday), Prime Pantry (order of non-perishable household items at a flat fee), free movies, photo storage, and Prime Music, a music-streaming service. The usage habits of Prime subscribers differ significantly: 46 % of subscribers purchase something online at least once a week, compared to only 13 % of other customers who purchase on a weekly basis.⁴¹²⁷

Another pillar of the ecosystem is its integration through devices like **Echo** and **Amazon Kindle**. Unlike Apple that sells hardware with high margins, Amazon makes rather little profit from the mere sale of its hardware. Kindle combines Amazon’s carryover from the ebook market with hardware investment. While Kindle falls short on many accounts to be the technically best tablet, it established itself as a low-priced tablet that offers an easy integration into the Amazon ecosystem and content provision. Amazon Echo expands the ecosystem to smart homes. For instance, Amazon has issued a HomeKit for developers and an Alexa Connect Kit for consumers that allows to place a broad range of devices under the control of Alexa. Like other personal assistants, Echo’s profitability hinges upon data capture and consumer loyalty, both key features to other services in the Amazon ecosystem.⁴¹²⁸

1.2.3.1. Amazon Marketplace

Amazon Marketplace currently lists 6M sellers, out of which 2.5M are active with products for sale. 200K sellers make an annual revenue of more than \$100K, 24K sellers make more than \$1M.⁴¹²⁹ More than 3K new sellers join Amazon every day. On Mar-

4129 <https://www.marketplacepulse.com/amazon/number-of-sellers>.

ketplace, Amazon provides infrastructure, warehouses, a fulfilment network, financial services and access to millions of customers – it is described as a “quasi-state”, requiring fees, not taxes.⁴¹³⁰ Sellers can choose between a fulfilment by the merchant (FBM) or fulfilment by Amazon (FBA). FBA goods are directly stored in Amazon’s fulfilment centres and both shipment and customer services are taken care of by Amazon.

For professional sellers (ie more than 40 intended sales per month), Amazon charges a monthly subscription fee of \$39,99 as well as a referral fee and a closing fee that vary depending on the product type and generally amount to 15-20% of the total item price.⁴¹³¹

Many sellers centre – as intended by Amazon – their entire business around Amazon Marketplace. Thereby, they become heavily dependent on the continuation of the co-operation. At the same time, Amazon deploys a strict contractual regime towards third-party sellers and enforces it through economic pressure and technological implementation (see *infra*). In addition, competing sellers use Amazon’s rules to the extent that they protect sellers to get rivals suspended through certain practices. One of such means is to buy fake five-star reviews for competitors in order to have them violate the Amazon review policy; others include filing false intellectual property reports, reclassifying rivals’ listings in unfitting categories and trademark tampering.⁴¹³² Once a suspension is issued by Amazon, there is few and opaque means of appeal, which has given rise to a specialized industry of consultants that challenge Amazon’s suspension decisions. They claim knowledge of or familiarity with internal Amazon data and seller accounts which has become traded on a black market. For many sellers, a case being brought by Amazon is reportedly perceived as more threatening than an actual court proceeding.⁴¹³³

1.2.3.2. Governance between Amazon and retailers

The relation between Amazon and third-party sellers on Amazon Marketplace is governed by the *Amazon Services Business Solutions Agreement*⁴¹³⁴ (hereinafter: Business Agreement) and, more specifically, the *Selling on Amazon Service Terms*⁴¹³⁵ (hereinafter: Selling Terms). The practices on Amazon Marketplace have been under review by the French⁴¹³⁶, Austrian⁴¹³⁷, German⁴¹³⁸ and European⁴¹³⁹ competition authorities. On July 17, 2019, the German proceedings were settled following Amazon’s concession to signifi-

4139 <http://competitionlawblog.kluwercompetitionlaw.com/2018/11/30/the-eus-competition-investigation-into-amazon-marketplace/>.

cantly alter its terms towards Marketplace sellers.⁴¹⁴⁰ On the same day, the EU COM announced the opening of formal antitrust proceedings, inter alia looking at the standard agreements between Amazon and marketplace sellers with respect to Amazon's right to analyse and use third party seller data.⁴¹⁴¹ Besides the fairness of contractual terms, a major concern is the dual role of Amazon as provider of infrastructure and merchant itself which rises doubts about Amazon's use of data collected from third-party sellers. Reports state that Amazon allegedly offers own products at a cheaper price than third-party sellers so that it appears on top of the list. Based on market data gathered through third-party sellers, Amazon's commercial risk could in this constellation be close to zero.

Before the amendments announced on July 17, 2019, particular concerns regarding specific clauses related to a lack of transparency and unexpected and unclear termination, a lack of possibilities to enforce contractual obligations on Amazon and reach clarity on the matters of a dispute, a perceived disadvantage of sellers in customer reviews, as well as the obligation to grant Amazon the right to use product and other business information. Three of these aspects and the current modifications shall be presented in more detail.

Right to suspension

Both agreements gave Amazon broad and unlimited discretion to end the business relationship without notice and justification and at any time.⁴¹⁴² A suspension decision against a seller could be "appealed" through an online procedure provided for by Amazon.⁴¹⁴³ This required to detail a 'plan of action' that contains steps to which the seller commits to 'correct the problems (he or she) identified'. In practice, reasons of suspension seemed oftentimes unclear and non-transparent to the seller, especially in case of targeted involvement of a competitor. In such cases, sellers may be compelled to "admit" wrongdoings which they are not responsible for just in order to be able to formulate a plan to overcome them.

The low degree of transparency and foreseeability in the suspension decision and subsequent appeals proceedings indicates a strong level of social control through soft governance that puts sellers under a constant threat. Through the immense importance of listings and reviews, this threat also materializes technologically. Several cases are being reported of a sudden change in listing positions without any apparent reason.⁴¹⁴⁴ Given that less than one quarter of searches on Amazon concern a specific brand (eg "Nike

4142 Art. 1 Business Agreement: „We may at any time cease providing any or all of the Services at our sole discretion and without notice.“; Art. 3 Business Agreement: „We may terminate or suspend this Agreement or any Service for any reason at any time by notice to you. You may terminate this Agreement or any Service for any reason at any time by the means then specified by Amazon.“.

4143 <https://sellercentral.amazon.com/gp/help/external/G200370560>.

4144 <https://www.politico.eu/article/amazon-europe-competition-giveth-and-amazon-taketh-away/>.

sport shoes”) whilst the vast majority is generic (“sport shoes”), the power of listings is tremendous.⁴¹⁴⁵

In the future, the termination will require 30 days’ notice. In case of extraordinary termination, ie a termination based on alleged breach of legal rules by the seller), Amazon will inform the seller and provide reasons, unless this would require Amazon to disclose details on its control system for fraudulent behaviour.

Liability

Under the existing rules until July 2019, Amazon is granted a comprehensive limitation of liability, towards third-party sellers and customers.⁴¹⁴⁶ Interestingly, in a recent ruling by the 3rd US Circuit Court of Appeals in Philadelphia⁴¹⁴⁷, Amazon was found liable for a defectuous product sold through Marketplace by a third-party seller. With the announced changes in the aftermath of the agreement reached in the Bundeskartellamt proceedings, Amazon will be liable in its European activities to the same extent as sellers for intent or gross negligence and for any breach of major contractual obligations.

Dispute resolution

The established rules foresaw mandatory arbitration as dispute mechanism, insofar as legally permissible⁴¹⁴⁸; for court proceedings, Luxemburg was given as only competent jurisdiction. With the current reform, Amazon has given up the exclusivity of Luxemburg as competent jurisdiction, even where permissible under international private law.

1.2.4. Needs and barriers

While Amazon retains the top spot in the online retail market, it is precisely the spread of its ecosystem that exposes it to a wide range of competitors and, threats of substitutes and new entrants. Amazon describes a number of factors that could result in detriments to its ecosystem which becomes vulnerable essentially through its complexity and interconnectedness. In essence, it is built around Amazon’s ability to predict customer demand through data and thereby optimize fulfilment. Fluctuations can result

⁴¹⁴⁵ <https://www.marketplacepulse.com/articles/only-22-of-searches-on-amazon-include-a-brand-name>.

⁴¹⁴⁶ Art. 8 Business Agreement: „WE WILL NOT BE LIABLE (WHETHER IN CONTRACT, WARRANTY, TORT (INCLUDING NEGLIGENCE, PRODUCT LIABILITY, OR OTHER THEORY), OR OTHERWISE) TO YOU OR ANY OTHER PERSON FOR COST OF COVER, RECOVERY, OR RECOUPMENT OF ANY INVESTMENT MADE BY YOU OR YOUR AFFILIATES IN CONNECTION WITH THIS AGREEMENT, OR FOR ANY LOSS OF PROFIT, REVENUE, BUSINESS, OR DATA OR PUNITIVE OR CONSEQUENTIAL DAMAGES ARISING OUT OF OR RELATING TO THIS AGREEMENT, EVEN IF AMAZON HAS BEEN ADVISED OF THE POSSIBILITY OF THOSE COSTS OR DAMAGES. FURTHER, OUR AGGREGATE LIABILITY ARISING OUT OF OR IN CONNECTION WITH THIS AGREEMENT OR THE TRANSACTIONS CONTEMPLATED WILL NOT EXCEED AT ANY TIME THE TOTAL AMOUNTS DURING THE PRIOR SIX MONTH PERIOD PAID BY YOU TO AMAZON IN CONNECTION WITH THE PARTICULAR SERVICE GIVING RISE TO THE CLAIM.“

⁴¹⁴⁷ Case No No. 18-1041, available at <https://www2.ca3.uscourts.gov/opinarch/181041p.pdf>

⁴¹⁴⁸ Art. 19 Business Agreement.

due to factors arising at all stages, from a healthy customer base to regulation and usage habits in e-commerce, IT infrastructure, changes in the product market, legal proceedings, investment strategies and external threats such as cybercrimes and terrorism.⁴¹⁴⁹ Currently, counterfeit reduction and competition by both bigger and niche online retail services are high on Amazon's agenda, since switching costs for consumers to other retailers are still fairly minimal. For its international business activities, a favourable regulatory landscape to Internet business and e-commerce in particular is vital.

1.2.5. Summary of the Case study

Many features of Amazon's ecosystem of today already shine through, rudimentarily of course, in mission statements of the early years. The use of data across its services combined with high investments in consumer loyalty has spurred the diversification of Amazon's services and made it an exemplary case of an ecosystem, namely a one-stop shop and first address for many consumer services. The cloud-based services developed for its own operations have been transformed into a service in its own right, AmazonWeb-Services, that forms a central pillar of Amazon's business model independent of the retail activities. To govern the ecosystem, most importantly on Amazon Marketplace, Amazon uses strict terms deployed legally and technologically through listings towards third-party sellers. To what extent these are used solely to guarantee a level of quality and homogeneity of the Marketplace offers or also to put own products and services in an advantageous situation is currently under investigation by several competition authorities.

1.3. Airbnb^{4150*}

1.3.1. Nature of the competitive game

Spurred by market leader Airbnb, the platform economy is transforming the short-term rental market, typically dominated by hotels with stable business models and market structures. Its rapid growth has not only made them a serious competitor for the hospitality industry and travel sector more widely but is forming novel ecosystems of related digital and analogous services. Alongside, this transformation impacts on city economics, influencing tourism destinations, the composition of neighbourhoods as well as concepts of "mobility" and "home".

1.3.1.1. Airbnb's story of growth

Airbnb, Inc., headquartered in San Francisco, is a global online marketplace for home-sharing and short-term rentals of private homes and apartments. It largely does not own

⁴¹⁴⁹ Amazon, Inc. Annual Report 2018, available at <https://ir.aboutamazon.com/static-files/0f9e36b1-7e1e-4b52-be17-145dc9d8b5ec>.

⁴¹⁵⁰ * Klaas Hendrik Heller.

real estate of its own but acts as a broker between „guests“ and „hosts“ and receives commissions from every booking. Founded in 2008, Airbnb today has 6M+ listings by 650K+ hosts in 191+ countries.⁴¹⁵¹ On an average night, 2M+ people are staying on Airbnb per night. In New York, for example, Airbnb listings make up around 20 % of the guest room supply (globally: 5.4 %).

Airbnb has not released full company reports, but its increase in guests up to 500M by the end of the first quarter of 2019. In the third quarter of 2018, Airbnb announced that it had passed \$1 billion in its quarterly **revenue**.⁴¹⁵² During financing rounds in 2016 and 2017, it had been valued at over \$30 billion. Airbnb is expected to have its IPO in 2019 or the near future. Initially supported by Y Combinator, Airbnb has received significant venture capital investments since 2010, including a 1.5 billion investment by General Atlantik and others in June 2015, a billion by GPMorgan Chase & Co in June 2016 and a combined billion by Capital G in September 2016 and March 2017.

The US continues to be the largest **geographical market** for Airbnb but it is said to have room to grow especially in emerging markets in Africa and India. In China, it is facing some local competition by rivals Tujia and Xiaozhu. Lately, Airbnb is partnering with property developers to turn entire buildings into Airbnb listings, under the auspices of a hotel-like brand, Niido. Through this, Airbnb plans to own 14 home-sharing properties by 2020.

1.3.1.2. From homesharing to hotel business: Airbnb's reconfiguration of markets

In the early phases of operating, Airbnb hosts were for the most part relatively typical households seeking to generate extra income by renting out rooms or their entire residence while away. Over time, Airbnb bookings have become concentrated among more professional „hosts“ that act similarly to miniature hotel companies and rent out entire homes all year long. The number of so-called „multi-hosts“ (namely hosts with more than one listing on Airbnb) is growing faster than the single-hosts.⁴¹⁵³

As a consequence, Airbnb today intersects different markets, notably homesharing, rental agencies, hotel services, hostels, as well as full-service booking agencies. Competition among Airbnb and hotels is therefore growing. While differences in the type of demand remain (with hotels having more male, business, shorter and week-days guests)⁴¹⁵⁴, Airbnb's current strategy eg involves expanding in the business travel, family leisure and upscale market segment. The latter can be manifested by a new service, Airbnb Plus, as well as partnerships with Luxury Retreats. Compared to hotels, Airbnb carries a considerably smaller risk since it owns no inventory itself and can react more fluidly to market change. Unlike hotels whose inventory is flex, Airbnb hosts can more

⁴¹⁵⁴ For more details cf str, Airbnb & Hotel Performance. An analysis of proprietary data in 13 global markets, 2017, available at http://www.str.com/Media/Default/Research/STR_AirbnbHotelPerformance.pdf.

easily add and remove supply and follow market trends, both with regard to new destinations and time periods of high demand. More importantly, it outperforms hotels with regard to parameters linked to the “experience economy”, such as personalization, localness, hospitableness, serendipity, and ethical consumerism.⁴¹⁵⁵

After a first phase of denying direct competition between Airbnb and hotels, followed by a second phase of hotels actively attacking the Airbnb business model for circumventing regulatory standards, hotels are currently seeking to participate in the business model by offering rooms on homesharing platforms and adding homesharing attributes to their properties. For instance, Accor has purchased Onefinestay and build a new brand (Jo & Joe); while Hyatt and Marriott both partner with homestay platforms (Oasis; Tribute Portfolio Homes respectively).

1.3.2. Business Models

As a broker, Airbnb allows homeowners (and also tenants) to add another source of revenue from their homes by decreasing the transaction costs for short-term rentals (such as advertising, screening of tenants, alternative accommodations for themselves). As a consequence, short-term and long-term rentals could be mixed more easily, while short-term rentals continue to be more lucrative. Airbnb itself essentially generates revenue through fees charged to both hosts and guests for every booking. It does *not* use advertising to other sites as a source of revenue. In addition to being a home broker, Airbnb entered the travel events sector (“Airbnb Experiences”) in 2015.

The **pricing of individual listings** however is ultimately to be controlled by the host. Hosts are facing the difficulty that no two listings are wholly comparable and Airbnb has an interest of its own in realistic market prices. Therefore, it uses market data based to make so-called “Price Tips” that can also be customized (“Smart Pricing”). Also, independent data initiatives are offering assistance to hosts to determine their pricing strategy.⁴¹⁵⁶

Host service fees are generally 3%, with exceptions in Italy and hosts with a “Super strict” cancellation policy. The fee is calculated from the booking subtotal (including nightly rate and cleaning fee, but not Airbnb fees and taxes). As per official Airbnb communication, **guest service fees** range between 0-20 % of the booking subtotal. It is determined based on a series of factors such as the reservation subtotal, the length of the stay, and characteristics of the listing. Guest fees are degressive in relation to the reservation costs⁴¹⁵⁷, but the actual calculation method remains undisclosed and essentially obscure to users. This two-sided monetization policy (hosts/guests) reflects the idea that Airbnb wishes more flexibility in attracting guests than

4155 M. Mody/M. Gomez, Airbnb and the Hotel Industry: The Past, Present and Future of Sales, Marketing, Branding, and Revenue Management, Business Practices, Fall 2018, available at <https://www.bu.edu/bhr/2018/10/31/airbnb-and-the-hotel-industry-the-past-present-and-future-of-sales-marketing-branding-and-revenue-management/>.

4156 See eg <https://airbnb.design/smart-pricing-how-we-used-host-feedback-to-build-personalized-tools/>.

4157 <https://www.airbnb.ie/help/article/1857/what-is-the-airbnb-service-fee>.

hosts. Airbnb is constantly reviewing its fee policy, testing eg an increased host fee for hosts coming from Google Ads in 2016⁴¹⁵⁸ and, more recently, an option for hosts to include the totality of fees into their costs. This option which is “recommended” to hosts in the Airbnb interface, leads to a new standard Fixed Fee format at 14 %.

Airbnb’s **business model** has been described as **highly transformative** in a recent Harvard Business Review study which highlighted (1.) the way Airbnb personalizes the service to customer needs, (2.) its implementation of a new asset sharing regime that unlocks value for both sides, (3.) its new alliances within its ecosystem and (4.) an agile and adaptive organizational structure.⁴¹⁵⁹

At the same time, Airbnb has sparked controversy related to the **social costs of its business model** which are generally seen in higher housing costs for city residents through the decrease of long-term housing offers, the loss of city tax revenue, negative externalities through short-term rentals (generally addressed by zoning laws) as well as negative impact on employment quality in the cleaning and maintenance sector which becomes more informal as compared to the classical hotel business. A study⁴¹⁶⁰ on the impact of Airbnb in predominantly Black NYC neighborhoods found that Airbnb hosts are 5 times more likely to be white and Airbnb host population is 74% white (compared to 13,9 % of residence population). The economic benefits of Airbnb accrue disproportionately to white residents and Airbnb hosts, leading to racial gentrification.

The data visualization project „Inside Airbnb”⁴¹⁶¹ scrapes listing data from Airbnb to illustrate the shift towards highly available and multi-listings that are less likely to be used as residential housing.

City	Listings	Percentage of entire homes	Average price/night	Occupancy rate (est.) in nights/year	Listings w/high availability	Percentage of multi-listings
Berlin	22,552	47,5	67 EUR	102	28,2	23,6
Paris	59,881	86,8	111 EUR	92	28,2	19,9

1.3.3. Ecosystem

Airbnb stands at the center of an ecosystem that englobes a constellation of products,

4158 See https://all-about-airbnb.com/post/127174229801/airbnb-hidden-revenue-hack-extra-host-fees-google-ads?utm_campaign=google_ads_fees&utm_medium=link&utm_source=quora.

4159 S. Kavadias/K. Ladas/C. Loch, The Transformative Business model. How to tell if you have one, Harvard Business Review 2016.

4160 <http://insideairbnb.com/face-of-airbnb-nyc/>.

4161 <http://insideairbnb.com/>.

organizations and people across conventional industry clusters which are connected through the Airbnb platform. Beyond the homesharing service strictly speaking, the ecosystem facilitates a “travel experience” more widely.

Hosts

Participants to this ecosystem are first and foremost the hosts. Those include single-hosts as well as multi-hosts, among them a growing number of conventional hotels and hotel-like services. Airbnb has been seeking to bridge with hotels through mergers and by granting them access to its platform. Hosts are free to decline or accept guests within the boundaries of Airbnb’s antidiscrimination policy and can set up house rules.

The relation between Airbnb and hosts as well as among hosts is crucially determined by the Airbnb **search results algorithm**. The nearly 100 features which the algorithm considers are confidential, but Airbnb states that among them are guest needs (derived from guests’s previous bookings, profile and user behaviour), listing details and trip details. Generally, Airbnb boosts listings with high click-to-booking rates, positive reviews, high customer responsiveness with low rejection rates as well as competitive prices. Also, hosts with good performance can obtain the ‘superhost’ status which grants them credibility towards guests and is a tool to tie them to the Airbnb platform.

An important set of data is acquired through guest and host reviews. Remarkably, the average rating on Airbnb lies between 4.5-5 (highest possible rating), while on TripAdvisor, it is only 3,8/5. Some suggest that this gap results from the specifics of the sharing economy.

Airbnb is concerned with maintaining a high quality of listings and considers removing an established experience listing (>20 reviews) if the average rating falls at or below 4.7.

Airbnb’s Terms and conditions seek to standardize the booking procedure and categorize listings to offer guests the benefit of familiarity in case of repetitive booking. Interestingly, while Airbnb disposes of a dispute resolution mechanism for complaints between users and guests, this feature is barely advertised and put to the forefront, possibly in order to draw less attention to the possibility of an unpleasant occurrence.

Travelling amenities

By adding the pretty robust “Experiences” section, Airbnb has entered the classical travel agency market. Guests are enabled to book a variety of adventures, services (like restaurant visits – through the acquisition of Resy in 2017).

Host service suppliers

Among the services that have emerged in order to facilitate the organizational side of Airbnb bookings, Guesty offers a one-stop service platform to manage listings across online travel agencies as well as guest-centric tools such as a unified inbox, automated tasks, and 24/7 guest communication services. Competitors include Vacasa, Turnkey,

Airsorted, and Kigo. Airbnb aims at standardizing the logistical procedure (check-in, communication) for a smooth guest experience.

A series of services offer alternative pricing algorithms to hosts, such as “Market Minder” (by AirDNA) via web scraping.

Local facility services

The Airbnb ecosystem has spurred the emergence of facility services tailored to the needs of Airbnb listings. Some tools offer eg check-in/concierge services (GuestHop) or cleaning (Handy).

Airbnb offers US hosts to take the „Living wage pledge”, a commitment to paying cleaners and other personnel that assists in the maintenance of apartments a minimum wage determined by experts around the National Domestic Workers Alliance (NDWA). The respective listings will have a badge displayed online allowing guests to give preference to such places.

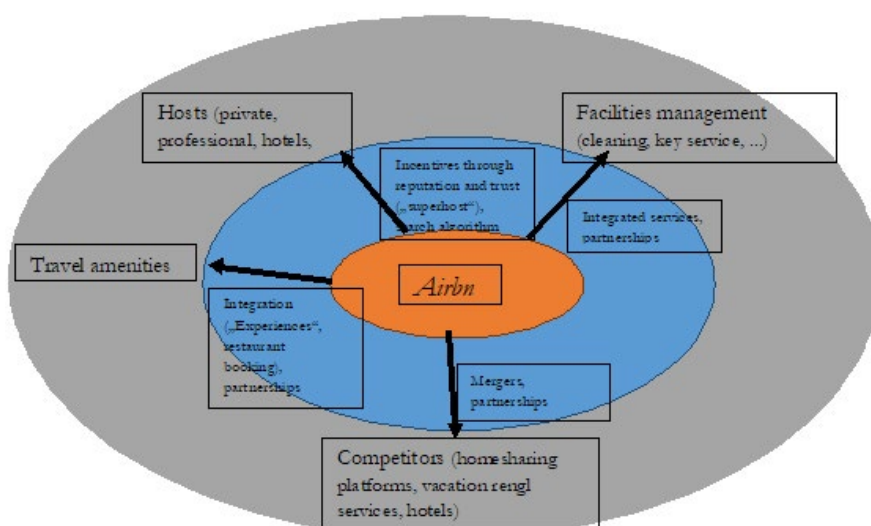

Competitors

Airbnb’s history of mergers illustrates a transformed sense of the markets in which it operates and proves the importance of acquisitions for Airbnb’s story of growth. Initially, Airbnb acquired competitors with similar business models (such as Accoleo in 2011) and over time had sufficient growth rates to outperform others. While Airbnb is leading globally within the online homesharing platform market, its merger activities have transformed and focused on a better IT infrastructure (eg pre-installation on Telekom mobile phones), community-building (eg Bitrefill, enabling bitcoin purchase of gift cards), integration with other travel services and expansion into the hotel sector, including luxury retreats.

Today, most competitors in Europe and the US have roots in the hotel business or vacation rentals. Airbnb’s most notable competitor is HomeAway, the owner of US-based Vacation Rental By Owner (VRBO) that specializes in vacation rentals of entire homes of all types. It was founded in 1995 and belongs to HomeAway since 2006.

Competitor Wimdu, held by Novasol, was a Berlin-based home-sharing platform founded in 2011 with around 1M users and 350K listings in 150+ countries but was shut down in 2018. It had earned more than 90M € of financing and merged with a large competitor 9flats in 2016 but failed to become profitable.

In China, a market that Airbnb is pursuing a growth strategy in (under the name “Aibiy-ing”, since 2017), local competitors are Oyo, Tujia.com, and Xiaozhu.

1.3.3.1. Contractual Governance

Both hosts and users are bound by the Airbnb Terms of Service⁴¹⁶² as well as related rules, such as the Privacy Policy⁴¹⁶³ and the Host Guarantee⁴¹⁶⁴. As regards other actors in the ecosystem, ie facilities managers and booking assistants, little information is publicly available. Airbnb's terms limit Airbnb's role to a mere matching platform and cautiously stipulate that Airbnb is neither party to the agreement between host and guest, nor responsible for the listing (Sect. 1.2). Airbnb reserves a right to termination after 30 days' notice (Sect. 15.3). For claims brought in the US, the dispute mechanism foresees mandatory arbitration.

1.3.3.2. Soft Governance

Strong soft governance incentives are provided through reviews and the listing algorithm. Airbnb's terms explain that the placement and ranking of listings is subject to such an algorithm that includes a series of factors, essentially making its inner processing impossible to predict from a host perspective (Sect. 7.1.6). Reviews (Sect. 10) are an important element as part of the algorithmic listing decision and a guest's booking decision. Weak reviews can lead to a suspension from hosting on the platform. Invitations and reminders to submit a review are presented as a personal curtesy towards guests/hosts and a service to the community; whilst for Airbnb, reviews provide a most valuable data set. Likewise, users are invited to fill in user profiles, respond to surveys, post in community forums and share experiences to improve their "user experience" with Airbnb (Privacy Policy, Sect. 2.1). As per Privacy Policy, Airbnb collects geo-location information, usage information (search history, activities on the Airbnb platform), log data and device information, cookies and payment data. When a user links, connects or logs in to Airbnb through a third party service, Airbnb may receive information via this third party

4162 <https://www.airbnb.com/terms>.

4163 https://www.airbnb.de/terms/privacy_policy.

4164 https://www.airbnb.de/terms/host_guarantee.

service, such as friends lists and profile information. Also, further background information on criminal convictions may be obtained from public records in the US.

1.3.3.3. Technological Governance

While Airbnb claims to act, as per its terms, as mere broker, it regulates the communicative and market setting between guests and hosts in important ways. For once, Airbnb restricts the channels of communication in order to prevent off-platform deals that would jeopardize its business model and revenues. Besides, Airbnb makes recommendations to hosts as regards pricing and other features of the listing, based on its algorithmic comparisons. Here, Airbnb clearly takes a stronger guiding role than eg eBay does, echoing its stronger interest in homogeneity in the presentation of listings in order to create consumer loyalty.

1.3.4. Needs and barriers

Airbnb's business model offers homeowners a convenient platform to realize short-term rental rents ('excess capacity') and guests a cheaper, more diversified alternative to a hotel stay. The digital interface and data streams of Airbnb have solidified its position on the market. Challenges here are the perpetuation of a high listing quality and guest satisfaction. Currently, user complaints arise for the most part due to bookings cancelled by the host (20,5% of user complaints), scams (15,4 %), unsafe or unpleasant conditions (13,5 %), differences between the unit and its listing (12,2 %), and discrimination (1,1 %). In addition, the degree of capacity utilization continues to be lower than in hotels.

Current regulatory barriers include a fragmented local legal landscape with regard to short-term rentals. Not only has Airbnb faced claims of tax circumvention and lack of a level playing field with hotels, also major cities including New York, Barcelona, Paris and Berlin have enacted restrictive legislation on short-term rentals. Airbnb has been vocal in the public debate around its business model through ads, interviews and lobbying.

1.3.5. Conclusion

Airbnb's story of growth is paradigmatic for a digital platform and ecosystem, both through its strategy of acquisitions and its current regime of private governance. By infusing it with data-driven and digital technology, Airbnb has reconfigured the short-term rental market and today forms the center of an ecosystem that transcends the boundaries of conventional business sectors. The private governance regime ensures that Airbnb can act as a mere broker, shielded from liability in a legal sense and exempted from the need to invest itself in infrastructure and labour for listings. In other words, the character of Airbnb as a digital network, as compared to an owner of real estate, is preserved through the governance regime.

1.4. Tinder^{4165*}

1.4.1. Nature of the competitive game

1.4.1.1. The specificity of the online dating industry

For the sole US market, the online dating industry has generated around \$3 billion in 2018⁴¹⁶⁶ with an estimated 50 million Americans using websites or mobile dating apps. The market is booming as the use of online dating has tripled amongst the young (18-24) from 2013 to 2015⁴¹⁶⁷. The online dating market has also proved to be attractive for other categories of adults with the share of 55 to 65-year-old people doubling between these same two years. Specialists predict no downturn with revenue expected to reach a new high by 2020.

Online dating has benefited from the success of social-networking platforms. While, Facebook introduced the concept of making friends online, apps such as Tinder have extended it to the dating sphere. In a world where socialisation has become steadily more digital, the success of online dating platforms may thus be attributed to a more general trend. However, social-networks and online dating apps do not target strictly identical markets. The industry of online dating differentiates itself from other social platforms by the inherent purpose it seeks to pursue. While social networking helps users find a friend, dating platforms help users find a date. Obviously, those who decide to give online dating a try are likely to already be familiar with the social networking world. However, social network users are not necessarily keen on engaging in online dating. For this reason, the two industries do not appeal to the same exact consumer base.

While not being strictly alike, the worlds of social-networking and online dating appear to be highly complementary. The most recent innovative dating apps have indeed come up with new strategies to capture consumers' data. *Tinder*, for example, offers its consumers to get access to the service for free and allow them to link up their other social media accounts in order to fasten the registration process. Most users thus associate their account with *Facebook*, *Spotify* and *Instagram*⁴¹⁶⁸. If the platform does not generate direct benefits from it, it manages to grow a substantial user base and therefore capture a big amount of data.

1.4.1.2. The online dating value chain

The extraction of value within the online dating value chain follows an input-output production process that may be segmented into three steps. From the collection of data to its monetisation, online dating platforms manage to generate revenues by several means. Firms that do not directly belong to the dating sphere take their part in this process.

The first segment includes firms such as social networking platforms and dating apps themselves. This primary activity boils down to the capture and storage of users' data. Old-fashioned platforms such as *Match.com* engage in this process by their own means, requiring users to give as much information as possible in order to implement an efficient pairing system. As for emerging platforms such as *Tinder* or *Bumble*⁴¹⁶⁹, they allow users to access the service for free and to link their social-networking platforms such as *Facebook*, *Instagram* or *Spotify*. By offering the possibility to register via *Facebook*, *Tinder* accesses precious data and appeals to a large user base. This data-capture segment is essential to perfect algorithms and adapt advertising and making it more accurate. If capturing data is a priority for a majority of dating apps, most digital platforms engage in such practices as a large database favours more accurate advertising. In a report published by *McKinsey*⁴¹⁷⁰, Alessio Botta, Nunzio Digiacoimo and Kevin Mole outline the importance of capturing two types of data in the monetisation process. Enterprise level data, in the one hand, comprise information such as customer preferences, needs assessment etc. Supplemental data, in the other hand, are the raw data obtained through various means such as, for *Tinder*, social media linking. Companies get access to a mix of both types of data. By combining these two categories, which range from sociodemographic profiles to online preferences, platforms may start to create value.

The second segment includes firms that advertise through the swapping process as well as dating apps themselves. It boils down to the user's profile set-up and its pairing with other users' profiles. When swiping to find potential matches, users of dating apps stumble on numerous ads. Thanks to the previous collection of data, the platforms can provide advertisers with key data in order to be more accurate in the way they target their consumers. This segment constitutes a first step in the monetisation process. And with the online dating market booming, marketers have seen their incentive to use such platforms growing. In May 2015, *Twentieth Century Fox* launched a now famous advertising campaign on *Tinder*, using the original concept of embedding four of their new movie's characters into the swiping process⁴¹⁷¹. Users were free to like one of the actors and could earn the possibility to catch an early local screening of the movie. The same year, *Starbucks* reached

4169 M. Lin. 'Online Dating Industry: The Business of Love' (Finance, September 2018). <https://www.toptal.com/finance/business-model-consultants/online-dating-industry>.

4170 A. Botta, N. Digiacoimo, K. Mole. 'Monetizing data: a new source of value in payments' (September 2017 – McKinsey&Company). <https://www.mckinsey.com/industries/financial-services/our-insights/monetizing-data-a-new-source-of-value-in-payments>

4171 L. Johnson. 'Brands Make a Match With Dating Aps' (May 2015 – Adweek). <https://www.adweek.com/digital/brands-make-match-dating-apps-164805/>

an agreement with *Match.com* to launch a commercial campaign through their website. Other ways of advertising through online dating have been experienced such as reward-ed videos. This technique, utilised by *Meetme*, consists of in-app videos that the user can watch in order to access the premium subscription features without paying the fee.⁴¹⁷²

The last identified segment includes dating apps and consists of direct data monetisation through the offering of enhanced features. This type of monetisation remains the first source of revenue for dating apps. If most dating apps are free to access, they manage to make a fringe of their userbase pay for premium versions of the service. *Grindr*, for example, generates 75 percent of its revenue from its enhanced version, which can cost users from \$12 to \$60 a month.

1.4.1.3. A rapidly-changing horizontal competition

A two-tier competition

The horizontal competition within the online dating industry has been through big changes in the past few years with the emergence of platforms such as *Tinder* or *Bumble*. There are basically two types of consumers that can be targeted within the dating market. The first type comprises people searching for serious relationships, thus willing to put effort and money in the dating process. The other type, which tends to gather a younger user base, comprises people who are joining online dating apps for fun. The major players all possess their own competitive advantage and basically fall within two categories⁴¹⁷³. *Match.com*, for example, uses a system of monthly subscription that keeps non-serious users away from the platform. By doing so, they ensure their customers to meet only with other dedicated users. As for *Tinder-like apps*, they managed to succeed in the market by offering a free and intuitive experience. Some platforms utilise the same features and concept but target specific niches within the online dating industry. *The League*, for instance, appeals to young and ambitious professionals. *Grindr* is very similar to *Tinder* but essentially targets the gay community. Basically, the online dating industry actors present rather similar concept and features but differentiate from each other on the user base they try to target.

Tinder's story of growth

"*Match, Chat, Date*". *Tinder* has positioned itself as a leader in the dating market by developing an entertaining approach. With 2 million matches a day, 1 million physical encounters a week and a presence in 190 countries, *Tinder* has broken the classic cultural barriers of seduction and turned it into a game. Sean Rad, one of the founders, initially created the application to alleviate the stress of rejection. The app then made multiple

4172 D. Priftis. 'Monetization models in dating apps – it's a match' (February 2019, Pollfish). <https://www.pollfish.com/blog/app-monetization/monetization-models-in-dating-apps%E2%80%8A-%E2%80%8Aits-a-match/>

4173 M. Lin. 'Online Dating Industry: The Business of Love' (Finance, September 2018). <https://www.toptal.com/finance/business-model-consultants/online-dating-industry>.

adjustments to optimize the concept and support its development. After winning the *TedCrunch's Crunchie Award* for "Best New Startup of 2013", *Tinder* integrated the swiping feature in 2014, which aimed at gamifying the platform. The *Rewinding* and *Superlike* features incorporated in 2015 also reinforced this aspect by providing "bonuses" to users. Besides the user interface, the structure of the platform was also part of the success. *Tinder* indeed implemented a competitive system by using "Elo Scoring". This algorithm granted an indicative rating of "desirability" based on profile information and matches obtained. It allowed users with similar "desirability scores" to meet each other. Today the app has refocused on a system based on online activity by rewarding the most regular users without completely giving up on the algorithm.

Throughout its evolution, *Tinder* has become the biggest contributor of the *Match Group* turnover, representing nearly 23,5% of its revenues. The brand has capitalized on its innovative principle by protecting the concept and securing it economically and legally.

Facebook entry in the market

However, the dynamics could potentially change with the arrival of one big competitor from the social-networking value chain. *Facebook* has indeed recently decided to enter the online dating market thus threatening the leadership of *Match Group*.⁴¹⁷⁴ Its desire to compete in the online dating industry has been followed by a period of test, with the new dating platform being launched in Columbia. The American company will seek to attract customers searching for serious and long-term relationships, thus taking its distance from *Tinder*-like apps. Despite its late entry in the market combined with its desire to stick to the "old-fashioned" online dating concept, *Facebook* can rely on two non-negligible advantages. First, most people have a *Facebook* account, meaning that engaging in an online dating experience could become normalised, tempting more consumers that were reluctant to participate in an online dating activity. Second, *Facebook* has a long-time experience in social relationships and benefits from a unique algorithm based on factors like common friends and events' attendance. It would be able to use its precious data and already plans to introduce new features such as the possibility to only date people who attended the same kind of events for example.

1.4.2. *Tinder's* Ecosystem

As mentioned above, two types of platforms compete by respectively targeting dedicated users and entertain-oriented ones. Nonetheless, the online dating market is dominated by one company, the *Match Group*, as it holds 10 dating platforms, including the two most successful ones, *Tinder* and *Match.com*.⁴¹⁷⁵ It therefore manages to compete in both tiers of the online dating industry. As part of the holding, *Tinder* must implement

4174 L. Matsakis. 'Facebook is testing its dating service. Here's how it's different from tinder' (Wired Magazine – September 2018). <https://www.wired.com/story/facebook-dating-how-it-works/>

4175 M. Lin. 'Online Dating Industry: The Business of Love' (Finance, September 2018). <https://www.toptal.com/finance/business-model-consultants/online-dating-industry>.

its strategy within a global approach. Tinder's ecosystem comprises the other platforms owned by the Match Group, direct competitors and other social-networking platforms.

1.4.2.1. 1st layer: the other nine platforms owned by *the Match Group*

The 10 companies that form the *Match Group* form the first layer of *Tinder's* ecosystem. Namely, these companies are *Match.com*, *PlentyofFish*, *Meetic*, *OurTime.com*, *Twoo*, *Friend-Scout24*, *OkCupid*, *Hinge* and *Pairs*. If holding 10 companies competing within the same market may seem counter-productive, these platforms seem in fact to be complementary. The group states in its 2018 10k form: "*our strategy focuses on a portfolio approach of various brands in order to reach a broad range of users. Our brands are collectively available in over 40 languages all over the world*"⁴¹⁷⁶. *Match.com*, the first platform launched, targets people who seek serious relationships. The platform filters users by charging a monthly fee then dissuading non-committed users from accessing the service. As for *Meetic*, it was the first platform to be available from all kind of technologies (smartphone, tablet, website, wearables) while offering real life events. *Tinder* was launched in 2012 and was aiming to attracting users searching for a more entertaining experience. *OurTime* targets singles aged over 50 while *Pairs* focuses on Asian markets. As part of the Match Group, *Tinder* must undertake an effective strategy that takes into the other platforms.

1.4.2.2. 2nd layer: direct competitors

Tinder also interacts with its direct competitors and tries to keep thriving in the business. Since it has had a massive success after its launched in 2012, the platform has grown increasingly more threatening. Justin McLeod, CEO of *Hinge* described *Tinder* as "*the Gorilla in the casual form of the spectrum*". *Tinder's* main competitors tend to have similar concepts but may still be threatening as they introduce original features. *Bumble* has come up with an original concept as it utilises the same system as *Tinder* with a twist, only women can send the first message. Aware of the threat that it could represent for its most successful platform, the *Match Group* unsuccessfully tried to acquire *Bumble* with a \$450 million bid in 2017. The holding company keeps up with its offensive strategy as it filed a lawsuit against *Bumble* in March 2018.⁴¹⁷⁷ It accused the competing platform of using features that were very similar to those set up by *Tinder*. *Happn* is another rival platform that could threaten the success of *Tinder*. It has developed an original concept that allows users to hook up with people they walked past in the street. This concept has the advantage of offering potential dates to people that already met, thereby making the online dating process less artificial. However, despite competing with ingenious platforms, *Tinder* remains far ahead of its main rivals. According to Statista, a German online portal for statistics, the platform gathered 8.2 million users in America in 2017,

⁴¹⁷⁶ Match Group, Inc (February 2019) 2018 10K form.

⁴¹⁷⁷ Igor Bosilkovski. *Tinder Stings Bumble With A Lawsuit, Bumble Says it Swipes Left*. (March 2018, Forbes). <https://www.forbes.com/sites/igorbosilkovski/2018/03/20/tinder-stings-bumble-with-a-lawsuit-bumble-says-it-swipes-left/#1afdf5b0512c>

against 1.9 million users for *Grindr* and 1.4 million users for *Bumble*.⁴¹⁷⁸

1.4.2.3. 3rd layer: social networking platforms

Tinder interacts with the social-networking platforms it has previously established a relationship with. These platforms are *Spotify*, *Instagram* and *Facebook*. An estimated 30% of *Tinder* users register by linking their *Facebook* account. The dating platform states in its terms of use: “if you use *Facebook* to access *Tinder*, you must authorize us to access certain information from *Facebook* to use *Tinder*.”⁴¹⁷⁹ In fact, the two companies have access to respective database, and it has been revealed in a report issued by the German mobility security company *Mobilsicher*⁴¹⁸⁰ that *Facebook* was gathering information from its partner platforms, including *Tinder*. They have access to users’ activity on the app, IP address and private and dating profiles. The American company set a policy that states it can gather information from third party apps through the Software Developer kit, system that allows users to login via *Facebook*. As for *Spotify* and *Instagram*, they can be directly connected to the user’s account. *Tinder* expended its integration with *Spotify* after the platforms first worked together in 2016. Users can now share small clips while chatting⁴¹⁸¹. As for *Instagram*, it allows users to access potential matches’ photos. The relationship *Tinder* builds with other digital platforms aims at perfecting the pairing system by connecting different database. In the meantime, it allows platforms to access each other’s database therefore collecting key information.

Such social-networking platforms may also turn out to be competitors for *Tinder*. Apart from *Facebook*, which is entering the market of online dating, as mentioned above, other social media such as *Instagram*, *VK* or *Snapchat* are already potential way for people to meet partners.

1.4.2.4. 4th layer: Users (P2C relations)

Unlike the other cases studied, *Tinder* does not act as an intermediary between retailers and buyers or between homeowners and hosts. In other words, *Tinder*’s core activity boils down to offering a service rather than providing businesses with a platform that would allow them to generate money. As a consequence, its governance model is mainly based on the contractual relationship it maintains with its users (P2C relations).

1.4.2.3.1. Contractual relationship and potentially abusive clauses

With the digital economy occupying an increasingly important space in today's societies, legislations in the areas of competition law and consumer protection often prove to be irrelevant or insufficiently strict. Platforms may take advantage of this temporary legal "limbo" to impose abusive clauses on consumers. As for Tinder, it is not known to be a particularly abusive platform when it comes to contractual relationship. However, its terms of use contain certain clauses that have been denounced by the European Commission and labelled "abusive" in its most recent report on the matter⁴¹⁸²:

Right to suspension

Amongst the practices denounced by the EU executive body is the *"platform operator's right to terminate the contract without cause with a notice of less than six months"*. Tinder indeed reserves the right to terminate any user's account if it considers he has violated this agreement. Moreover, it does not provide any refund for purchases made through the app.

It may also delete any content if it solely considers it goes against the platform's terms of use. It means that Tinder reserves itself the right to define what it believes is a *"threatening or offensive"* post.

Liability

Tinder refuses to take responsibility in the case of service malfunctions or potentially harmful user's post. That practice was named by the European Commission as *"Exclusion or limitation of platform operator's liability"*. As it states in its terms of use, *Tinder "takes no responsibility for any content that you or another user or third party posts, sends or receives through the service."*⁴¹⁸³

In the meantime, the platform refuses to bear responsibility for acts carried out by users deciding to communicate off the service or to meet in person. As written in the terms, users *"are solely responsible for" their "interactions with other users"*⁴¹⁸⁴. The company does not engage in criminal background checks and therefore declines all type of responsibility if users behave in a potentially harmful manner once of the grid.

Wrongdoings carried out by third parties such as advertisers and promoters also fall out of the platform's responsibility. It makes it clear in its terms of use that whenever a user decides to enter directly in contact with a third-party, the latter is newly responsible and governs the relationship.

4182 European Commission. 'Study on contractual relationships between online platforms and their professional users'. (EU Publications. April 23, 2018)

4183 Tinder Inc. 'Tinder Terms of Use'.

4184 Tinder Inc. 'Tinder Terms of Use'.

Privacy

The issue of privacy has contributed to harm Tinder's image worldwide since the platform has often been accused of infringing personal data legislations. One of the abusive clauses listed by the European Commission in its study on platforms' contractual relationships is the provision obliging users to *"grant the online platform a right to use business user's photos or other copyright protected material or trademarks."* Tinder effectively engages in such practice since it gets access to data that users agree to share on the platform, including their Facebook information if they decide to link up their social media account. Such data are used by the platform to monetise the service, mostly by providing them to third parties such as advertisers. Moreover, Tinder grants no compensation to users whose data have been utilised: *"by submitting suggestions or feedback to Tinder regarding our Services, you agree that Tinder may use and share such feedback for any purpose without compensating you"*⁴¹⁸⁵.

Dispute resolution

Regarding dispute resolution, US citizens may not engage in any class action, class arbitration, or other representative action. The only way to challenge the company is to use the service of "Binding arbitration" administered by the American Arbitration (AAA). As a consequence, American users must agree to "give up their right to go to court" unless they fill a small claim request.

Regarding consumers residing in the EU or the European Economic Area, they must follow a different procedure as the European Commission set up its own online dispute settlement platform (ec.europa.eu/odr).

1.4.2.3.2. Soft and informal communication: image and communication

To counter the potential bad effects of its contractual governance, *Tinder* has engaged in a communication campaign seeking to explain its collect and use of personal data. Available in its online blog, the platform indeed provides its public with an easy read containing key information on its privacy policy⁴¹⁸⁶.

1.4.2.3.3. Technological landmark and innovative reputation

The key of *Tinder's* success has arguably been the platform's ability to set new technological landmarks in the online dating market, thus acquiring a strong innovative reputation. It was the first to introduce the "swiping" system thanks to which it is still identified as the number one app for a user-friendly and entertaining online dating experience. It has also developed a unique algorithm, namely the "elo score" system, criticised for its discriminatory nature but still considered as a reference in the online dating industry.

4186 Tinder Inc. 'Tinder Privacy Policy' (Tinder Blog, October 2010). <https://www.gotinder.com/privacy-2017-10-26>

1.4.3. Business models

As we have already mentioned the question of business models above, this subpart will be shorter and will seek to explain how the trends occurring within the dating market outline the existence of two clashing concepts. One is booming while the other is slightly losing ground.

Tinder, that leads the US market with 8.2 million active users⁴¹⁸⁷ was the first one to introduce the swiping concept. By also allowing users to link their account with other social media platforms, *Tinder* has been a game-changer in the dating market⁴¹⁸⁸. It has relied on a user-friendly system as it just imports data from Facebook. It was the first dating platform that was solely designed for mobile phones. Also, the swiping system does not let users know if they have not been liked back. This keeps users from developing fear of rejection. *Tinder* competitive advantage boils down to its user-friendly approach. It is easy to use and free, attracting people seeking for entertainment more than serious relationships. This is a huge evolution in the dating market as entertainment has seemed to become the new norm. According to a survey conducted in August 2017, out of 6500 online daters surveyed between the age of 16 and 30, 48% revealed they were mainly searching for fun.⁴¹⁸⁹

The other concept was popularised by *Match.com*. The platform relies on a system of compatibility pairing reached through questionnaires and personal essays. Unlike *Tinder*, the service is not free, and users must pay a monthly subscription. Such a system has proved to be efficient as it sought to address to people who take online dating seriously and are ready to spend a certain amount of money on such sites. However, *Match*-like apps face a double threat. With the rise of *Tinder* and similar platforms like *Bumble*, the dating market has seemed to move towards a more entertaining-centred approach. Also, with *Facebook* entering the market, *Match.com* faces more direct competition with the American giant aiming at taking its distance from *Tinder*'s concept while still offering its dating service for free.

However, it must be taken into account that apps such as *Match.com* and *Tinder* belong to the same group, the *Match Group*, itself owned by *IAC*. Therefore, such clashing concept may be combined in a common corporate strategy. In an article published in *Wired Magazine*⁴¹⁹⁰, Jeff Guibard reacts to the controversy that surrounded *Tinder* after it was sued for implementing 'ageist' measures (the platform decided to charge people over

4187 D. Priftis. 'Monetization models in dating apps – it's a match' (February 2019, Pollfish). <https://www.pollfish.com/blog/app-monetization/monetization-models-in-dating-apps%E2%80%8A-%E2%80%8Aits-a-match/>

4188 L. Nissen. 'Dating in the 21st century: How social media influences relationships on the example of *Tinder*' (August 2017, Duffy Agency). <http://duffy.agency/brandbase/dating-in-the-21st-century-how-social-media-influences-relationships-on-the-example-of-tinder/>

4189 L. Nissen. 'Dating in the 21st century: How social media influences relationships on the example of *Tinder*' (August 2017, Duffy Agency). <http://duffy.agency/brandbase/dating-in-the-21st-century-how-social-media-influences-relationships-on-the-example-of-tinder/>

4190 Jeff Gibbard. 'No, *Tinder*'s pricing is not ageist. It's capitalist' (*Wired Magazine* – November 2015). <https://www.wired.com/2015/03/tinder-is-capitalist/>

30 a higher price)⁴¹⁹¹. His theory is that this decision was a way to draw away users that were willing to put money in the process of online dating, namely older people, from *Tinder*. Even though it seems counter-productive in the first place, this decision could be a smart way to shift these older users towards more serious sites such as *Match.com* and *OKCupid*, since they are part of the same holding.

When it comes to specific pricing model, *Tinder* uses the freemium model. With an average time of 90 minutes a day spent on dating apps, the potential for revenue is huge within the dating sphere.⁴¹⁹² This model gives users access to the basic functionalities of the app for free. While the app generates, in the first place, a weak percentage of its revenues through advertising, it then starts making more money thanks to a system of premium subscription. Users, who first accessed the platform for free, can shift to an enhanced version of the service for a fee. New features include an add-free interface, the possibility to see which users already liked the subscriber's profile etc. *Tinder's* paying user base in 2018 was 4.1 million people achieving revenues of \$800 million⁴¹⁹³.

1.4.4. Needs and barriers

As part of the *Match Group*, *Tinder* is subject to domestic and foreign laws that affect online companies in general. The *Match Group* itself recognises that it is exposed to negligence, various torts and trademark and copyright infringement⁴¹⁹⁴. It is also subject to actions regarding the capture and collection of data. As *Tinder* and other dating apps collect an important amount of data, they must abide by different laws and regulations that apply in the field of privacy and protection of personal data. Such regulations prove to be particularly burdensome in western countries. In EU Law, the General Data Protection Regulation entered into force on May 2018⁴¹⁹⁵. It must ensure that all citizen of the EU and the European Economic Area have data and privacy protected. This legislative act gives the subject to give and revoke his consent at any time when it comes to processing his own data. In the US, no legislation that specifically infringe unlawful data processing exists but privacy statutes are meant to protect citizen from abusive behaviour from platforms.

Amongst the legal proceedings that the Match Group has had to deal with, one has directly involved *Tinder*. The platform has indeed been challenged by Consumer Class Action in regard of its Age-Tiered Pricing⁴¹⁹⁶. After winning the case in first instance, *Tinder*

4194 Match Group Inc (February 2019) 2018 10K form. <https://www.sec.gov/Archives/edgar/data/1575189/000157518919000020/match10-k20181231.htm#s7B9DF065D554FC5E4E9208A3ADBD02D6>

4195 Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data (2016)

4196 Allan Candelore v. *Tinder, Inc.*, No. BC583162 (Superior Court of California, County of Los Angeles)

had to go to the Court of Appeal and then the Supreme Court. If the case has not yet been solved, Tinder claims that the decision of the Superior Court of California, which ruled that age-based pricing differential for Tinder Plus subscription did not violate the law, must be upheld. The platform and the court argued that people under 30 belong to a group with more limited financial means.

Match Group has been brought before court by Bumble in Texas as it was accused of wrongfully obtaining confidential information with the plaintiff⁴¹⁹⁷. Prior to this proceeding, Tinder had tried to acquire Bumble through Match Group, its parent company. If the case is not solved yet, Match Group has, amongst other complaints, accused Bumble of using Tinder swiping trademark.

Another recent case has involved Tinder. This time, it opposed the dating platform with its parent company⁴¹⁹⁸. The complaint states that in 2017 Match Group and IAC made an independent assessment of Tinder valuation through investment banks that led to an undervaluation of the company therefore conducting to the underpayment of Tinder stock options. The New York state court must rule in the course of 2019.

1.4.5. Conclusion

Tinder's success has been built on the platform's ability to attract consumers in search for a more entertained-centred experience. By creating a user-friendly interface, the company has managed to take the lead in the innovation process. Since its launch in 2012, it has steadily extended its market share to become *Match Group's* most lucrative app, therefore dominating the whole online dating market. In the meantime, *Tinder* has developed a singular governance model to frame its relationships with users. Indeed, unlike *Amazon*, *Google* or *Airbnb*, the dating app does not provide a platform for other businesses but directly offers its service to consumers instead. Its contractual governance model therefore focuses on a bilateral agreement with users⁴¹⁹⁹. As the emphasis is put on P2C relations, informal and technological models of governance mainly structure how the platform is perceived by consumers while contractual governance seeks to legally protect the platform from users' complaints. If such contractual relation sparked privacy concerns⁴²⁰⁰, with institutions such as the *European Commission* denouncing abusive clauses, the platform has showcased its ability to innovate and a strong communication to preserve its image.

1.5. Sberbank^{4201*}

1.5.1. Nature of the competitive game

PJSC “Sberbank” is the large state-owned Russian financial institution, whose 50%+1 voting share is owned by the Central Bank of Russia.⁴²⁰² It is currently the largest bank in Russia occupying a share by assets of more than a third of the Russian financial market and about a half in most retail banking businesses.⁴²⁰³

It has been always perceived as a conventional banking institution, though highly reliable in terms of stability. However, lately Sberbank has exhibited a decisive move to transform into a modern, digital ecosystem comprising non-financial services, along with its traditional financial products.

After Herman Gref became Sberbank’s CEO in 2007, Sberbank has started digital transformation along two lines. First, it transformed its traditional financial lines of business in order to provide services through remote and digital channels in a more efficient way.⁴²⁰⁴ Second, since 2013, it has started expansion into the new markets: online payments (Yandex.Money, 2013); targeted online advertisement (Segmento, 2015); cybersecurity (BISon, 2016); automation of business processes (Evotor, 2016); healthcare online platform (DocDoc, 2017); biometric identification (VisionLabs, 2017); real estate (DomClick, 2017); telecommunications (Sbermobile, 2017); e-commerce (Yandex.Market, Beru.ru, Bringly.ru, 2018); cloud services (SBCloud, 2018); corporate messenger service (Dialog Enterprise, 2018); business outsourcing and optimisation (Intercomp, 2018), and others.⁴²⁰⁵ In each of these adjacent markets, Sberbank sought to leverage its large customer base, access to capital, strong brand recognition, and developed technological expertise in order to create a ‘first mover’s advantage’ and harness network effects. In 2017, Herman Gref declared a new development strategy for 2018-2020, according to which by 2020 Sberbank should be transformed into a universal technological company, whose competitors would be Google, Amazon and Alibaba, not just banks.⁴²⁰⁶ The strategy aims to achieve almost total technological leadership and underlines the need to create an ecosystem for the convenience of the bank’s clients.⁴²⁰⁷

4205 See the annexed Table on Sberbank’s Merger Activities.

4206 *ibid.*

4207 ‘The Sberbank Development Strategy 2020’ <https://www.sberbank.ru/common/img/uploaded/files/sberbankdevelopmentstrategyfor2018-2020.pdf> accessed 27 May 2019.

The peculiarity of Sberbank's ecosystem is that, unlike, for instance, Google or Facebook, it started as a traditional institution based on the pipeline business model and then embarked on the task of transforming into the digital ecosystem. It involves specific challenges and limitations related to dealing with legacy systems and business models. In addition, being the largest bank in Russia, it needs to preserve stability of the core business, while venturing into the new areas.

The following sections outline the private governance model employed by Sberbank towards its ecosystem.

1.5.1.1. Ecosystem: The Rationale of Creation and Key Elements

Sberbank's move to create a digital ecosystem has several reasons behind it. The first reason is profit generation. Sberbank declares that the goal of digitalization is to increase the market capitalisation of the company (allegedly from \$60 bln to \$200 bln.).⁴²⁰⁸ This is not surprising, as technological companies have the highest market cap compared with more traditional, product-oriented business. Therefore, transformation into the digital platform is going to increase Sberbank's market capitalisation and profitability.

Second, Sberbank has been facing competitive pressure from more innovative financial institutions which have entered the market relatively recently (like Tinkoff or Rocketbank).⁴²⁰⁹ These competitors use the digital platform model by combining financial and non-financial products to increase customer engagement and they are highly popular among millennials. Banks also feel increasing pressure from non-financial companies – the Big Tech firms (Amazon, Google, Apple, Alibaba, etc.) that strive to lock up customers in their ecosystems by providing them the whole range of services including financial products. Thus, the defensive strategy chosen by Sberbank might be the only way to preserve its leading position in the market of banking products in Russia.

During last couple of years Sberbank has been actively penetrating in the whole array of non-financial sectors including e-commerce (joint venture with Yandex.Market), health-care (Doc.Doc), real estate (DomClick), telecommunications (Sbermobile), cloud technologies (Sbercloud), mobile payment and restaurant loyalty system (Plazius), biometric identification (VisionLabs). Some of the products have been developed by Sberbank in-house, while others were acquired through M&A transactions (see annex). To date, its most ambitious project has been launching two marketplaces together with Yandex.Market – Beru and Bringly – to compete with foreign marketplaces such as Aliexpress.⁴²¹⁰ In the development of its ecosystem Sberbank seeks to leverage the data about cus-

4208 Anna Tretyak, Anna Yeremina 'Why Does Gref Want to Turn Sberbank into an IT Company?' *Vedomosti* (Moscow, 16 December 2018) <https://www.vedomosti.ru/finance/articles/2018/12/16/789410-gref> accessed 25 May 2019 accessed 25 May 2019.

tomers transactions in its possession in order to identify the most pressing needs of its clients through their daily expenditures.⁴²¹¹ To better understand the clients and make personalized offers, Sberbank seeks to extend channels of getting the data about its customers. This might be the rationale of its latest acquisition of Rambler Group active in web search and content services.⁴²¹² Combination of bank transactional data and data about customers' online behaviour might further entrench the Sberbank's position as the emerging powerful ecosystem.

Apart from developing the ecosystem for individuals, Sberbank aims to develop the comprehensive ecosystem for SMEs. This includes various companies for optimisation of business processes (Evotor and Intercomp), targeted online advertising (Segmento), and an online supermarket for SMEs which currently includes 24 non-financial services.⁴²¹³

1.5.1.2. Towards the Sberbank Technological Platform

Sberbank has often voiced an opinion that a proprietary technological platform laid the foundation of the successful ecosystem.⁴²¹⁴ By 2020 Sberbank plans to introduce the new technological platform, where all existing clients, products and services will migrate.⁴²¹⁵ The new platform will be based on the innovative cloud infrastructure and will provide API-services for all partners and key elements of ecosystem. To implement effective technological government of its ecosystem, Sberbank plans to introduce DevOps⁴²¹⁶ practices and tools increasing the speed of creation and update of services and applications. When implemented, this will create the thriving environment for developers of various applications to plug into Sberbank platforms and reach the clients.

According to Sberbank, the partners plugging into the Sberbank ecosystem will get access to the customer database amassed by Sberbank and technological capabilities of the platform (including client identification, quick data sharing, etc.).⁴²¹⁷ The platform will provide the ground for competition between internal and external products.⁴²¹⁸

Source: FutureBanking⁴²¹⁹

On the customer side, the platform will provide:⁴²²⁰

- Integration of all the processes of end-to-end interaction from and to the client;
- Providing the omni-channel client experience: a client can get any services or continue any operation regardless of the channel where it has been initiated. The client can also get customised offering based on its preferences through any channel.

Apart from this, Sberbank actively invests in the cutting-edge technologies (AI, blockchain, robotics, Internet of Things) with a view to embedding these solutions into the Sberbank's platform and securing its unassailable technological advantage.⁴²²¹

To summarise, implementation of the technological platform by Sberbank will give the latter an opportunity to manage all interactions between customers and service providers comprising its ecosystem. We have not found exact information about monetisation of the platform, but according to Herman Gref, the period of ROI for the platform is estimated as three-four years, which might indicate the high rate of its profitability.⁴²²²

1.5.2. The Particles of the Sberbank Digital Ecosystem

Sberbank and Yandex, the Russian largest technological firm, collaborate on a number

⁴²¹⁹ Future Banking, 'From bank to technology company. How does the new Sberbank platform work?' (11 December 2017) <http://futurebanking.ru/post/3508> accessed 27 May 2019.

⁴²²⁰ 'The Sberbank Development Strategy 2020', 29.

⁴²²¹ Sberbank, 'Annual Report 2017', 112.

⁴²²² See "Financial Service is Always Intermediate: Money is not for the Sake of Money" Kommersant (Moscow, 08 June 2018) <https://www.kommersant.ru/doc/3651770> accessed 27 May 2019.

of e-commerce projects. In August 2017, the two companies signed a binding letter of intent that laid down the terms for a joint venture Yandex.Market,⁴²²³ which had been previously a part of the Yandex.Group. According to the available information, Sberbank acquired Yandex.Market's shares valued at 30 billion rubles. Upon the acquisition, the overall stock capital was divided equally between Yandex and Sberbank with 10% of the shares forming an option fund for the employees.⁴²²⁴ Currently, Yandex.Market runs two online marketplaces – Beru and Bringly, as described below.

1.5.2.1. Beru.ru and Bringly.ru: Private Governance Forms

Beru.ru is a marketplace which offers a variety of consumer goods in electronics, beauty and health, sports, etc. and operates within the domestic market.⁴²²⁵ Sberbank and Yandex launched Beru in May 2018 in beta,⁴²²⁶ and in October 2018 Beru became available for public.⁴²²⁷

Bringly.ru was launched by Sberbank and Yandex in 2018. In contrast to Beru.ru, Bringly.ru is a cross-border e-commerce service that offers goods delivery from abroad. The companies' representatives said in the context of the deal that the combination of Sberbank infrastructure for payments and lending for buyers, and Yandex technologies, such as platform API, would help them develop the e-commerce ecosystem in Russia.⁴²²⁸

Because Beru.ru and Bringly.ru deploy similar business models, the analysis of the private governance regimes (technical, soft and contractual) applies to both platforms. In case of Beru.ru more information on contractual governance is available in the public domain than for Bringly.ru.

1.5.2.1.1. Contractual governance

1.5.2.1.1.1. Relationships with customers

The main document governing contractual relationships of Beru.ru and Bringly.ru (each referred to as '**platform**') with their customers is the Terms of Use that are identical for both marketplaces.⁴²²⁹ The Terms of Use are concluded between Yandex.Market, LLC

4229 Beru's Terms of use at https://yandex.ru/legal/beru_termsofuse/ accessed 17 June 2019. Bringly's Term of use at https://yandex.com/legal/bringly_terms_of_use/ accessed 17 June 2019.

(‘**Yandex.Market**’) providing the services of the marketplace and users of the platform and contain the following provisions:

General – relationship

The Terms of use provide Yandex.Market with quite broad rights with regard to materials posted by users on the platform (e.g. sales ads, graphics, reviews of goods). The Terms emphasize that Yandex.Market can repost such reviews and graphics on the third party’s resources (section 2.3.). Yandex.Market and YANDEX LLC can use materials posted by users on other platforms and in other applications for advertising and marketing purposes, for instance, to increase user engagement with other applications and services of Yandex.Market and YANDEX LLC (sections 2.4, 2.5).

Yandex.Market has the right of censorship with respect to some materials defined in the Terms (e.g. reviews not relevant to the goods or sellers, not based on the actual use of the goods, insulting reviews, etc.) (section 2.6). Yandex has the right to delete any review or materials at any time.

The user concludes a direct sales agreement with the actual seller of goods (section 3.2). Yandex.Market offers information services and does not participate in the relationship between the user and the seller (section 3.7). However, Yandex.Market acts as the seller’s agent when processing user’s payments for orders through the platform (section 5.2).

Yandex.Market may unilaterally change the Terms of Use at any time without notification of the buyer (section 9.2.3). For examples, Yandex.Market may change a list of third parties to whom it may transfer the buyer’s personal data (section 3.8).

Yandex.Market has the right to transfer the buyer’s personal data to third parties (section 3.8). By accepting the Terms of Use, the buyer agrees that Yandex.Market can transfer his personal data to third parties, and no additional consent is required to each instance of such transfer. Thus, the buyer’s data may be transferred to:

- Sberbank (to offer and provide the buyer with Sberbank’s personalized services);
- Yandex (to improve services of the marketplace and other Yandex services);
- the Seller of goods with whom the buyer entered into an agreement with;
- the Supplier of goods (delivery to the buyer);
- the Companies that process payments.

Handling of complaints and Liability

Yandex.Market introduces the dispute resolution mechanism for resolving disputes between buyers and sellers (section 7). It also may act as an arbitrator (section 7.4) if the buyer and the seller cannot settle the dispute, but Yandex does not have any obligations with respect to the quality of goods or the seller’s failure to comply with its obligations. The arbitration clause is not exclusive.

1.5.2.1.1.2. Relationships with partners

Beru offers sellers two models of partnership: 'shop window + fulfilment' and 'shop window + delivery'.⁴²³⁰ Under 'shop window + fulfilment', the seller uploads the catalogue of goods with prices and delivers goods to Beru's warehouse. Beru provides the following paid services: placement of the seller's goods on the platform, online facilities to conclude a sales agreement, processing of buyer's payments, storage, packaging, delivery and handling of returns. Under 'shop window + delivery', which is a new model offered by Beru, Beru manages all relationships with customers, placement of goods on the platform, and delivery, while the seller provides storage, packaging and transfer of the goods to Beru's carriers. This involves the exchange of data between the platform and a seller through a private API.⁴²³¹ The new models likely means moving to the more profitable ecosystem with commoditization of services provided by partners (as all customer relations are now locked into platform).

Unlike Bringly, Beru gives public access to the contract templates that govern its relations with the sellers of goods. Those include a service agreement⁴²³² and a marketing agreement,⁴²³³ as summarised below. The platform imposes a marketing agreement on the seller in order to allow the seller to operate on the Beru platform.

- The seller must comply with the Beru Marketing Agreement to keep in force any agreements with Beru.ru (p. 2.4.1 of the Service Agreement).
- In case the seller does not comply with or terminates the Marketing Agreement, Beru terminates any agreements with the seller (p. 9.2 Service Agreement, p. 6.8 Marketing Agreement).

Obligatory discounts as a condition of participating in Beru's marketing campaign

- The seller must provide the buyer with discounts on its products participating in the loyalty program and Beru compensates the seller for the discounts provided (p. 3.2.1 and p.3.1.3 of the Marketing Agreement).

The Platform has the right to unilaterally change the terms of the agreements.

Service Agreement

- The Platform has the right to unilaterally change terms of agreement with sellers including the fees upon notification (p. 10.3, p. 2.2, Annex 2, p. 16, Annex 3).

4230 'Model 'shop window+fulfilment' <https://yandex.ru/support/marketplace/fulfillment/about.html> accessed 14 June 2019; 'Model 'shop window + delivery' <https://yandex.ru/support/marketplace/delivered-by-beru/about.html> accessed 14 June 2019.

4231 <https://yandex.ru/promo/marketpartner/beru> accessed 14 June 2019.

4232 Service agreement template slightly differs for 'shop window + fulfilment' https://yandex.ru/legal/beru_service_agreement/ accessed 15 May 2019, and for 'shop window + delivery' https://yandex.ru/legal/beru_service_agreement_2019/ accessed 15 May 2019.

4233 Beru marketing agreement https://yandex.ru/legal/beru_marketing_agreement/ accessed 15 May 2019.

- If the seller does not agree to the changes, the seller has the right to terminate an agreement with Beru.ru upon 15 days prior notification (p. 10.4).

Marketing Agreement

- The Platform has the right to unilaterally change the terms of the agreement (p. 6.3), including compensation for the mandatory discounts provided by sellers (p. 4.2) upon notification of the sellers.
- The Platform does not guarantee the display of the seller's items, even though the seller may store items at the Platform's warehouse and pay a fee for it
- According to the Service Agreement, the Platform has the right, but not the obligation, to display items of sellers (p. 1.2, Annex 1). The Platform chooses items to display according to the criteria set by the Platform – not disclosed (p. 1.3, Annex 1).
- The Platform has the right not to display the item if its price is 30% higher than the median price according to Yandex.Market statistical data (p. 1.9, Annex 1).⁴²³⁴

The platform may transfer the seller's data to third parties According to the Service Agreement, the Platform might transfer to Sberbank and Yandex the following seller's data upon the seller's prior explicit consent (non-exhaustive list, p. 8.8.2):

- data on the seller feedback on the offers of products and services of Sberbank and Sberbank affiliates;
- analytical data on the seller's turnover (Gross Merchandise Value);
- analytical data on the seller's average check;
- analytical data on the assortment of the goods;
- contacts and other details of the seller.

Purposes for the seller's data transfer to Sberbank and Yandex are the following (p. 8.8.1):

- Increasing efficiency and improve the quality of Sberbank and Yandex services;
- developing new products and services of Sberbank and Yandex;
- tracking the activity of the seller for statistical and other studies;
- creating and maintaining mathematical models (demand, propensity to purchase and / or outflow, etc.) using machine learning algorithms;
- preparing a sample of data for organizing the marketing communication of Sberbank or Yandex.

To summarize, Beru has the right to unilaterally change an agreement with sellers and buyers and decide whether to display seller's goods. The platform also significantly limits its liability towards the buyer for implementation of the sales contracts. Moreover, both Beru and Bringly have vast rights related to collection and transfer of the buyer's

⁴²³⁴ Beru Median Price Calculation Agreement regulates pricing procedure, https://yandex.ru/legal/beru_average_price_calculation/ accessed 15 May 2019.

and seller's data, with sellers subject to more favourable terms (explicit consent to each transfer). Both platforms may transfer the buyer's data to third parties, including Sberbank and Yandex, based on the generic consent that the buyer gives when accepting the platform's Term of use, thereby limiting the buyer's ability to control the use of his data.

1.5.2.1.2. Soft governance

Beru stimulates users' engagement via loyalty and bonus programs. For example, under the bonus program,⁴²³⁵ Beru provides bonuses for each purchase, and the buyer may use bonuses as discounts on the next purchases. Under the loyalty program,⁴²³⁶ Beru's partners provide bonuses for buyers. For example, Sberbank provides the buyer with Sberbank's bonuses if the buyer makes payments using a Sberbank card. Bringly also offers a similar loyalty program.⁴²³⁷

1.5.2.1.3. Technological governance

Bringly.ru and Beru.ru are based on a similar technological solution. Yandex.Market is responsible for the general functioning of the service and provides the original marketplace as well as the technological maintenance of the platform.

As for Sberbank, it provides the payments infrastructure to the platform, including crediting customers.⁴²³⁸ Thus, Sberbank uses the marketplace as another option to attract more clients to the banking services it offers.

1.5.2.2. DocDoc Telemedicine Platform

DocDoc is a Russian online service that serves as an example of telemedicine platforms. The platform offers a range of services that include searching for a healthcare professional according to the indicated problem or diagnosis, making appointments with a healthcare facility directly via a smartphone application and receiving online consultations from healthcare professionals. The service self-identifies as a marketplace for healthcare products.⁴²³⁹

DocDoc was initially launched in 2011 under the name of "Infodoctor" and followed a search tool model of a US project "ZocDoc".⁴²⁴⁰ Later in 2013, "DocDoc" was re-launched

under its current name by one of the developers of the original “Infodoctor” platform.⁴²⁴¹ As of August 2014, “DocDoc” occupied over 50% of the online healthcare appointments market in Moscow.⁴²⁴²

Sberbank acquired 80% of shares in the platform in 2017 and, thus, included it into its emerging ecosystem.⁴²⁴³ While the value of the deal has not been disclosed, the company’s value as of the date of its acquisition by Sberbank was approximated at around 1.5 billion rubles.⁴²⁴⁴

When officially disclosing the acquisition of DocDoc, Sberbank’s representative mentioned the importance of the deal for the creation of Sberbank’s digital ecosystem.⁴²⁴⁵ Sberbank’s probable aim was to combine various personalized services in its ecosystem and increase the client loyalty.

1.5.2.2.1. Contractual Governance

“DocDoc” LLC, acting as an independent entity, enters agreements that govern its relationships with clients and healthcare services providers.

Collection of Personal Data

The company’s policy on personal data is established in the publicly available Rules on Personal Data.⁴²⁴⁶ The company has no right to collect health data meaning information on the users’ health as well as data on “intimate life” (section 2.4). The company stores users’ personal data in the electronic database (section 3.1) and, apparently, owns the user database. The company may only share this data for the purposes set in the Consent form on personal data processing,⁴²⁴⁷ for instance, with a healthcare facility where a user requested an appointment.

1.5.2.2.1.1. Relationship with users

Relationship with users is governed by the customer agreement published on the “DocDoc” website⁴²⁴⁸ concluded between DocDoc (**Administrator**) and the user.

4241 *ibid.*

4248 DocDoc Customer Agreement <https://shop.docdoc.ru/offer> accessed 15 May 2019.

Some services “are only available to users when the Administrator concluded agreements with the partners/providers on provision of these services to such users” (section 3.2.). However, section 3.5.2 states that it is the responsibility of the user to familiarize oneself with the terms of services and contracts concluded between the user and the service provider.

The Administrator only assists the users in concluding agreements with the respective service providers but does not participate in the actual provision of services (section 6.1).

Payments

The Administrator is authorized to accept payments from users and transfer these payments to the service providers (section 5.3) acting as an agent on behalf of the service provider.

The Administrator does not have any obligations under the User-Provider contracts and is not responsible for the providers’ performance of these contracts (section 5.6).

Limitation of liability

According to section 6 of the customer agreement, the Administrator does not bear responsibility for the actions of any third parties with whom the users interact while us

ing the services and the web-site in general and does not reimburse for damages stemming from disputes between the users and their counterparts. Furthermore, section 6.3 states that in any event, should the Administrator’s guilt be proven, the Administrator’s liability is strictly limited to 1000 rubles.

1.5.2.2.1.2. Relationship with service providers

License Agreement

As for relation with healthcare service providers, “DocDoc” acts as a licensor while a service provider acts as a licensee (sections 1.1.1 and 1.1.2).⁴²⁴⁹ The licensor grants the license to the licensee and the licensee pays for the license that allows to post information about the licensee on the “DocDoc” website and to receive orders from the clients using the service (section 2.1.).

The licensor does not guarantee the precise placement of the information about the licensee in the web-site catalogue as well as the presence or absence of clients’ reviews including the absence of the negative reviews (section 2.8).

The licensor retains the right to delete any information on the licensee in a number of cases (e.g. the licensee violates the License agreement or provides false information or

⁴²⁴⁹ DocDoc License Agreement, <https://docdoc.ru/oferta/DDOfertaVrach.pdf> accessed 15 May 2019.

receives too many negative reviews from clients – section 2.8).

Accountability

The licensor cannot guarantee the accuracy of the information posted on the platform (though it undertakes measures to exclude false or illegal information), while the licensee guarantees the accuracy of all materials posted and that their use does not infringe IP rights of third parties (sections 5.3-5.4).

Service Fees

“DocDoc” does not require fees for publishing information about its licensees and collects payments only when an appointment is made through the service. The payment is calculated based on the price of the client’s request and the overall number of requests and depends on the tariff plan chosen by the licensee (section 4.4.) and on the actual use of the service by the licensee in a given period of time (section 4.1).

1.5.2.2.1.2.1. Soft Governance

The main mechanism of the soft governance involves reviews from clients about the healthcare facilities and doctors that clients have found on the DocDoc. These reviews are posted on the web-pages of every clinic and doctor that uses “DocDoc” to arrange medical appointments. The importance of the review mechanism is underlined by the special provisions of the License agreement described above.

1.5.2.2.1.2.2. Technological governance

Technologically, “DocDoc” offers a set of software algorithms that facilitate the provision of healthcare services. These algorithms allow to post information on the “DocDoc” website and process requests for medical appointments directly to the partner healthcare facilities.

Consequently, by acquisition of “DocDoc”, Sberbank acquired its technological solution. However, there is no available information whether some of the services offered by “DocDoc” were created by, or in cooperation with, Sberbank and whether it will be plugged in into the Sberbank’s single technological platform.

1.5.2.3. DomClick: Private Governance Forms

In the beginning of 2017, Sberbank launched DomClik, an internally developed online platform intermediating the process of buying residential property.⁴²⁵⁰ On this platform a user can apply directly for mortgage in Sberbank, choose the property, formalise all legal documents for purchase, including sending an online application to Rosreestr

⁴²⁵⁰ Igor Chubaha, ‘Is Sberbank Monopolising the Real Estate Market?’ (15 March 2017) <https://www.bn.ru/gazeta/articles/237778/> accessed 29 May 2019.

(The State Register of Rights to the Real Estate Objects) and execute the electronic payment.⁴²⁵¹

The Sberbank's proposition was innovative as it allowed to buy the property online and, as Herman Gref claimed, to dramatically reduce the agency and legal fees.⁴²⁵²

Initially, the platform was open only to professional market players (property developers and real estate agencies). Since May 2018, individuals can also post ads on DomClick.⁴²⁵³

1.5.2.3.1. Contractual governance

All agreements with users of the platform and its partners are concluded by the "Real Estate Center of Sberbank" LLC, a full subsidiary of Sberbank, PJSC.⁴²⁵⁴ The contractual governance of the platform encompasses several legal agreements binding partners, sellers, buyers, and borrowers using the platform DomClick.ru ('**Platform**'). These include the personal data policy, customer agreement for DomClick.ru, terms of use of a personal account and terms of use of the agent system for transmitting documents via electronic communication channels.⁴²⁵⁵

The analysis of these contractual terms reveals that they grant the Platform quite broad rights and contribute to entrenchment of its power over users on both sides of the Platform (sellers and buyers of the property). These terms refer to:

1.5.2.3.1.1. Provision granting Platform the right over the content supplied by its users.

According to the customer agreement all information uploaded to the portal constitutes the database. IP rights to this database belong to the Licensor (the Platform) (p.2.10). According to the customer agreement the Licensor gives users access to the portal DomClick.ru. Upon registration of the personal account, the user becomes a Client and has access to any services delivered through the portal. The Client is granted the right to use the Licensor's intellectual property (the software and the database) and can extract information from the database only for personal non-commercial purposes and (or) for execution of transactions by the Client (p.4.1.2). The Partners (real estate agencies) provide the Platform with the information about their real estate objects based on the non-exclusive, free of charge license (p.2.14, 3.2.1.) as well as the right to use their trademark (p.3.2.2.). The right of extraction of information from the portal by the Partners to use in their commercial activity is regulated by a separate agreement between the Licensor

4251 Sberbank, 'Sberbank Real Estate Center, LLC' https://www.sberbank.ru/ru/about/company_partner/domclick?_ga=2.48101031.1074118979.1557779952-885413753.1557779952 accessed 30 May 2019.

4252 Igor Chubaha, 'Is Sberbank Monopolising the Real Estate Market?' (15 March 2017) <https://www.bn.ru/gazeta/articles/237778/> accessed 29 May 2019.

4253 Sberbank Press release, 'DomClick Launched a Service Accepting Ads from Individuals and Offered a Mortgage Discount for Buyers' (08 June 2018) https://www.sberbank.ru/ru/press_center/all/article?newsID=b563d163-a413-42abad91-27fade1a91b6&blockID=1303®ionID=77&lang=ru&type=NEWS accessed 30 May 2019.

4254 Abstract from the State Register of the Legal Entities as of 05 July 2017, https://www.sberbank.ru/common/img/uploaded/files/pdf/domclick_egrul.pdf accessed 07 June 2019.

4255 For the templates of the documents see <https://domclick.ru/terms.html> accessed 29 May 2019.

and the Partner (p. 4.2.2. – not available in the public domain). In addition, the Platform can delete the information posted by any user without notice on the number of cases (p.8.3, 9.2.10). It is explicitly prohibited to use the specialized software (scripts, robots) to scrape the information contained in the Portal (p.10.2.18).

1.5.2.3.1.2. The right of the Platform to transfer the users' personal data to third parties

The Agreement on the Use of the Personal Account (Buyer, Seller, Partner):

The platform operator can transfer personal data of the user to a third party, *inert alia*, if the transfer of personal data is necessary to provide various types of services (without the explicit user's consent, because transfer of the personal data subject to the user's consent is indicated as a separate occasion of the transfer) (p. 5.2).

The Personal Data Policy and the Form of Consent for Processing of the Personal Data⁴²⁵⁶ states that the Platform needs the user's consent for processing his personal data (including credit history and sources of income), which consent is given for the following purposes:

- posting ads for the sale of real estate;
- sending information about the products and services of the Operator;
- processing incoming requests for a mortgage;
- information exchange between the Operator and the bank / developer / investor / seller / buyer / realtor / (hereinafter – Partner), with the right to transfer information to insurance and appraisal companies with which the Partner has agreements;
- performance of obligations under the contract concluded with the Operator and / or Partner;
- analytics of the user behaviour on the website and for sending the updates.

1.5.2.3.1.3. The right to modify the terms and content of the services provided on the Platform unilaterally or block the access to them

According to the Customer agreement:

- The Licensor may at any time amend the terms of service, modify, restrict, expand the functionality of the Platform, including the terms of the User access to the Services (p.3.1.);
- The Licensor has the right to change the requirements for the content and (or) conditions for placing advertisements on the Portal by amending the Agreement (p.8.6.2);
- To prevent violation of the terms of the Agreement or causing damage to the Portal..., the Licensor has the right to restrict the User or third party's access to the Portal (p.9.2.9).

⁴²⁵⁶ DomClick Personal Data Policy, <https://domclick.ru/fs/public/docs/privacy.pdf> accessed 18 June 2019.

According to the Terms of Use (with Partner, Buyer, Seller):

The operator of the Platform has the right to:

- monitor the user's actions in the Client's Personal Account;
- restrict the user access to information systems connected to the Client's Personal Account, including by blocking the account user;
- change the terms of use of the Client's Personal Account without prior notice to the user (p.4.1).

1.5.2.3.1.4. Imposing the form of the contract

When the Partner uses the Platform in the Client's interests to apply for a mortgage in Sberbank, the Partner undertakes to conclude an agreement with his client in the form recommended by the Licensors (the Platform) (p. 10.2.19 of the Customer agreement).

1.5.2.3.1.5. Limitation of liability and limited guarantee of the Platform**Customer agreement sets forth:**

- Limited guarantee regarding the accuracy of information and delivering of the services (section 11);
- The Licensors shall not be liable for losses incurred by the User as a result of the use of the Portal (p. 14.2);
- The Licensors are not responsible for the content and presentation of information posted by the User on the Portal (14.3).

To summarise, the contractual terms offered by the Platform allow the latter to get hold of the data uploaded to Platform with limiting clients' and partners' further use of such data. This potentially creates a data advantage for the Platform in the market of the real estate services. This is exacerbated by bundling the Platform's services (search for and evaluation of the property, etc.) with the Sberbank's products (retail mortgages). To lock in the customers within the Platform, Sberbank also offers discounts for mortgages when applied via DomClick – 0.3%.⁴²⁵⁷ This generates two cash flows for Sberbank: first, commission fees from the services performed by the Platform; and second and more important, from increased sales of its financial products to the Platform users.

1.5.2.3.2. Soft Governance

To increase the clients' loyalty, DomClick has launched many initiatives aimed at building community around the Platform and rewarding the active engagement in it. For instance, in March 2019, DomClick offered realtors participating in the Platform opportunity to leave reviews of the property where they have sold an object.⁴²⁵⁸ The realtors

⁴²⁵⁷ <https://blog.domclick.ru/post/novye-pravila-polucheniya-skidki-0-3-na-stavku-po-ipoteke-dlya-kvartir-na-domklik>

⁴²⁵⁸ <https://blog.domclick.ru/post/aktivnye-rieltory-stanut-ekspertami-domklik>

that post regular reviews will be assigned the “expert” status that will further increase their credibility and engagement. As another example, in December 2018, DomClick launched the loyalty program for its partners where for every mortgage approved via DomClick the agency receives one point.⁴²⁵⁹ The number of points affects the placement of the company in the Platform’s interface, thereby increasing its brand recognition.⁴²⁶⁰ According to Sberbank, it even invites its partners to participate in the Expert council of real estate agencies in order to streamline the communications between real estate agencies and Sberbank.⁴²⁶¹

1.5.2.3.3. Technological Governance

The services of DomClick are offered through the technological platform owned by “Real Estate Center of Sberbank” LLC. This platform is integrated with Sberbank’s platform allowing the clients of DomClick to apply for and receive an approval of mortgage by Sberbank online. It is also integrated with the Rosreestr database which allows to submit documents to Rosreestr for registration of property rights⁴²⁶² and verify the property rights automatically.⁴²⁶³ In the future, DomClick potentially will become a part of the Sberbank technological platform (see “**Sberbank Technological Platform**” section).

1.5.3. Conclusion of the Case study

The Sberbank case study helps shed the light on how the governance regime of an ecosystem and, in particular, the platform at its center, affects the allocation of value capture. The Sberbank’s governance system centers on contractual governance, which limits the role of the platform to facilitating contracts between the end users and the sellers/service providers (e.g. sellers of goods on Beru.ru or real estate agencies on DomClick). In this regard, the platform seeks to limit its liability in front of its users and partners. On the other hand, Sberbank’s platforms aims at retaining decisive control over the use of the platform interface (the web site/marketplace) by ability to change the terms of display unilaterally, refuse the display of the goods/ads and to remove any content that the platform finds inappropriate. The ultimate goal of the platforms is to get hold of the customers and partner’s data and be able to share it with its affiliates to use it more efficiently in providing services and products in adjacent markets (e.g. Yandex.Market or DomClick have the right to transfer the user’s personal data to third parties without obtaining the user’s explicit consent every time). Obviously, the platform has ability to transfer the user’s data to its parent companies, Sberbank and Yandex to allow the latter to provide personalized services to the user. Thereby, the platform seeks to benefit from the virtuous circle of continuous improvement: better product attracts

4259 <https://blog.domclick.ru/post/teper-partneram-nachislyayutsya-bally-za-sdelki-po-kvartiram-s-onlain-odobreniem>

4260 *ibid.*

4261 Interview with Alexander Popov, Executive director of DomClick (31 October 2018) <https://blog.domclick.ru/post/kto-v-itoge-poluchit-vygodu-ot-domklik> accessed 30 May 2019.

4262 https://www.sberbank.ru/ru/fpartners/other_coop/ipoteka_coop/inform accessed 30 May 2019.

4263 *ibid.*

more users, which share more data with the platform, that, in turn, use this data to provide the better product and so on.⁴²⁶⁴ This allows Sberbank to capture more data and, as a result, more value from the whole ecosystem, also benefitting its own core business – financial services (e.g. DomClick does not just generate value as a real estate platform, but also channels clients to Sberbank mortgage products).

In its strategic documents, Sberbank puts emphasis on the technological governance. It aims to implement this governance through the single technological platform, where all the clients and partners will plug in. From the above analysis, we see that Sberbank seeks to get advantage of the big data amassed and of various technological capabilities to make its technological platform indispensable for the companies that want to enter certain markets and reach particular groups of users. It is still unclear how exactly Sberbank will implement the technological governance of its platform (e.g. what kind of technological standards, algorithms, etc. it will adopt) – this is subject to further monitoring and update.

1.6. Alibaba^{4265*}

1.6.1. Nature of the competitive game

While often being compared with Amazon, Alibaba and Amazon also differ in many aspects. Rather, Alibaba is likened to Amazon, eBay, PayPal, and Google all rolled into one. Founded by Jack Yun Ma in Hangzhou 1999, Alibaba has grown to be one of China's largest companies with massive influence in the world, and one of the frontrunners of the e-commerce companies.

Alibaba is reportedly to have 80% of the online retail sales in China by volume, and is also offering a suite of services from cloud computing, mobile media, entertainment to other developing initiatives.

Alibaba's long-term mission, as the company stated for itself, is to provide business with a comprehensive, all-encompassing platform that offers all the necessary infrastructure for e-commerce. According to the company's annual report, the vast majority of its revenue is generated from charging business to use Alibaba's infrastructure.

1.6.2. Alibaba's shareholding

Alibaba is a NYSE listed company since September 2014, it operates in China through a unique VIE structure (discussed below). The largest five outstanding shareholders as of May 2019 are:

⁴²⁶⁴ The virtuous circle of continuous improvement is described, for instance, in Andrew NG, 'AI Transformation Playbook' (2018) <https://landing.ai/ai-transformation-playbook/> accessed 20 January 2019.

⁴²⁶⁵ * Bowen Wang and the team of the University of Peking Internet Centre.

- Jack Yun Ma: Founder and chairman of Alibaba, holds 11.7% of the company's outstanding shares;
- Joseph Chongxin Tsai: Co-founder and vice chairman, holds 8.4% of the outstanding shares;
- Blackrock: a global investment firm, holds around 6% of shares;
- T. Rowe Price Associates: a US AMC, holds 5.3% of the outstanding shares;
- Baillie Gifford & Company: a Scottish PE house, holds 4.2% of the outstanding shares.

It is also worth noting that in the early days of Alibaba, the company is heavily invested by Softbank and Yahoo, the two was for a long time among the largest shareholders of the company.

1.6.3. Ecosystem and sibling companies

Alibaba has segmented its business into below the groups: Core Commerce, Cloud Computing, Digital Media and Entertainment, and Innovation Initiatives and Others.

- Core Commerce: which include its third party platform Taobao, its self-operating online market Tmall, its payment sibling company Alipay.
- Taobao (which in Chinese means "searching for treasure") is an online trading platform that hosts over 10 million active vendors and 400 million active buyers. Taobao is currently China's largest online trading platform. With respect to gross merchandise value (GMV), Taobao has surpasses eBay and Amazon combined in 2015.
- Cloud Computing: Alibaba Cloud, which offers elastic computing, database, storage and content delivery network, large scale computing, security, management and application, big data analytics, a machine learning platform, and other services provide for enterprises of different sizes across various industries.
- Digital Media and Entertainment: relates to the Youku Tudou and UC Browser business, also Alibaba's investment in Weibo, a social media platform.
- The Innovation Initiatives and Others segment includes businesses such as AutoNavi, DingTalk, Tmall Genie, and others

Below is a chart illustrates Alibaba's ecosystem:

1.6.4. Investment and M&As

Alibaba is also known for its active investment in the whole internet industry. Alibaba has a portfolio of investment approaching 400 companies, among which Alibaba focuses on assets that bring synergies and expand the Alibaba ecosystem.

To take a bite of Alibaba's investment, below is a list of the top 10 investment made by the company in 2017 alone, in terms of the deal value:

Target name	Transaction value	Jurisdiction	Transaction description
SUN ART	\$2.9 billion	China	Paying nearly \$3 billion for a one-third stake, Alibaba invested in Sun Art Retail, which operates several well-known supermarket brands.
INTIME	\$2.6 billion	China	Alibaba made its first serious push into brick-and-mortar retail back in early 2014 when it ploughed nearly \$700 million into department store and mall firm Intime.
TOKOPEDIA	\$1.1 billion	Indonesia	In August, it doubled down on its 2016 Lazada acquisition – which gave the Chinese firm an online shopping empire across much of Southeast Asia – by throwing a lot of money at Indonesian e-commerce app Tokopedia.
LAZADA	\$1 billion	Indonesia	Alibaba upped its stake in Lazada in April, paying an extra billion bucks to go from 51 to 83 percent.

Target name	Transaction value	Jurisdiction	Transaction description
ELE.ME	\$1 billion	China	China's growing hunger for food delivery led Alibaba to once again invest in Ele.me, which emerged as the leading meal-delivery app.
CAINIAO	\$799 million	China	Cainiao is Alibaba's logistics wing, running a network of warehouses and trucking partners.
OFO	\$700 million	China	Both Ofo and Mobike were bolstered by colossal funding rounds as they raced to expand overseas.
SOU CHE	\$335 million	China	Souche – literally “search car” in Chinese – lives up to its name as a search engine for secondhand car buyers.
YIGUO	\$300 million	China	Fresh foods app Yiguo operates in more than 200 cities across China, with those in some of the largest cities getting same-day delivery.
BIGBASKET	\$280 million	India	Over in India, Alibaba is in the late stages of a move to invest in groceries startup BigBasket.

1.6.5. Corporate organization information

1.6.5.1. VIE structure

In September 2014, Alibaba Group Holding Limited (Alibaba) successfully launched a \$25 billion initial public offering (IPO), the largest IPO ever, on New York Stock Exchange. Alibaba's landslide IPO success marked as another significant event of Chinese Internet companies' capital raise in the U.S. capital markets. However, just as most of the U.S. listed Chinese companies, Alibaba adopted a unique, but not typically well-comprehended control mechanism – the variable interest entity (“**VIE**”) structure.

The term of VIE originates from the U.S. accounting rules and is explored as a resort to circumvent restrictions on non-Chinese ownership of companies in sensitive sectors, such as telecommunication, education and the Internet.⁴²⁶⁶ The VIE structure allows flexibility in one hand for the foreign investors to subscribe shares in an offshore entity (which is typically a Cayman Islands or BVI shell company for tax and corporate governance purposes), and on the other hand for the company to circumvent foreign investment restrictions. While the shell company cannot operate in the restricted sector itself, it gives foreign investors access to revenues of the underlying company that does.

Conceptually, a VIE is an entity which is consolidated in to a listing company's financial books as the entity is “controlled through contracts, rather than ownership” by it.⁴²⁶⁷ To

⁴²⁶⁶ DAVID ROBERTS & THOMAS HALL, VIE STRUCTURES IN CHINA: WHAT YOU NEED TO KNOW, O'MELVENY & MYERS LLP RESEARCH REPORT: TOPICS IN CHINESE LAW 1, 4 (2011) (on file with the Brooklyn Journal of Corporate, Financial & Commercial Law).

⁴²⁶⁷ See Alibaba Grp. Holding Ltd., Amended and Restated Articles of Association 20 (2013) [hereinafter Alibaba Articles of

put it a different way, the listing company controls the underlying company (the operating entity) through contractual arrangements instead of concrete shareholdings. In the most commonly seen market practices, a VIE entity refers to the one incorporated in China which is in actual operation and is owned by the Chinese individuals (typically the founders). The VIE entity is a purely onshore entity which has no foreign shareholding, so it is permitted to conduct business in industries which is prohibited or restricted from foreign ownership in China.

In practice, a VIE involve a complex set of legal and financial arrangement to enable foreign investment. The offshore listing company incorporates a wholly foreign owned enterprise (“**WFOE**”) in China that generates revenues to the listing company through capturing the profits of the VIEs under a series of contracts. Among such contracts, there are typically: (i) a loan agreement capitalizing the VIEs and setting governance mechanisms; (ii) share pledge by the shareholders of the VIEs to the WFOE as a collateral security to the loan aforementioned; (iii) power of attorney by the VIEs and its owners to empower the WFOE attend and vote at VIEs’ shareholder meetings or board meetings; and (iv) a services agreement which essentially transfer the residual profits of the operating entities to the listing group in exchange of offering services such as training, administrative support and so forth.

Alibaba’s VIE structure is very much followed above the classic roadmap. American investors are not acquiring or holding shares of the operating entities, rather, they are the shareholders of the shell company. Such investors do not technically own shares in Alibaba, rather, they only have contractual rights to revenues generated by Alibaba. Alibaba’s VIE structure includes a loan, a technical service agreement, a proxy, a share pledge and an exclusive call option agreement.

While being a practical way to circumvent applicable domestic law restriction and is wildly accepted by the Internet sector, VIE itself is in no ways ideal and embedded with inherent risks. For instance, the offshore investors are exposed to risks where the company founders are somehow incentivized to renege on VIE contracts. The best example to establish the case also involves Alibaba. In 2010, Alibaba decided to spin-off its online payment business developed in house, Alipay as a response to the Chinese bank regulator’s requirement of domestic ownership. Alipay was devested as a separate legal entity, Ant Financial, which is also founded and owned by Jack Ma, the president and founder of Alibaba. Under Alibaba’s VIE agreements, the offshore investors, Yahoo for example, have no rights to block such a divestment. As such, the public investors are exposed under great corporate governance risks.

Moreover, the legality of VIE structures under the PRC law is still an untouched issue. In principle, the applicable laws prohibit any such circumvention and could declare such arrangements void and unenforceable. Considering the prevalence of the VIE structure on markets, it is unlikely the courts and administration would disassemble VIEs directly, but it remains an open question how they would assess such a mechanism. The Chinese

Association], <https://www.sec.gov/Archives/edgar/data/1577552/000119312514333674/d709111dex32.htm>.

competition authority, out of the same reason, has not reviewed a single concentration where VIEs are involved so as to avoid endorsing the validity and legality of the structure.

1.6.5.2. Alibaba Partnership

In addition to the VIE structure employed, Alibaba also adopted another special corporate governance mechanism – the Alibaba Partnership. Currently comprised of 36 senior management leaders who oversee the various aspects of the whole Alibaba ecosystem, the Alibaba Partnership (the “**Partnership**”) is at the heart of company’s governance. Alibaba’s Articles of Association explicitly grant the Partnership the exclusive right of nominating a simple majority of the company’s board directors, regardless the actual shareholdings of the partnership.⁴²⁶⁸ Such a unique corporate governance structure deviates from the general corporate principle of “one share, one vote” and confers the Partnership (which is in turn essentially controlled by the founders) the disproportionate control over the company.

The Partnership abovementioned to certain extent serves as the same function as dual-class shares by which the founders are empowered to elect the majority of the board votes while only holding a small portion of the company’s economic interests. Pyramids, cross-holdings and voting arrangements can more or less provides functions alike.

The Alibaba Partnership origins since the founding of the company in 1999, where 18 founders contributed to the initial funding of the company. In 2000, Alibaba formalized the Partnership as a Cayman Islands exempted limited partnership. In its U.S. IPO prospectus, Alibaba for the first time disclosed the function of the Partnership, which is composed by the company’s founders, managers, and managers from other companies in the Alibaba ecosystem (Ant Financial and Smart Logistics).

Besides, Alibaba has an even higher organ in its corporate governance structure, the Partnership Committee. The Partnership Committee is composed by five members and have the ultimate control over the nomination of the partners comprising the Partnership, and in turn the nomination of the directors of the Alibaba company.⁴²⁶⁹ According to the prospectus, the Partnership Committee has the right to nominate director candidates to be voted by all partners. The candidates endorsed by a simple majority of the partners are selected as the formal nominee of directors, which will then subject to a vote by shareholders. The Partnership Committee even reserves the right to nominate members for itself. The Partnership Committee serves a term of five years and may serve multiple terms. The elections are held every three years where 8 candidates proposed by the Partnership Committee and each partner votes for five nominees. Moreover, the Partnership Committee also controls the remuneration and bonus of all partners.

Alongside the supremacy conferred by the Partnership and the Partnership Committee, Alibaba further adopted very handy anti-takeover measures to protect and reinforce

4268 See Alibaba Grp. Holding Ltd., Amended and Restated Articles of Association 20 (2013) [hereinafter Alibaba Articles of Association], <https://www.sec.gov/Archives/edgar/data/1577552/000119312514333674/d709111dex32.htm>.

4269 Corporate Governance: Alibaba Partnership, ALIBABA GRP., http://www.alibabagroup.com/en/ir/governance_9

the absolute control. According to the Articles of Alibaba (Clause 1), any change of the Partnership's nomination rights would require the approval of 95% of all shareholders presenting the shareholders' meeting.

To summarise, the Partnership and Partnership Committee centralise corporate governance rights of Alibaba in a very limited number of members, which is concerned by shareholders for less of checks and balances

1.6.5.3. Taobao's private platform governance approach.

Collaborative governance is exceptionally important in China, as one would argue, the private governance provided by platforms are essentially providing substituting effects where the legal infrastructure provided by the state is not advanced or readily available. In that sense, Taobao is not only a simple matchmaker or an information exchange or a transaction facilitator, it also provides, to certain extent, legal infrastructure upon which a market is made possible.

Taobao's private rules cover several inter-related aspects, which are major problems intrinsically facing any transaction, which are, access to market, contract performance, fraud prevention and dispute resolution. Such aspects are intertwined with each other and formed an ecosystem of rules.

(i) Market access

In terms of *ex ante* market access regulation, the Chinese government has been for a long period creating a de-regulated environment for undertakings engaging in business operations. Save for a few industries where license and *ex ante* approvals are required, most online business operators and vendors are not required to obtain any license at all. Until the very recent, the newly promulgated Chinese e-commerce law started to require any business online to obtain required licenses as if it operates offline. In this regard, the practice relies heavily on the platform's self-regulation in terms of market access. On the contrary, Taobao has in place rules governing the verification of the identity, address, contact information, financial security of any vendor applicants. Vendors are required to follow Taobao rules when publishing product information and advertisements. All products and services of a merchant shall undergo a compliance review by the platform before getting listed online. By accepting the Taobao rules, the merchant on Taobao platform is abided by a series of contractual regulation imposed by Taobao. Failure to observe the Taobao rules would render the merchant for monetary punishment or even being banished from the platform.

(ii) Contract performance

Taobao has designed several mechanisms to address the information asymmetry between shoppers and vendors. Firstly, it provides an online feedback and rating system, by which the vendors are incentivized to strike for and maintain good reputation. However, Taobao's system took steps forward than Amazon and eBay in providing the rating system by establishing a massive escrow system through Alipay to assure both sides of

a transaction. The payment made by a shopper is not directly settled into the vendor's account. Rather, it is kept in the escrow account until all parties have performed their obligations. The escrow mechanism significantly enhanced Taobao's ability to enforce contracts.

(iii) Fraud prevention

Taobao has been long criticized for infringement of IPR and urged for much stringent measures taken. Further efforts have been seen made since 2012 as a response to such a public outcry. After an infringement is detected, Taobao can punish the fraudulent activities by both online and offline means. The online resorts include degrading the vendor's credit rating, de-listing the vendor from the search turnout for a certain period of time, and in extreme cases, closing the vendor's accounts.

Besides, efforts are also made in preventing identity theft and payment theft. It is worth noting that big data is creatively used in this regard as an identity theft is detected by comparing the user's behavioral data which includes usual payment method, delivery details. Obvious fraud is immediately processed by the platform by suspending the transaction involved. Where the case is suspicious but not clear enough, further verification is required to be made by the user himself. In recent years, biometric authentications such as the touch ID and the Face ID are also adopted by Taobao as a important resort of identity and payment verification.

(iv) Dispute resolution

Taobao also provides an alternative dispute resolution where disputes occur between its market participants. As one can imagine, most of the disputes dealt by Taobao are either buyer-vendor disputes over a contract breach or vendor-platform disputes where the vendor claims to be unfairly punished by the platform for breach of the platform rules.

To address the needs, Taobao designed a "jury-ish" system where 13 jurors (so called "public assessors") are randomly selected out of a pool of over three million of volunteers, whose credit rating has to meet a pre-decided threshold. The evidence submitted by the disputing parties is then reviewed and assessed by the selected assessors for an anonymous vote. Interestingly, there is no direct communication between the disputing parties and the assessors. One assessor is also unaware of the identity of the others. All communication is conducted in writing and each assessor is required to provide written comments over the dispute. The decision by the assessors is not final, as the disputing party can nevertheless request for Taobao employees to re-examine the case.

The decision made through the platform's mechanism can of course be challenged before a state court. However, the decision is still in many aspects enforceable as the platform can act upon such decisions to freeze the account of a vendor or a user, or degrade his credit rating, or (for vendor only) increase its required amount of security deposit. As we noted, freezing the payment in escrow further forces parties to engage in and comply with the platform's dispute resolution system. The state courts also usually defer to

this quasi-judicial mechanism, as it from a practical perspective provides an effective and efficient way of resolving the mounting disputes.

3.7.6.5.4. The collaborative platform governance between Taobao and the government

Having said above the benefits of Alibaba's ecosystem and Taobao's private governance structure, it goes beyond saying that such benefits could be double-sided. While enabling the platform to operate effectively, there is a risk that the platform exploits such economic power over the users to benefit the platform itself. Such a risk is increasingly noted by competition academics and law enforcers. It is as important to utilize the benefit of private governance as to put it under checks by state and judicial system.

The Chinese adopted a regulation approach. It acknowledges the efficiency of platform private governance, but also concerns about the platform's potential conflict of interest both as a rule maker and a stakeholder. In response to the platform's asymmetrical power over the operator on platforms and consumers, there are three clauses in the Chinese e-commerce Law in place addressing the platform's power as a "quasi-regulator". These clauses cannot necessarily be categorized as in competition law toolkit but still regulate the platform's power of rulemaking in many ways.

- Article 32 E-commerce platform business operators shall, on the basis of the principles of openness, fairness and justice, formulate platform service agreements and trading rules clearly stating their rights and obligations in entry into and withdrawal from the platform, quality assurance for commodities and services, consumer rights protection, personal information protection, and in other aspects.
- Article 33 E-commerce platform business operators shall continuously display their platform service agreements, trading rules, or links to such information in a conspicuous position on their homepages, and ensure that business operators and consumers can conveniently read and download the information intact.
- Article 34 In the event of revising platform service agreements and trading rules, e-commerce platform business operators shall solicit public comments in a conspicuous position on their homepages, and take reasonable measures to ensure that relevant parties can promptly and adequately express their opinions. The revised content shall be publicised at least seven days before it is implemented.
- Where on-platform businesses do not accept the revised content and request to withdraw from the platform, e-commerce platform business operators must not obstruct them and shall take on relevant responsibilities in accordance with the previous service agreements and trading rules.
- Article 35 E-commerce platform business operators must not use platform

service agreements, trading rules, technologies or other methods to impose unreasonable restrictions or requirements on on-platform businesses' transactions, trading prices, or transactions with other businesses, or collect unreasonable fees from on-platform businesses.

Considering the above, we propose below a summary table which illustrates the responsibility allocation between the Taobao platform and the government:

Stage	Regulatory content		Government	Platform
Ex ante	Market access	Vendors	General market access registration; Special approval if regulated business involved.	Review the information submitted by the user, verify the true identity, qualifications of the vendor, etc.
		consumer	N/A	N/A
	Product/service release		N/ A	Review before release, Suspend the release if obvious violations
In process	IP Infringement, fraud, false transaction		Administrative inspections	Detecting irregularities through big data, manually inspection once infringement is reported.
Ex post	Penalty over user / vendor		Administrative penalties Order the platform to elect measures such as shutting down the account.	Penalties according to the platform rules, including degrading the credit rating, closing the account, delisting the products, etc.,
	Claim of damages		Judicial procedures upon user's claim	Platform dispute resolution and security deposit system

Annex 2: Sources of sustainable competitive advantage in the digital economy

Ioannis Lianos and Andrew McLean

This Annex follows up Section 4.3.4. of the Report (Chapter 4) and provides an overview of the sources of sustainable competitive advantage in the digital economy. We consider that this mapping may provide competition authorities insightful information as to the different parameters they need to take into account in their competition assessment, in particular regarding the role of digital (technology but also transaction or hybrid) platforms. As is explained by Economides and Katsamakas, '(t)echnology platforms are the hubs of the value chains in technology industries'.⁴²⁷⁰ This position is explained by the various forms of sustainable competitive advantage from which benefit these platforms in both their horizontal and vertical competitive interactions. Some of these competitive dimensions are similar to those in conventional markets, while others are distinctive to platform businesses⁴²⁷¹. This competitive advantage derives from technology and the control of important technological bottlenecks, strategies of integration and expansion and financial sources. We explore each of these dimensions of sustainable competitive advantage as this may shed light on the appropriate policy tool in order to promote contestability.

4.3.4.1. Technological sources of competitive advantage

At the early years of technological transformation, when new players emerge, the industry is likely to be marked "by relatively high price-cost margins, at least for the more competent firms"⁴²⁷². This may lead some of the actors that have acquired superior resources and developed superior capabilities to benefit from 'abnormal profits'. These erode as the industry matures; there is new entry and industry capacity is aligned with industry demand⁴²⁷³. However, the industry is usually still marked by firm heterogeneity. Some firms continue to benefit from high rates of return and sustainable 'abnormal' profitability, 'in spite of competition'⁴²⁷⁴, while others see their profits erode when the market, following the initial hype generated by the newness of the technology, returns to equilibrium⁴²⁷⁵.

⁴²⁷⁰ N. Economides & E. Katsamakas, Two-Sided Competition of Proprietary vs. Open Source Technology Platforms and the Implications for the Software Industry, (2006) 52(7) Management Science 1057, 1057.

⁴²⁷³ Ibid.

⁴²⁷⁴ Ibid, 1388.

⁴²⁷⁵ Ibid, 1385.

This heterogeneity as to the profitability of firms present in the industry may be due to the business acumen of firm's leaders, the creativity and persistent effort of the firms' human resources, a timely purchase of key resources that establish entry barriers to potential competitors, or even happenstance. Some authors argue that it may also be explained by investments made in the possession of 'idiosyncratic rent-earning resources' or by developing capabilities that cannot be imitated by competitors⁴²⁷⁶. These resources and capabilities are acquired through a process of customization that ties them with the specific firm. One could therefore distinguish between generic resources and capabilities, which may be easily acquired through the market, and customized or specialized resources and capabilities that can only be developed within the firm, often following a long period of investment and institutional learning⁴²⁷⁷. The acquisition of these 'idiosyncratic' resources and capabilities, often after a lengthy process of customization so that they become part of the firm's 'productive fabric', constitutes one of the possible routes for achieving a sustainable competitive advantage⁴²⁷⁸. These resources and capabilities may be leveraged by a number of strategies put in place by the firms in order to ensure they can maintain their scale advantage, such as denying efficient scale to their competitors or raising barriers to entry, for instance through the use of exclusionary practices and aggressive IP rights strategies.

Acquiring a first mover advantage is certainly a successful strategy but for it to be maintained and eventually expanded on the firm should make considerable investments on innovation. It also makes sense for the firm to focus on difficult problems that no one else has previously explored, seeking technical solutions that could potentially be implemented in the whole industry. Economic actors wishing to succeed in gaining sustainable competitive advantage aim therefore to adopt conduct in complementary spheres or markets that will be strategically linked with the core assets they control with the objectives of protecting the advantage provided by these capabilities and of limiting the possibility of their rivals to copy them. Thus, in order to protect their profits, economic actors will have to develop isolating mechanisms of their competitive advantage.

A possible mechanism to protect the competitive advantage in the long-term is technical complexity. By developing complex technical standards on which competitors' activity rely upon, by combining access to large amounts of data, or access to unique data, being able to use cryptographic techniques, unique computational power, cheap and extensive storage capabilities and powerful algorithms and AI capabilities, firms can make it more difficult for their competitors to reproduce the firm's original competitive advantage. Attracting highly specialised staff who have been specifically trained in this complex combination of assets, may also have significant effects on competition.

These practices may be combined with a strategy of patenting core technologies, developing an IP portfolio protecting investments in these technologies, and/or proceeding with a simple protection as a trade secret.

4276 Ibid, 1404.

4277 Ibid, 1386.

4278 Ibid, 1406.

The initial conditions under which the Internet developed were characterised by its distributed technological structure, which relied on an interconnected system of thousands of individual networks enabling people to connect directly with each other through desktop computers⁴²⁷⁹. In this system, people were able to create and use new peer-to-peer services without needing to seek permission from any third party⁴²⁸⁰. The Internet dream was depicted as ‘decentralised’, ‘democratic’, and profoundly inspired by the ‘hacker ethic’ of freedom⁴²⁸¹. This anarchic or libertarian, depending on whom you ask, vision of the Internet welcomed the lack of a centre and underpinned a preference for this being a space of atomistic competition where no private or public actor would be able to own or control the medium and its content.

In reality, its technological foundations favoured a distributed, and not decentralised as such, structure of control⁴²⁸². Despite the emphasis put on decentralisation, a few tens of networks providing international connectivity spanning countries and continents occupy central positions in the global internet topology; these constituting, from a technical perspective, distributed points of control⁴²⁸³. However, even if technology was not exactly decentralised, the ethos of this first-generation Internet was profoundly marked by the decentralisation narrative. Benkler, one of the leading legal commentators on Internet-related issues, notes how the basic end-to-end design principle characterising the web and the generality of the protocol made it quite difficult to identify the nature of parties to a communication; it offered “no control points through which an entity could exclude or constrain another discrete entity attempting to use it”⁴²⁸⁴.

This portrayal of the Internet, however, soon became antiquated, as the shift to proprietary, controlled devices, software and networks in the early 2000s led to the emergence of a number of intermediaries and additional points of control, in both technical and economic senses. This led to the accumulation of power by a limited set of influential players that re-shaped Internet’s architecture thereby countering the initial decentralisation dynamic. Of course, this re-shaping was not the inevitable consequence of

4279 Note, however, that ARPANET, the first network to implement the protocol suite TCP/IP, which became the technical foundation of the Internet was administered by a single organisation through centralised control.

4280 Yochai Benkler, “Degrees of Freedom, Dimensions of Power”, (2016) 145(1) *Daedalus*, 19 writes that during this first period “the Internet was not only a technical system but also an innovative organizational system; an institutional system pervaded by commons; a competitive market with low barriers to entry; and, finally, a zeitgeist, cultural habit of mind, or ideology, perhaps best captured by the saying from computer scientist and early architect of the Internet, David Clark: ‘We reject: kings, presidents and voting. We believe in: rough consensus and running code’.”

4281 Jennifer Grannick, “The End of the Internet Dream?”, (Wired.com, 17 August 2015), <<https://www.wired.com/2015/08/the-end-of-the-internet-dream/>>.

4282 A. Mathew, “The Myth of the Decentralised Internet”, (2016) 5(3) *Internet Policy Review*, noting that the Border Gateway Protocol (‘BGP’), the technology that enables the interconnection of separate networks to form the global internet relies on three elements: (i) the packet switched networks that break up communications into individual packets of data, (ii) the routing protocols: each of these packets traverses multiple independently administered networks, each of them taking different paths to their eventual destination, at which point they are reassembled, the route being determined by a number of routing protocols which are variations of the BGP, which forms the common routing protocol, and (iii) the topology of these interconnected networks, which is a complex graph ‘consisting of over 55,000 individual networks’.

4283 Ibid.

4284 Y. Benkler, “Degrees of Freedom, Dimensions of Power”, (2016) 145(1) *Daedalus*, 19, 20.

the techno-social structures of the Internet, which as mentioned were biased towards decentralisation, but was entirely due to the strategies (and, thus, the agency) of a few players that soon came to control the vast amounts of information generated by Internet use⁴²⁸⁵.

These different strategies hint to the emergence of bottlenecks or chokepoints in the digital economy. The concept of bottleneck has been used to describe 'a scarce resource that is key for controlling performance and competitive position within an industry' or as 'the critical asset or position that enables a firm to exercise control over the platform ecosystem'⁴²⁸⁶. The control of a bottleneck may confer 'bottleneck power'. The last term has been defined quite broadly as 'a situation where consumers primarily single-home and rely upon a single service provider (a "bottleneck"), which makes obtaining access to those consumers for the relevant activity by other service providers prohibitively costly'⁴²⁸⁷, or in order to refer to 'markets (that are frequently important routes to market, or gateways for other firms', thus providing these firms the ability to 'act as a gatekeeper between businesses and their prospective customers'⁴²⁸⁸. Hence, bottleneck power may not necessarily result from the control of what can be defined as a bottleneck in the sense of the narrow definition provided above, but may also rely on other sources that provide the specific firm the ability to have a gatekeeping role. We will explore other possible sources of 'bottleneck power' in a subsequent Section (taking a more dynamic perspective). In this Section we proceed with the definition of possible bottlenecks that may be controlled by one firm and could become a source of 'bottleneck power' by looking to the assets, resources and capabilities in the digital economy that may be considered as 'scarce' or 'critical' in order to exercise control over the industry or a broader platform ecosystem. One needs nevertheless to have here in mind that the static approach taken in this Section, as we focus on what can be considered, in abstract structural analysis, as a 'scarce' or 'critical' asset or resource in the digital economy, does not dismiss the need to consider agency, and in particular the business strategy of the firm(s) in the industry. Indeed, there is a fine line sometimes distinguishing a 'bottleneck' from a 'commodity', when access to the specific asset or resource stops being indispensable, or becomes shared by multiple firms, and this ceases to be a 'competitive differentiator'⁴²⁸⁹. This transformation of a bottleneck to a commodity has been a constant feature in the IT in-

4285 This process and strategies are well described in Tim Wu, *The Master Switch: The Rise and Fall of Information Empires* (First Vintage Book, 2011).

dustry and shows how bottlenecks are not just the consequence of structural positioning but predominately result from strategies.

A summary analysis of the evolution of bottlenecks in the IT industry shows that we have moved from a situation in which bottlenecks were predominately situated in the physical infrastructure, which was regulated, to bottlenecks that are situated in the access to data, through the control of virtual infrastructure, nervous and algorithms, which are still mostly unregulated. The term 'data' is broadly defined as covering a variety of data/information that could be commercially valuable. We briefly provide a typology before examining the occurrence of bottlenecks in the current system of the digital economy.

4.3.4.1.1. The data bottleneck

4.3.4.1.1.1. Typology of data

Data is important asset and resource because it enables its users to predict phenomena, simple or complex, human or natural.

Almost 4 billion people own mobile telephones. Re-manufactured mobile phones cost about U.S. \$10 in the developing world, and receiving messages usually costs nothing. Data constitutes an essential input for various online services, production processes, logistics, smart products, and artificial intelligence.⁴²⁹⁰

This typology will discuss various categories of data focusing on the general category of "big data". When people speak of big data, they are referring to evaluating different varieties of data: location data, purchasing data, telephone call patterns, email patterns, and social graphs on social networks.⁴²⁹¹ In addition to data derived from internet-enabled devices, big data includes machine data, video and voice recordings, and various other types of structured and unstructured data.⁴²⁹²

The raw input of big data is metadata.⁴²⁹³ Smartphone apps generate a tremendous amount of metadata. App developers generally take the following steps. They develop a smartphone app to collect metadata. The app sends the data to a server run by the developer, which then must store the data. Developers often seek to anonymize the metadata. An algorithm retrieves the metadata to answer a specific question, for example, which song or type of music to play.⁴²⁹⁴

Analytics reflected in the algorithm consist of discovering noteworthy patterns in data. It involves utilizing explanatory and predictive models to drive fact-based decisions.⁴²⁹⁵

⁴²⁹⁵ EY, Big data: Changing the way businesses compete and operate, (Apr. 2014), 6.

To understand the process, the following terminology helps. From the perspective of a typology emphasising the *creation of data*, data generally falls into three categories: (1) volunteered data, (2) observed data, and (3) inferred data. When individuals volunteer data, they give a name, an email address, an image or video, or a post on social media. This data is structured because an individual generated it.

Data also can be observed. A great deal of activities now leaves a digital trace: observed data involves automatically collecting behavioural data from a user's or a machine's activity. Basic types of this data include the movement that a mobile phone tracks or clicks on a web page.

Inferred data requires transforming, in a non-trivial manner, volunteered or observed data. Businesses make money from this type of information, because it permits them to predict a person's propensity to purchase or other preferences. A shopper or music fan's profile qualifies. Neither privacy nor competition law usually creates a duty to share inferred data.

Requests for information therefore focus on observed data, when rivals cannot replicate it, or volunteered data that would require prohibitive efforts to re-acquire consent.⁴²⁹⁶

In addition to the categories relating to how data is created, the *form* of data also matters. It can consist of (1) individual-level data, (2) bundled individual-level data, and (3) historical or real-time data. Entities usually request data to offer a complementary product or to train algorithms for related or unrelated markets.⁴²⁹⁷

Privacy protection can hinge on *how data can be used*. Data may relate to (1) personal information, that is (a) non-anonymous individual-level data, or (b) anonymous individual level data (often for machine learning), (c) aggregated data (sales data, national statistics), and (d) contextual data (satellite, mapping data).

Non-anonymous use of personal information (individual-level data) may qualify as the most valuable asset, in particular because of the regulatory barriers imposed on its harvesting by the development of regimes of privacy protection in some jurisdictions (e.g. the General Data Protection Regulation –GDPR in the EU). The information may permit switching, or it may increase the quality of a service enough to provide a considerable competitive advantage to the firm using this data. Complementary products often rely on this data. This information may include both historical and ongoing observed data on an individual or a reasonably identifiable individual, even indirectly identified in combination with other information.⁴²⁹⁸ This information may be as simple as a name or a number or could include other identifiers such as an IP address or a cookie identifier, or other factors⁴²⁹⁹. The GDPR provides a non-exhaustive list of identifiers, including name, identification number, location data and online identifiers⁴³⁰⁰. According to the GDPR,

4296 EU Commission Report, at 8, 24-25, 101.

4297 Ibid., p. 8.

4298 Ibid., pp. 25, 31.

4299 See Art. 4(1) GDPR.

4300 See, Recital 30 GDRP.

‘processing of personal data revealing racial or ethnic origin, political opinions, religious or philosophical beliefs, or trade union membership, and the processing of genetic data, biometric data for the purpose of uniquely identifying a natural person, data concerning health or data concerning a natural person’s sex life or sexual orientation shall be prohibited’ subject to a limited number of exceptions, such as the data subject has given explicit consent to the processing of those personal data for one or more specified purposes, the processing is necessary to protect the vital interests of the data subject, the processing is necessary for reasons of public interest in the area of public health etc⁴³⁰¹. The processing should be lawful in these circumstances⁴³⁰².

This data should relate to the individual. According to the GDPR, the harvesting of personal data may also include information which has had identifiers removed or replaced in order to pseudonymise the data⁴³⁰³, or data that is encrypted. Article 20 of the GDPR establishing the principle of data portability for personal data does not recognize a right to continuous data access. Instead, it permits the transfer of accumulated past data.⁴³⁰⁴

If personal data is anonymised then this is not subject to the GDPR rules⁴³⁰⁵. Similarly, information concerning a ‘legal’ rather than a ‘natural’ person is not personal data and therefore also not subject to GDPR.

Information that is not personal data consists non-personal data, therefore falling outside the scope of the prohibition of Article 4 GDPR which only applies to personal data. Hence, there is a principle of free flow of this data, which derives from various sources (corporate, state etc.). Non-personal machine-generated data and sensor data may be particularly valuable as well, in particular in the context of smart manufacturing and connected systems (e.g. connected cars). Article 20 of the GDPR does not grant a mandatory right for individuals to port non-personal data⁴³⁰⁶. This data may be protected by other means, such as trade secrets, traditional intellectual property rights (e.g. copyright, patents, etc.), or through other legal instruments (e.g. tort law, law of unfair competition).

Not all data is big data. Fast data exists, and it enables an organization to determine personal preferences quickly. For instance, fast data may evaluate demand response and reduce power consumption. Dark data essentially refers to unstructured data, which organizations cannot easily access. It can provide rich information: video streams, photographs, and handwritten answers to questionnaires. Lost data, or operational data, de-

4301 Art. 9 GDPR.

4302 See Art. 6 GDPR.

4303 According to Art. 4(5) GDPR, ‘pseudonymisation means the processing of personal data in such a manner that the personal data can no longer be attributed to a specific data subject without the use of additional information, provided that such additional information is kept separately and is subject to technical and organisational measures to ensure that the personal data are not attributed to an identified or identifiable natural person’.

4304 EU Commission Report, p. 81.

4305 According to recital 26 GDPR, ‘...(t)he principles of data protection should therefore not apply to anonymous information, namely information which does not relate to an identified or identifiable natural person or to personal data rendered anonymous in such a manner that the data subject is not or no longer identifiable. This Regulation does not therefore concern the processing of such anonymous information, including for statistical or research purposes’.

4306 EU Commission Report, pp. 8, 88.

rives from manufacturing equipment or industrial machinery. Experts say ‘lost’ because the owner cannot easily remove it from operational systems. New data involves data that a business could acquire or use, but for whatever reason, it is not harvesting it.⁴³⁰⁷

Moving beyond classifying, the rest of this typology will focus on a few meaningful uses of data. Evaluating basic information from standard carriers’ logs—phone calls and text messages sent and received—researchers have been able to predict more accurately the personality of a mobile phone user. Mobile phone datasets provide an “unobtrusive and cost-effective” alternative to measuring personality traits relative to surveys. To take an example, the time lapse between when a person receives and answers a call can indicate conscientiousness. The other categories were extraversion, agreeableness, open to experience, and emotionally stable. The study revealed information and verified hypotheses with a degree of accuracy from between 29 percent and 56 percent better than random.⁴³⁰⁸

Crunching data related to voice, communications, and mobility patterns can yield the power to screen for depression and to surmise other quality-of-life factors.⁴³⁰⁹ Comparing medical data including exercise, diet, and medicine consumption with genomic data from various population samples permits understanding how health can depend on the interaction between genes and environment.⁴³¹⁰ The data collected by mobile phones could enable interested parties to measure behaviour directly.

Government-compiled statistics can also be an additional source of data. This can be open, to the extent that governments have adopted policies favouring the disclosure of information (non-personal data or aggregated anonymised personal data) in order to promote transparency, accountability and value creation (open government data policies)⁴³¹¹.

4.3.4.1.1.2. Bottleneck resulting from the legal protection of data: the role of legal institutions

There are various protection regimes that may impede, or facilitate, access to data, and national approaches are different on this issue. In principle, data is a public good to the extent that consumption of data (information) by one individual does not reduce the amount of data (information) available for other individuals to use. If access to data may be limited, this mainly results from the legal institutions, or the absence of legal institutions, regulating its use. In the absence of a proper legal regime providing some form of protection to data, through property rights, through liability rules or through

4309 Global Information Technology Report 2008-2009, *supra* n.1 at p. 77.

4310 *Ibid.*, p. 79.

4311 For a discussion, see Open Government Data Report Enhancing Policy Maturity for Sustainable Impact DOI:<https://doi.org/10.1787/9789264305847-en>. In the EU, see Directive (EU) 2019/1024 of the European Parliament and of the Council of 20 June 2019 on open data and the re-use of public sector information, [2019] OJ L 172/56, replacing the previous Public Sector Information (PSI) Directive.

inalienability rules⁴³¹², data are subject to the possession of the entity that harvested them. This may provide this entity a *de facto* control over the data and the possibility to exclude others to use it, to the extent that they do not dispose the technology or control over the access points to the data so as to be able to harvest it by themselves.

The absence of a legal regime providing property rights on data may thus lead to situations of *de facto* control over significant amounts of data, in particular sensitive personal data over the lifestyle of an individual, or its digital and genomic identity.

However, even if the issue of creating property rights on data, providing the possibility to their property right holders to use injunctions and exclude others from their use, and to whom these property rights should be granted, is a controversial issue in most legal regimes, there are various legal institutions that have been put in place, establishing a highly fragmented property rights or property rights-like regime or organising access to this data.

For instance, while pure data is not protected by copyright in the US⁴³¹³, but can only be protected through other means⁴³¹⁴, datasets may be protected by copyright and a *sui generis* right in the EU. The protection of the intellectual creativity embodied in databases is provided through copyright (under Article 3 of the EU Database Directive). The EU Database Directive also protects investment in the collection, verification and presentation of the contents of database are protected via a *sui generis* right, which allows the database maker to prevent any extraction and/or re-utilisation of substantial parts of those contents for 15 years (Article 7 of the EU Database Directive). In *Ryanair v PR Aviation*, the CJEU held that database makers whose database falls within the definition of a database but do not fulfil the conditions of copyright or the *sui generis* right, can rely on contract to override any exceptions to the Directive⁴³¹⁵.

As explained in the previous Section, the non-anonymous use of personal information (individual-level data) may be protected by specific horizontal data protection or privacy laws, such as Article 8 and the GDPR in the EU⁴³¹⁶, or the recently adopted California Consumer Privacy Act 2018⁴³¹⁷. There also exist a number of sector specific data and privacy protection regimes, such as in the US with hundreds of provisions enacted at both federal and state levels.

Having a legal regime granting property rights on data or protecting data and therefore limiting their use, is not however the only option. It is possible that a legal regime mandates access to the data or organises the pooling of data. There has been a dissemina-

4317 See, <https://www.caprivacy.org/>.

tion of specific access regimes for certain types of data.

For instance, Directive 2003/98/EC on Re-use of Public Sector Information provides that public authorities should provide access to certain public sector information. Public sector bodies may charge fees for supplying and allowing access to the information, but they need to be reasonable, given the circumstances of public sector actors. In particular, “the total income shall not exceed the cost of collection, production, reproduction and dissemination, together with a reasonable return on investment”.⁴³¹⁸ The Directive requires, that applicable conditions and charges should be transparent (i.e. pre-established and public), including (on request) the calculation basis for fee and what factors should be taken into account in the calculation of charges for atypical cases).⁴³¹⁹ These principles are taken forward by the recently adopted Open Data Directive⁴³²⁰.

The revised Directive on Payment Services in the Internal Market⁴³²¹ of 25 November 2015 sets out that account servicing payment service providers, such as banks, must allow third parties to obtain real-time data relating to customers’ accounts on a non-discriminatory basis (including without any discrimination in terms of charges, timing and priority).⁴³²²

In 2018, the Commission published a Guidance on Sharing Private Sector Data in the European Data Economy where it provided certain principles of voluntary data sharing between businesses (B2B) and between businesses and government (B2G).⁴³²³ In particular it recommended that following key principles be respected in contractual agreements: i) transparency (persons or entities entitled to have access to data should be clearly identified, as well as the type of data and the purpose of using the data); ii) shared value creation (contracts should recognize that often several parties contribute to creating data); iii) respect for each other’s commercial interests (commercial interests and secrets of both data holders and data users should be respected); iv) ensure undistorted competition when exchanging commercially sensitive data; v) minimise data lock-in (data portability should be enabled as much as possible).

4.3.4.1.2. Bottlenecks in physical (and virtual) infrastructure: the role of ISPs, smart device providers and cloud computing

The development of the Internet and therefore that of the digital economy relies on a physical infrastructure that forms the core of the system and on which different applica-

tions, some with commercial use, are built upon (see Figure A2.1.).

Figure A.2.1. Internet layers⁴³²⁴

Source: authors’ compilation

The physical layer encodes and transmits bits and comprises all pieces of hardware necessary for machines to transfer and receive information from the Internet (e.g. cable modems, satellite bits). The link and network layers comprise protocols supporting the interface with the hardware connected to the Internet. The application layer protocols break down data into smaller packets and these are then transferred (via the transport layer) to the network layer to reach their destination. The transport layer ensures that data packets sent through the network layer are properly delivered. The network layer enables computers connected to the Internet to be assigned unique IP addresses thus assisting packets of data navigate across the network through a variety of computers until they reach the requested destination.

Bottlenecks in the physical infrastructure of the Internet have not emerged because of the rapid technological evolution, in particular the presence of competing hardwired broadband access though the evolution from analogue Internet access on the basis of PSTN (Public Switched Telephone Network) to digital access through the high frequencies of the Digital Subscriber Line (DSL), cable network or broadband over power lines (BPL), and the development of wireless (e.g. satellite and mobile broadband) and hybrid broadband access. This vivid technological competition at the physical infrastructure level reduced the need for regulation to deal with the strong network effects in the physical networks, with the exception of net neutrality rules⁴³²⁵.

4324 Inspired by a table in P. De Filippi & A. Wright, Blockchain and the Law (Harvard University Press, 2018).
4325 This approach, in particular in the US, was named ‘unregulation’J. Oxman, The FCC and the Unregulation of the Internet

Although the physical network of the Internet does not form a natural monopoly, it is interesting to think of the way natural monopoly in physical infrastructure in the telecommunications market was dealt during the initiation of the general purpose technology of telephony the first half of the 20th century, in particular with the establishment of mandatory interconnection following regulation in 1934-1935, as this may provide some insights on the way regulation may take place, should we consider there is a bottleneck at some level. Indeed, despite the presence of important network effects in the telecommunications industry⁴³²⁶, dominant telecom operators, such as AT&T, could not use them strategically because of mandatory interconnection rules.

AT&T originally had monopoly because of its patent. At the expiry of the patent, AT&T had covered only a small percentage of the US because large capital investment was needed and also because of its high pricing of telephone service. AT&T covered only 10% of the market, mainly businesses where the telephone was offered as an upgrade to telegraph service for ordering etc. Once the patent expired, new “independent” telephone companies entered and provided local telecommunications within towns, but they did not have a long distance technology and were rarely able to reach other towns. AT&T was the only telecommunications company with long distance technology protected by patents that had not expired. AT&T refused to interconnect its long distance network with the independents unless they were acquired by AT&T (become “part of the Bell System”). This created the situation where many businesses had two phones of different incompatible networks: one with AT&T through which they talked to their suppliers, and one with an independent company through which they talked to their customers. The refusal to interconnect strategy of AT&T served it well. In 1914, the independents had about 50% of all US access lines (lines to the home or business – last mile), while AT&T had 100% of these around 1900. By 1934, AT&T had expanded its market share to 89% mainly through acquisition of independents. After the 1934 regulation and mandatory interconnection (and the creation of the Federal Communications Commission, FCC) was put in place, AT&T’s market share remained about the same until its breakup in 1981.

Under the old 1934 regulation, the regulated company’s profit should be less than capital investment x rate of return (which was fixed by regulators, e.g. 6-10%). AT&T had a lot of price flexibility on individual product and services pricing since it was the total profit of AT&T that was capped.⁴³²⁷ Revenue caps for each line of business started after 1970.

(FCC, OPP Working Paper No. 31, July 1999), available at <https://www.fcc.gov/reports-research/working-papers/fcc-and-unregulation-internet>.

4326 These were already identified an important source of sustainable competitive advantage by Theodore Vail, the chairman of the AT&T in 1908, who noted in his annual report to the shareholders the value that AT&T derived from its network of subscribers, rather than the quality of its technology: see, Annual Report of the Directors of AT&T to the Stockholders, (1908) 20-21, available at https://beatriceco.com/bti/porticus/bell/pdf/1908ATTar_Complete.pdf?source=post_page-----.

4327 Because the formula allowed higher profits if there was higher investment, AT&T had an incentive to do more capital investment everything else being equal. Therefore, there was overinvestment.

Returning after this historical detour to the current situation with regard to the Internet, Internet Service Providers (ISPs), although most are telecom companies, do not have formally a mandatory interconnection regulatory requirement. However, since the beginning of the Internet there were no cases of refusal to Interconnect. In thinking about ISPs, we note that there are four types. First, residential customers' ISPs such as AT&T. Second business customers' ISPs (not shown in the diagram). Third, Internet backbone ISPs, commonly called Internet Backbone Providers (IBPs). Fourth, ISPs of content and applications providers such as Google and Netflix.

The long-distance part of the Internet (Internet backbone) is effectively competitive because it is based on fiber optic network connecting different cities where the various companies that own parts of the backbone interconnect usually at the same points in each city. So, the product/service is almost homogeneous. The cost of securing rights of way and digging to create the fiber optic network of the backbone is substantial. So once the companies dug they put a very substantial amount of fiber, much more than was needed at the time.

Additionally, technological advances enabled the better use of fiber optic (same fiber is now used for more frequencies and that allow the same fiber to have much bigger capacity). As a result, there is a lot of excess capacity ready to work (lit fiber) on the backbone. Additionally, there are large amounts of fiber not ready to use, but requiring just the addition of electronics at its edges (called "dark fiber"). Dark fiber also adds to potential excess capacity and suppresses the amounts of money that backbone companies can make.

The main service that Internet backbone providers (IBPs) sell to ISPs is called "transit." The service is essentially access to the whole Internet through a pipe of a certain width, and prices are roughly proportional to the width of the pipe. In every transmission from ISP1 to ISP2 connected to the same IBP, the IBP collects money from both ISPs. However, for reasons explained above, the IBP market is effectively competitive.⁴³²⁸

There is no up to date information on market shares of the backbone but the market, in Europe, the US and BRICS, is characterised by a tight oligopoly in the ISP market for residential customers [in the US this market is controlled by AT&T, Verizon, Comcast and Charter (Spectrum) which have the largest market shares]. This leads to an oligopoly market: the market for ISPs which are for residential users, which is concentrated with 4/5 players. One cannot however exclude the possibility of monopolistic ISPs, in particular in rural access markets where natural monopolies exist due to high deployment costs. There is also a market for ISPs for

4328 Pricing by Internet Backbone Providers (IBPs) to Internet Service Providers (ISPs) takes two forms, transit and peering. A "transit" contract, delivers the whole Internet through a virtual pipe of a pre-determined maximum bandwidth. "Peering" allows free exchange of information packets between two ISPs X and Y or two backbones. Peering is limited to traffic originating or terminating at X or Y and cannot be applied to traffic continuing to some further point Z. Two ISPs of comparable sizes use peering on their traffic to each other so they buy less traffic through "transit," and thereby cut their costs. Since peering is limited to traffic between two ISPs (X, Y), even peering ISP X need to buy transit for traffic that originates or terminates not at Y. So buying transit is necessary even in the presence of peering.

content providers (for Google, Netflix, Disney etc.) and ISPs for application providers (e.g. Microsoft) which is very competitive because of the countervailing buying power of content and application providers. Finally, there is a third ISP market for businesses which has more rivals.

The regulation of ISPs has implications on their capacity to harvest data, which is often perceived as the most important resource/asset in the digital economy. Because of the principle of network neutrality, which applies in the EU, Brazil and India, but not any more in the US, and not in China and Russia, although it has been under discussion in South Africa, there was no point for ISPs to collect data on the use of their services by the end users, to the extent that there were not able, because of net neutrality regulation, to discriminate between competing content and applications⁴³²⁹. Network neutrality rules can be strict, when 'each datagram should be treated in exactly in the same way to assure an Internet that is agnostic to content, speakers, and devices', or weak, when some level of differentiation or service quality and prices is possible, although this is subject to some non-discrimination tests⁴³³⁰. However, after the repeal of network neutrality rules in the US in June 2018⁴³³¹, the ISPs have a wide range of strategies available. The ISPs can detect what type of traffic the consumer uses and could also find out the location of wireless customers. This far, we have not seen any systematic attempt by the residential ISPs to use the information they can garner from these two sources.

ISP providers could collect data and they thought that because the abolition of network neutrality they could do that, but a year since the abolition of network neutrality none of the ISPs seems to have invested in data harvesting. They collect only data from data transmission which provides them information on what kind of service this is (video, email, voice etc) but it is not possible to know the content although it is possible to know from whom to whom (Ip address to what IP address) this content is transmitted, which may provide in itself hints as to the type of content this is. This is because they throttled (reduce bandwidth) for B-Torrent files. Just to make the network work better they need to twick it. If someone downloads video it is more efficient for them to send the other part of the video. The ISP market for businesses has more rivals.

Beyond the ISPs, it is possible for the providers of the devices that are used to connect with the Internet may be able to harvest data. Over 4.33 billion people were active internet users as of July 2019, encompassing 56 percent of the global population⁴³³². These

4329 For an early general discussion on network neutrality, see T. Wu, *Network Neutrality, Broadband Discrimination*, (2003) 2 *Journal of Telecommunications and High Technology Law*, 141.

4330 J.M. Bauer, *Effects of Network Neutrality Regulation and Competition Policy on the Evolution of the Internet* (July 2019), available at <http://quello.msu.edu/wp-content/uploads/2019/07/Bauer-Network-Neutrality-IAMCR-Madrid-2019-Final-Draft.pdf>.

4331 After the US Federal Communications Commission (FCC) had promulgated legally non-binding Open Internet Principles in 2004 and the Open Internet Order 2010, successfully challenged in courts (**Comcast Corp. v. FCC**, 600 F.3d 642 [DC Cir. 2010] and **Verizon v. FCC**, 740 F.3d 623 [DC Cir. 2014], the FCC passed the net neutrality rule of 2015 which treated the Internet as a telecommunications service subject to the common carrier rule, which was ultimately confirmed by the courts, network neutrality rules were repealed in June 2018.

4332 <https://www.statista.com/statistics/617136/digital-population-worldwide/>.

connect to the Internet through a number of devices (desktop PCs, laptops, tablet computers, smartphones, smart TVs, netbooks). These devices also enable the harvesting of personal or non-personal data. In addition, data may be harvested by devices (sensors) not connected to the Internet (e.g. image sensors, position sensors, temperature sensors, motion sensors, chemical sensors etc.), this data being digitised and thus commercially exploitable. The development of the Internet of Things (IoT) will increase the number of devices through which data may be harvested. IoT includes Machine to machine (M2M) communication, which used in the past embedded hardware modules and cellular or wired networks but is now relying directly or indirectly on IP-based networks to interface device data to a cloud or a middleware platform⁴³³³. The total installed base of Internet of Things (IoT) connected devices (sensors or actuators) is currently 26.66 billion devices and is projected to amount to 75.44 billion worldwide by 2025⁴³³⁴. The market for smart appliances in the context of smart homes may increase considerable the amount and type of data collected in the future⁴³³⁵. To these, one could also add self-driving cars, which may provide a gateway to a huge amount and variety of data. The number or degree of autonomy of self-driving cars is also increasing, with in addition to Tesla, a number of other companies, such as Honda, Nissan, Hyundai, PSA Citroen, BMW, ready to launch self-driving cars models in the next two years⁴³³⁶. As the number and types of devices able to harvest data increases, it becomes more difficult for a single player to control the physical infrastructure enabling the harvesting of data, thus establishing a bottleneck at the level of the physical infrastructure. The use of digital voice assistants, standalone or integrated, such as Amazon's Alexa, Apple's Siri, Microsoft's Cortana, Google Assistant, Yandex's Alice, Tencent's Xioawei, Alibaba's Aligenie, has multiplied in recent years with more than a third of the population in China, US, India, Brazil and Mexico owning such a digital assistant⁴³³⁷. The penetration rate of wearable medical technology and monitors, or implantable devices, is already 4.8% of the total global population, with more than 350 million users in 2019⁴³³⁸. The collection of data through IoT devices may enable a great degree of intrusion and the harvesting of types of data that were not previously available (e.g. heart rate monitors)⁴³³⁹.

The IoT relies on a different type of physical infrastructure: cloud computing. Cloud computing emerged in order to provide co-location services for data storage and computation. Resources (including control over data) move away from end-users, towards

centralized systems that possess huge processing power and storage capacities⁴³⁴⁰. The shift towards the Internet of Things ('IoT') will further revolutionise the medium as it makes possible, for the first time, an 'unconscious' use of the Internet and offers a new point of control, to the extent that most of the Internet use will occur through smart devices taking action on their own without direct human intervention. Indeed, those that control these devices will control the majority of Internet *use*, not just Internet access.

Cloud computing encompasses more than just infrastructure, for instance storage of data on shared remote servers that are hosted through the internet instead of the conventional local servers or personal computers, and is usually divided in three layers: Infrastructure as a Service (IaaS) delivers virtualised computing resources over a network connection and is of interest to network architects, Platform as a Service (PaaS) of interest to application developers, Software as a Service (SaaS) of interest to final users. The IaaS market, the fastest growing sector of the cloud computing market, was worth 38.9 billion U.S. dollars in 2019, with amazon Web Services (AWS) holding 34% of the global market, followed by Microsoft (Azure) (15%), IBM (7%), Google (7%) and Alibaba (4%)⁴³⁴¹, with Amazon, Microsoft and Google controlling 60% of the market. SaaS is the largest segment of the cloud computing market with a value of more than \$140 billion in 2019. A number of firms are active in this market, including Salesforce, LinkedIn, Concur Technologies, Workday, Inc., IBM, Oracle, Microsoft, Google, Zuora, with Microsoft the dominant player in the enterprise SaaS space with a market share of 17% worldwide in 2018, in particular after acquiring LinkedIn in 2016, followed by Salesforce with 12%, and a particularly strong position in cloud Customer Relationship management (CRM) technology, and then followed by Adobe, Oracle and SAP⁴³⁴².

The global market for cloud computing (IaaS, PaaS and SaaS) is moderately oligopolistic with a number of large players, such as Microsoft, Amazon, Salesforce, IBM, Oracle and SAP.

4340 P. de Filippi & S. McCarthy, "Cloud Computing: Centralization and Data Sovereignty", (2012) 3(2) European Journal for Law and Technology, observe that "(c)loud services, whether they're infrastructural, platform-based, or software as a service, present a fiction of decentralization to the user in the form of network effects, while the service is increasingly operated by large companies that leverage their position to limit interoperability. Because of their dominant position, large service providers can exert a degree of subjugation never conceived of by smaller and more local services, and a degree of control that would be impossible in a peer-to-peer network."

4341 See <https://www.statista.com/statistics/477277/cloud-infrastructure-services-market-share/>.

4342 See, <https://www.capacitymedia.com/articles/3822251/saas-market-up-32-to-over-20bn>.

Figure A.2.2. : Top Cloud Computing Vendors

Source: <https://www.appsruntheworld.com/first-look-at-2017-2022-paas-iaas-saas-markets-as-14-top-cloud-computing-billionaires-expand-across-enterprise-it/>

There has been a considerable increase in M&As in recent years in the cloud computing market, most involving acquisitions by Big Tech (more than 130 acquisitions between 1998 and 2018)⁴³⁴³. Although the market seems competitive, there are some firms growing exponentially more quickly than others (e.g. Microsoft, Amazon), the market exhibiting both direct and indirect network effects⁴³⁴⁴. This market may more easily tip to monopoly if important users, such as the State, conclude exclusivity agreements with one cloud provider⁴³⁴⁵.

4.3.4.1.3. Additional points of control: operating systems, application interfaces, app stores

Points of control moved from hardware to software in the early 1980s with the development of PCs and the strategies followed by IBM, the dominant player at the hardware segment of the value chain, and Microsoft, the rising star at the software segment. Cusumano, Gawer and Yoffie explain how the structure of the deal between IBM and Microsoft, for the latter to provide the operating system for IBM's PCs, was particularly

4343 AAI, Antitrust Review of Google's Acquisition of Data Analytics and Business Intelligence Startup Looker, (July 8t, 2019), available at <https://www.antitrustinstitute.org/work-product/aai-urges-the-doj-to-look-into-googles-proposed-acquisition-of-data-analytics-and-business-intelligence-startup-looker-highlights-rapid-consolidation-in-cloud-infrastructure/>.

4344 See, M. Cusumano, Technology Strategy and management – Cloud Computing and SaaS as New Computing Platforms, (April 2010) 53(4) Communications of the ACM 27, 28 (noting that 'SaaS and cloud computing platforms exhibit direct network effects to the extent they have specific application programming interfaces (APIs) or Web services that encourage application developers to tailor their applications or that make it difficult for users of these applications to switch platforms', although these network effects are not as powerful as those between Windows and applications written for PCs. He also observes that they also exhibit indirect network effects, 'to the extent that the popularity of one platform over another with developers makes the platform more attractive to other developers or users;', this also attracting final users).

4345 See, for instance, the recent controversy concerning the exclusivity cloud computing contract between the US Pentagon and Amazon or Microsoft: <https://www.ft.com/content/4ca4f7be-a4c3-11e9-a282-2df48f366f7d> (documenting the dismissal of Oracle's challenge to the projected contract on competition policy grounds).

significant for Microsoft to move the central point of control of the nascent PC industry to the operating system⁴³⁴⁶. Microsoft allowed IBM to use its MS-DOS operating system with no additional fees or royalty payments, as long as it was possible for Microsoft to license the same software to competing PC manufacturers. Cusumano, Gawer and Yoffie remark how Microsoft's approach reflects 'platform thinking' in the sense that Microsoft aimed to make the operating system 'an industry-wide platform', providing the 'foundation that many companies could use to build personal computers and compatible software applications'⁴³⁴⁷. If IBM, and its competitor Apple, were thinking about controlling a product market, PCs, 'Microsoft was thinking platforms'⁴³⁴⁸. This changes the way competition worked in the computer industry, as it became a platform business rather than a product business. The essence of the Microsoft's strategy was to develop a series of complementary innovations, adding significant value to the core product, the operating system, while ensuring that Microsoft's operating system was present in the quasi-totality of PCs, thus attracting developers. In this context, operating systems developed as the core point of control of the new PC hardware and software environment, which inevitably attracted the attention of competition authorities around the world in most of the 1990s and early 2000s⁴³⁴⁹.

4347 *Ibid.*, 4.

4348 *Ibid.*, 5.

4349 In the US, in 1991, the US Federal Trade Commission (FTC) launched an investigation on Microsoft. Staff recommends that the Commission brings a case focusing on Microsoft's licensing practices with personal computer manufacturers but FTC ends investigation in Feb 93 with a deadlock. In 1994, the US DOJ brought a complaint alleging that Microsoft used exclusionary and anticompetitive contracts with personal computer manufacturers to maintain an unlawful monopoly of personal computer operating systems. In 1995, USDOJ and Microsoft concluded a consent decree by which Microsoft agreed to abide by certain restrictions on its licensing arrangements. In 1997, US Judge Thomas Penfield Jackson issued a preliminary injunction barring the bundling of IE with Windows. In May 1998, the US government (USDOJ & FTC) brought an antitrust case against Microsoft alleging that the company had monopolized the markets for personal computer operating systems and browsers. They were quickly joined by the Attorneys General of 20 States and the District of Columbia. In May 1998, the US Court of Appeals for the DC Circuit reversed Judge Jackson's order ruling that the 1995 consent decree did not apply to Windows 98, which was shipped with an integrated IE as part of the operating system and an IE icon on the PC desktop. In April 2000, Judge Jackson issued his "conclusions of law" finding for the plaintiffs finding Microsoft liable for monopolization and anti-competitive tying of IE with Windows. In June 2000, Judge Jackson issued his remedies' decision splitting Microsoft in two separate companies, one active in operating systems for PCs, TV set-top boxes, handheld computers and other devices and a separate firm for other software and Web products--such as Outlook, Internet Explorer, BackOffice and the Microsoft Network (MSN). In June 2001, the US Court of Appeal Judgment overturned Judge Jackson's rulings against Microsoft, taking a more limited scope of antitrust liability approach, although it did not overturn the findings of fact, and remanded the case for consideration. In 2001 a consent decree signed between the US DOJ and Microsoft settling the dispute (USDOJ settlement). Nine States and the District of Columbia refused to settle. In November 2002, Judge Kollar-Kotelly issued a judgment accepting most of the proposed USDOJ settlement. In June 2004, the US DC Circuit approved the settlement. In Europe, in 2004, the European Commission adopted a decision declaring that Microsoft had violated Article 102 TFEU by committing two abuses of its dominant position on the market for PC operating systems (EU Microsoft I). Microsoft was held to have abused its dominant position by refusing to supply competitors with certain interoperability information and to allow them to use it for the purpose of developing and distributing competing products on the market for work group server operating systems. It also found that Microsoft had infringed Article 102 TFEU by making supply of its client PC operating system Windows conditional on the simultaneous ac-

The *Microsoft* cases put network economics to prominence in competition law, an important part of the debate in this case revolving around network effects. A market with network externalities is one where the value of being in the network is increased as others join it. Microsoft licenses more than 90% of the operating systems for personal computers (PCs). Consequently, there is a big incentive for consumers to use the Microsoft operating system, so that they can communicate with more people. Moreover, firms writing application programs, such as media players, to be used with an operating system will target the most popular system so as to increase their potential client base. It is costly in time and money to design an application to be compatible with additional operating systems. Consequently more applications are written to be compatible with Microsoft Windows and, in turn, this increases the inducement for consumers to take a license to use Windows. Once an undertaking has achieved a very large share of a network market, it becomes very difficult for competitors to challenge it, even if their technology is superior, as fewer applications are designed to be used with the new operating system and there are fewer clients with whom to communicate. The market 'tips' in favour of the incumbent. If only part of an industry is a natural monopoly, it may be possible to keep the rest of the market competitive. A competition authority has a strong incentive to act to prevent the monopolist of one part of the system extending its market power to other parts before those markets tip, too. If all the adjacent markets are supplied mainly by the same firm, it will be very difficult for a newcomer to challenge the original monopoly. A possible way out of the dilemma is the creation of middleware: a platform or software interface designed to be compatible with several operating systems, which can support many applications software. In that way, the applications compatible with the middleware can be 'ported' or used with any operating

quisition of its Windows Media Player (WMP). See, *Microsoft/W2000* (Case COMP/C-3/37.792) Commission Decision of 24 March 2004. The European Court of First Instance (GC), now the general Court of the EU, affirmed the decision of the Commission in 2007: see, *Case T-201/04 Microsoft Corp. v. Commission*[2007] ECR II-3601. Following complaints by Opera, the Norwegian Internet browser maker, in December 2007 the Commission initiated investigations and sent a Statement of Objection (SO) in January 2009 alleging a violation by Microsoft of Article 102 TFEU for tying its web browser Internet Explorer to its dominant client PC operating system Windows (EU *Microsoft II*). The Commission accepted the Redmond firm's commitments to offer a choice screen remedy for the allegedly anticompetitive practice of bundling the Internet browser software with the operating system software: see, *Microsoft (tying)* (Case COMP/C-3/39.530) Commission decision of 16 December 2009. Related to these cases a number of other investigations were opened against Microsoft either for not complying with the infringement decision of the Commission, or the commitments proposed by Microsoft and adopted by the Commission, or for ensuring the interoperability between the operating system Windows and other software products. Similar cases were brought in other jurisdictions, most prominently the US, but also South Korea. To these public enforcement led litigation, one should of course add the significant private antitrust litigation introduced brought against Microsoft by competitors, non-competitors and final consumers (class actions) mainly in the United States leading to private settlements amounting in 2014 to more than \$5 billion: see, Table 7.1. in Al Gavil & H First, *The Microsoft Antitrust Cases* (MIT Press, 2014), 260. See also, N Economides & I Lianos, 'A Critical Appraisal of Remedies in the E.U. Microsoft cases' (2010) 2 *Columbia Business Law Review* 346, 373–376. For a detailed book-length analysis of the Microsoft cases in the EU, US and globally see, WH Page & JE Lopatka, *The Microsoft Case – Antitrust, High Technology and Consumer Welfare* (University of Chicago press, 2007); L Rubini, *Microsoft on Trial – Legal and Economic Analysis of a Transatlantic Antitrust Case* (Edward Elgar, 2010); Al Gavil & H First, *The Microsoft Antitrust Cases* (MIT Press, 2014). Of course the bibliography on the Microsoft cases is vast

system. Besides being an operating system Windows was such a platform, but there were also other platforms that relied on different operating systems, such as Linux, Mac OS, or web servers/web browsers, on which software applications could also be written without the need to pass by Windows. The core of the allegations against Microsoft was that the Redmond-based company sought through exclusionary practices and predatory pricing to create a high barrier to entry in the platform market as it perceived a threat to its Windows monopoly from other middleware/platforms, in particular web server/web browser platforms, to the extent that the use of the Internet developed. In the US case, it was alleged that Microsoft had made it difficult for Netscape and Java, which might have become middleware, to expand sufficiently. Different views were expressed by economic experts on the possible effects of these practices on consumers and innovation.⁴³⁵⁰ Similar strong platform dynamics did not only develop in the context of the PC industry, but also in other ICT industries, such as the game console industry during the same period⁴³⁵¹.

The rise of the Internet led to the establishment of new points of control, such as search engines. Competition authorities have been quite active recently in the search engine segment, not only for the PC value chain but also for the smartphone value chain, to the extent that most Internet access now occurs through smartphones. In 2011, the US Federal Trade Commission considered opening a case against Google in particular for allegations that Google had manipulated its search algorithms to harm vertical websites and unfairly promote its own competing vertical properties (search bias). However, and it seems contrary to the recommendations of the FTC staff that have investigated the case for two years⁴³⁵², the FTC leadership reached an agreement with Google a January 2013 settling the case after concluding that

‘[u]ndoubtedly, Google took aggressive actions to gain advantage over rival search providers. However, the FTC’s mission is to protect competition, and not individual competitors. The evidence did not demonstrate that Google’s actions in this area stifled competition in violation of U.S. law’⁴³⁵³

Regarding the specific allegations that Google had biased its search results to hurt competition by vertical search competing with its own websites (comparison websites, maps etc.), the FTC found that the evidence collected did not justify legal action. However, the FTC required some changes with regard to some of Google’s business practices, although noting relating to the Google’s search engine, Google accepting not to seek injunctions to block rivals from using patents essential to key technologies and to remove

4350 For an interesting early analysis of the different economic views put forward by the experts hired by the parties in the US litigation, see D Evans, F M Fisher, D L Rubinfeld & R L Schmalensee, ‘Did Microsoft Harm Consumers? Two Opposing Views’ (1st, AEI-Brookings Joint Center for Regulatory Studies, Washington 2000). See also, R Gilbert & M Katz, ‘An Economist’s Guide to U.S. v. Microsoft’ [2001] 15(2) *Journal of Economic Perspectives* 25.

4351 See, M.T. Clements & H. Osashi, Indirect network effects and the product cycle: Video games in the US, 1994-2002, (2005) 53(4) *Journal of Industrial Economics* 515.

restrictions hampering advertisers' management of their ad campaigns across competing ad platforms.

In subsequent cases, the European Commission found that the unfavourable treatment by Google of competing vertical search service providers in Google's unpaid and sponsored search results coupled with the alleged preferential placement of Google's own services and the demotion of **rival comparison shopping services in its search results** constituted an infringement of Article 102 and an abuse of Google's dominant position⁴³⁵⁴. Google used universal search as a bottleneck to expand its dominant position in vertical search. Similarly, the Russian FAS⁴³⁵⁵ and the European Commission⁴³⁵⁶ condemned the tying strategies employed by Google that also involved the tying of its search engine with other applications.

The development of a new devices for consumers to access the Internet, as they moved from using PCs to predominately having access to the Internet using mobile telephony, led to the development of new points of control in the digital economy⁴³⁵⁷. The widespread use of smartphones or the development of tablet computers have led to the transition from browsers to apps.⁴³⁵⁸

Competition does not take place on a specific product but at the level of a complex ecosystem which includes the core digital platform and a number of complementors: app developers, network operators and device manufacturers⁴³⁵⁹. There is no more one product but an ecosystem of various complementary products, such as a mobile device, an operating system, an online marketplace for apps and content, apps, services and network etc. This emphasizes interconnectivity along all the elements of the ecosystem and 'offers many potential bottleneck locations': indeed, as some authors put forward, '(d)etermining the optima control point is shaped by the firm's core competencies, and therefore will vary across firms'⁴³⁶⁰. Firms make a strategic use of their application programming interfaces (APIs) which enable external apps to connect with the operating

system, hardware or web-based system, and ensure interconnectivity and interoperability.

Of particular interest in the development of new bottlenecks is the move of Google to launch its operating system Android for smartphones, built on top of a Linux kernel, and its licensing without royalties under open-source terms in 2008. This enabled a wide range of handset makers to enter the smartphone market without having to develop their own operating system. The fact that Google provided the basic Android source code without certification restrictions for anyone to download and modify, along with the founding of the Open Handset Alliance, commoditized the operating system and transformed Android to a platform on which other firms could build their own proprietary platforms. Indeed, the Android Open Source Project (AOSP) was later customized by companies with smartphone devices, or game consoles, which were able to launch Android forks (e.g. Amazon's Fire OS, Nokia X Software Platform and a significant amount of forks in China). In addition, Google licensed for free its Google Mobile Services software, along with Android trademarks, only to hardware manufacturers for devices that meet Google's compatibility standards specified in the Android Compatibility Program. The Program defines technical details of the Android platform and provides tools for OEMs to ensure developer applications run on a variety of devices⁴³⁶¹. A number of major OEMs, such as Acer, Dell, Fujitsu, HTC, Huawei, Lenovo, Samsung, ZTE etc., have enrolled in this programme, which enables the use of the Google's APIs offering access to Google services, such as Gmail, Google Maps, and the Google Play marketplace. In contrast to Apple or Microsoft, Google did not try to monetize the OS directly, but employed a different business model relying on selling adverts.

Despite the Android Compatibility Program, the diverse Android ecosystem, in contrast to a fully proprietary integrated operating system, may face some fragmentation issues, in particular if it is necessary to update regularly the different versions of the operating system, that could affect the experience of users. Instead of acting on the operating system, on which because of its open-source status Google had relinquished control, it chose instead to develop a proprietary system application called Google Play Services transferring as much functionality from the operating system to Google Play Services (GPS). GPS is deeply integrated into the core OS functionality, as Google transferred APIs from the OS to GPS, so that it can update automatically, without any action by the user, OEMs or the network operator. This ensures that Google updates its APIs by pushing a new version of GPS to the Android certified compatible devices. This has profound implications as to the emergence of a new point of control, as the 'interface, or API, has taken primacy over the core functionality'⁴³⁶². This led a number of authors to conclude that 'control of the APIs may be more important than control of the operating system itself'⁴³⁶³. Google's strategy 'de-valued the OS as a potential bottleneck' and 'strategically

4361 See, <https://source.android.com/compatibility/overview>.

4362 B. Pon, T. Seppälä, M. Kenney, Android and the demise of operating system-based power: Firm strategy and platform control in the post-PC world, (2014) 38 Telecommunications Policy 979, 982.

4363 B. Pon, T. Seppälä, M. Kenney, Android and the demise of operating system-based power: Firm strategy and platform control in the post-PC world, (2014) 38 Telecommunications Policy 979, 987.

used the Android APIs in order to promote the use of the GPS, thus by the same affecting the functionality of its competing Android-based forks.

App store centres become an important new point of control, and thus a possible bottleneck, as Internet access through smartphones enables ‘the majority of Internet-mediated practice’ to be undertaken ‘with devices that are either narrowly customizable appliances or controlled on the app store model’⁴³⁶⁴. The recent complaints of Spotify against Apple’s app-store led Apple to revise the principles of its store and to adopt ‘App Store Review Guidelines’⁴³⁶⁵. Apple collects a commission from developers when a digital good or service is delivered through an app. This is set at 30 percent of the app subscription fees for using Apple’s payment system the first year a customer is signed up for and 15 percent for each year thereafter. Following a complaint from Spotify, a Swedish media-services provider, which alleged that this commission applies to Spotify and other music subscription services that may compete with Apple’s music platform iTunes, but not to other apps it has been reported that the European Commission is envisaging to launch a formal investigation procedure⁴³⁶⁶. Similarly, in a 5 to 4 judgment the US Supreme Court had agreed with the Ninth Circuit Court of Appeals’ decision in *Apple v. Pepper*, holding that four iPhone owners and Apple app buyers could sue the company for allegedly driving up prices by setting the retail price of the apps, and charging a 30% commission on every app sale, the company having unlawfully monopolised the aftermarket for iPhone apps, finding that the iPhone owners were direct purchasers because they purchased apps directly from Apple.⁴³⁶⁷

These developments show that the platform bottleneck may move to higher layers and would not necessarily involve, for instance, strategies of tying or bundling of certain services with operating systems but the tying of services to each other or between the services and new points of control, such as the app store or the cloud. Indeed, leading app stores may constitute significant barriers to new entry. During the second quarter of 2019, Apple’s App Store remained the second-largest app store with almost 1.96 million available apps (see Figure A.2.3.).

Source: <https://www.statista.com/statistics/276623/number-of-apps-available-in-leading-app-stores/>

Applications generate revenue in a number of different ways, such as [charging](#) users a small amount of money for the use of an app (an average of 1.02 U.S. dollars per app in the Apple Store), charging for access to premium features of an otherwise free app or simply selling ad space⁴³⁶⁸.

4.3.4.1.4. Algorithms and AI as a bottleneck

Data may constitute an essential bottleneck but to the extent that it is a public good and therefore not subject to rivalrous consumption, their exclusionary potential depends on more specific characteristics of the data itself (for instance, some data are more difficult to harvest than others in view of data protection laws or other protective regimes) and the available technologies to harvest them (which may be covered by IP rights). However, the exploitation of this data through the development of sophisticated algorithms may also constitute an important bottleneck. This is in particular the case in view of the possibility that algorithms may be protected by IP rights, thus providing the IP holders the right to exclude others from their use. The highly evolving field of technologies of Artificial Intelligence (AI) may constitute a bottleneck in the future, in view of the expansion of AI techniques and their use in various application fields. Introduced by British scientist Alan Turing as a concept in a 1950 paper, and coined as a term by the American computer scientist John McCarthy during the Dartmouth Conference in 1956, AI techniques include machine learning, probabilistic reasoning, fuzzy logic, logic programming and ontology engineering, allowing the computation of tasks typically performed by humans⁴³⁶⁹. These are used for a number of functional applications, such as robotics, natural language processing, speech recognition, predictive analytics, planning and

4368 See, <https://www.statista.com/statistics/276623/number-of-apps-available-in-leading-app-stores/>.

4369 WIPO, Artificial Intelligence – Technology Trends 2019 (WIPO, 2019), 24.

scheduling, computer vision, knowledge representation and reasoning, among others, while deep learning constitutes the fastest growing AI technique, as inferred from an increase in AI patent applications⁴³⁷⁰. AI has an expanding scope of application in various fields of economic and social life, from business to government and the arts⁴³⁷¹.

Algorithms (or smart data) will transform the production of goods and services in all industries, the 'AI wave' catching up an increasing number of economic sectors, in particular transportation, telecommunications, and life and medical sciences. The most popular AI functional applications include computer vision, natural language processing and speech processing⁴³⁷². It is projected that the global artificial intelligence software market will experience massive growth, with revenues increasing from around \$9.5 billion in 2018 to an expected \$118.6 billion by 2025⁴³⁷³.

It is noteworthy that the economic and business context of AI is characterised by the patent activity of a small number global corporations, as well as of a few university or public research organizations, as well as by an increasing amount of M&A transactions, in particular acquisitions of AI start-ups and more mature firms by Big Tech. As a recent WIPO report explains, 'companies represent 26 of the top 30 patent applicants', most of them being Big Tech conglomerates, with just four of the top 30 being universities or public research organizations. From the corporations, IBM holds the largest portfolio of AI patents (with 8290 applications), followed by Microsoft (with 5930 applications), Toshiba and Samsung⁴³⁷⁴. Key players in the deep-learning area include the Chinese corporation Baidu, followed by Alphabet, Siemens, Xioami, Microsoft, Samsung, IBM and NEC⁴³⁷⁵. From the top 20 universities and public research organizations active in AI globally, 17 are based in China, with the largest portfolio belonging to the Chinese Academy of Sciences (CAS)⁴³⁷⁶. However, a more careful analysis of patent applications shows that IBM and Microsoft rank first and second in most AI techniques, with also some significant presence from some leading entities in China (e.g. the State Grid Corporation of China (SGCC), Baidu, as well as the CAS) (See Figure A.2.4.)⁴³⁷⁷. India and Russia have enjoyed a high rate of annual growth for first filings in recent years⁴³⁷⁸.

AI Patent applications have increased exponentially the last few years, the greatest number being filed in the US and China, although India is also among the top 10 jurisdictions (see Figure A.2.5.). Note also the position of Brazil (no 14), Russia (no 16) and South Africa (no 25). However, although the US filings are either first or second filings, attracting applications from other jurisdictions (in view of the importance of the US market), the majority of filings in China are made by Chinese patentees, which may indicate that Chinese applicants are more interested in the domestic rather than overseas market⁴³⁷⁹.

The issue of patentability of AI can be set in different terms in the various jurisdictions, and in particular China, the US and the EU, due to some specific limitations to the patentability of software (including AI techniques)⁴³⁸⁰. Section 101 of the US Patent Act, in defining the subject matter eligible for patent protection, contains an implicit exception for '[l]aws of nature, natural phenomena, and abstract ideas'. In applying this exception, the Supreme Court distinguishes between patents that claim the 'buildin[g] block[s]' of human ingenuity, which are ineligible for patent protection, from those that integrate the building blocks into something more, thereby "transform[ing]" them into a patent-eligible invention⁴³⁸¹. In *Alice v. CLS Bank International*, the Supreme Court implemented these principles to patent claims directed to a computer-implemented technique of

4381 *Mayo Collaborative Services v. Prometheus Laboratories, Inc.*, 142 S.Ct. 1289 (2012).

intermediating settlements in the context of financial transactions⁴³⁸². The Court first found that the concept of intermediated settlement was an abstract idea and constituted a fundamental and long-prevalent economic practice in the system of commerce. It then held that claims that ‘require generic computer implementation, fail to transform that abstract idea into a patent-eligible invention’⁴³⁸³. Hence, the fact that the well-established concept of intermediation is performed by a generic computer was not sufficient for making the claims eligible for patentability. It should also have been necessary to provide evidence that the technology improved the functioning of the computer or any other technology or technical field.

Under the joint *Mayo/Alice* test, courts should first assess if, on the whole, the claims are ‘directed to’ patenting an abstract idea, before, in the second step, considering whether the claims contain “an inventive concept” that would transform the nature of the claim into a patent-eligible application. According to the Court, the claim should contain “an element or combination of elements that is sufficient to ensure that the patent, in practice, amounts to *significantly more* than a patent upon the [ineligible concept] itself”. Such would be the case, if the claim limitations “involve more than performance of well-understood, routine, [and] conventional activities previously known to the industry”. This requirement of ‘significantly more’ contribution than the use of a generic computer implementation is assessed on a case by case basis by the courts. In subsequent cases applying the *Mayo/Alice* test for AI, the US courts have been quite narrow in their assessment of the criteria invalidating patent claims. For instance, in *Purepredictive, Inc. v. H2O.AI, Inc.*, the United States District Court for the Northern District of California held that the asserted claims of a US Patent covering AI-driven predictive analytics were ‘directed to a mental process and the abstract concept of using mathematical algorithms to perform predictive analytics’ that ‘do not make a specific improvement on an existing computer-related technology’⁴³⁸⁴. Similarly, in *Blue Spike, LLC v. Google Inc.*, the District court for the Northern District of California invalidated patent claims for covering a general purpose computer implementation of ‘an abstract idea long undertaken within the human mind’ because they sought to model ‘the highly effective ability of humans to identify and recognize a signal’ on a computer and they merely covered ‘a wide range of comparisons that humans can, and indeed, have undertaken since time immemorial’, thus lacking any ‘inventive concept’⁴³⁸⁵. This constructed narrowly the scope of patentability of AI. Further insights were brought by the recent USPTO guidelines⁴³⁸⁶.

In the EU, although computer programs ‘as such’ are, in principle, excluded from patentability in view of Article 52(d)(2) of the European Patent Convention which creates an exception to their patentability, by virtue of the interpretation of Articles 52(d)(2) and

4386 See, USPTO, 2019 Revised Patent Subject Matter Eligibility Guidance, (January 7, 2019), available at <https://www.govinfo.gov/content/pkg/FR-2019-01-07/pdf/2018-28282.pdf>.

52(d)(3), software-based patents may be eligible to patentability if the claimed subject-matter has a technical character. The European Patent Office ('EPO') has already granted thousands of patents related to software-based technologies and a quite complex, and not necessarily clear, jurisprudence of the Technical Boards of Appeal of the EPO has attempted to interpret the limits of patentability in this area⁴³⁸⁷. With regard to AI, the EPO recently published Guidelines for the examination of AI and machine learning which provide guidance on the assessment of whether an invention on AI and machine learning has the requisite 'technical character' so as to be patentable⁴³⁸⁸.

AI may also be protected by copyright, or as a trade secret, although these provide less exclusionary potential than patents and the constitution of a bottleneck, to the extent that only patents exclude the use of an idea, and not just the expression of an idea as it is in copyright law, that is covered by the scope of the patent.

Copyright can only protect the work of 'authorship' and this involves that the work must be created by a human being. Hence, this excludes machine-generated AI. Concrete computer programs for processing data are already protected by the copyright law of the EU Member States implementing Directive 2009/24/EC⁴³⁸⁹. However, this protection does not cover the functionality of a computer program⁴³⁹⁰ or the underlying general algorithm (understood as a set of rules to solve a problem step by step, independent of its expression and representation, e.g. the description of the steps to be made for analyzing or filtering data and the criteria to be applied). According to Drexler et al. This is already implied by Recital 11 of the 2009/24/EC Directive, which clarifies that copyright protection for computer programs should not extend to the 'ideas and principles which underlie any element of a program'.

Trade secret protection arises automatically to the extent that the trade secret owner shows that the information creates a competitive advantage by virtue of its secrecy and that reasonable measures have been taken to maintain its secrecy. Trade secret protection has recently gained in importance in order to protect technology, such as AI, with the creation by the 2016 Defend Trade Secrets Act (DTSA) in the US a federal civil cause of action for trade secret misappropriation⁴³⁹¹, as well as the recent EU trade secret directive⁴³⁹².

The specific regime instituted by the EU Database Directive does not cover algorithms. Although Article 1(2) stipulates that a "database" shall mean 'a collection of independent

works, data or other materials arranged in a systematic or methodical way and individually accessible by electronic or other means', art 1(3) stipulates that '(p)rotection under this Directive shall not apply to computer programs used in the making or operation of databases accessible by electronic means'.

The patentability of AI has not been thoroughly discussed in China. Furthermore, Chinese copyright law excludes machine-generated works from copyright protection. In the first Chinese case addressing the copyright protection of AI-generated work, *Beijing Feilin Law Firm v Baidu Corporation*, the Beijing Internet Court decided that only works created by humans are eligible.⁴³⁹³ An interesting counterpoint to the Chinese model within the BRICS context is offered by India, where authorship, and therefore copyright protection, is attributed to the creator of the AI itself.⁴³⁹⁴

A second interesting development in the business and economic context of AI is the rise of acquisitions of small and more mature start-ups, in particular by US-based Big Tech, the number of acquisitions in the AI sector increasing by 33% between 2012 and 2017⁴³⁹⁵. The top acquiring companies include Alphabet, which accounts for 4% of acquisitions overall, Apple, Microsoft, Verizon, Amazon and Cisco⁴³⁹⁶. Companies from China and India are less well represented in acquisitions than they are in the number of publications or patent filings. Most of the companies acquired are in the US and the UK.⁴³⁹⁷ These US Big Tech companies are also the top litigation defendants, the amount of patent litigation rising in this area.

It is too early to say if the relative importance of a small number of Big Tech, and their aggressive expansion through acquisitions will tip the market in some AI functionalities to their benefit, as well as how network effects, learning effects and increasing returns to scale and scope may play in this specific context, in conjunction with IP protection and the competitive advantage it provides. Depending on the implications of the development of M&As and patenting in this area, a possible future bottleneck may arise.

4.3.4.1.5. Blockchain: towards a decentralization and disintermediation for the digital economy?

The Internet era gave rise to online intermediaries and digital platforms controlling and orchestrating value-generating ecosystems that not only offered products and online

services but also provided the infrastructure and tools on which other platform businesses can be built. In contrast, blockchain technology has been widely perceived as promising a decentralised and largely disintermediated model of organisation of the digital economy that would dispense with intermediaries and, consequently, the risk of monopolistic bottlenecks. While in the digital platform model only the centralised online platform collects information about past transactions, blockchain offers a distributed decentralised ledger, which keeps a complete record of all past transactions on the network. This enables all participants to have access to information about past transactions and, thus, ensures that no participant to the network enjoys a position of superior bargaining power due to informational asymmetries. This equality is furthered by the transparency of the process: each new transaction is broadcast to the entire network and each participant has the power to determine its authenticity. This breaks with the centralised data silos model of the platform economy, where only some actors have access to this information, as all interactions between the network participants happen through them, thus, enabling them to accumulate data, which, in turn, can help them to increase their bargaining power and to erect barriers to entry.

Of course, blockchain is not a monolith. There exist various types of blockchain, some of which are closer to the centralised ledger model of digital platforms. It is customary to distinguish 'private' or 'federated' blockchains from 'public' blockchains.

A private blockchain is controlled by a centralised entity, like an Intranet. Only the entity controlling the blockchain has the possibility to approve participants, to read and/or write new blocks and to validate the transactions. The entity also benefits from information concerning the identity of the participants. As with digital platforms, users are free to leave a platform in the case that competitive alternatives exist. However, it should be noted that contrary to digital platforms, each participant maintains a replica in sync of the ledger of digitally signed transactions, thus, guaranteeing the immutability of the blockchain. Private blockchains are transparent and can be read in real-time by a regulator.

Federated blockchains are private blockchains managed by a consortium of multiple organisations. As with private blockchains the participants are identified and pre-approved by the entity that manages the blockchain. The consensus process is controlled by a pre-selected set of nodes. R3 constitutes an example of an open-source and federated distributed ledger controlled by a consortium of more than forty financial companies and an ecosystem of more than 200 companies. R3 was put in place in 2015. Its aim was to develop apps for finance and commerce capable of running on its blockchain platform, Corda. The objective was to replace complex legacy systems that could not handle complex transactions and suffered from interoperating difficulties. Private or federated blockchains are usually permissioned, although one cannot exclude the possibility of a 'permission-less', private or federated blockchain (e.g. a Byzantine agreement)⁴³⁹⁸.

4398 A 'Byzantine agreement' or 'Byzantine fault tolerance' exists where participants to the blockchain, which are known and who possess a public key agree on a concerted strategy to sign with their public key, validating a block as it passes through their node. Once a predefined number of participants sign the block, this is deemed valid and added to the chain.

Public blockchains are closer to the decentralised model and are characterised by free entry: anyone may contribute to it by adding a block, execute the consensus protocol and/or maintain the shared ledger. Public blockchain protocols are open source. In principle, anyone can download the protocol and validate transactions. In this context, the blockchain is considered to be 'permission-less' (e.g. Bitcoin). There is also the possibility that, although in principle open to any participant, the participant should satisfy some conditions. The imposition of such would qualify the public blockchain as 'permissioned'. For instance, anyone can develop a decentralised application ('DApp') on Ethereum *so long as* they purchase some Ether (the native token of this blockchain). The network provides an incentive system in order to encourage more participants to join. This is done with either the release of native tokens or the payment of commission fees to miners and other developers for each transaction added to the chain. Due to its openness and the risk of double spending, public blockchains need an identity management system. This system enables the participants to the blockchain to achieve consensus. Each node in the network must solve a complex, resource-intensive cryptographic problem ('proof of work') or other mechanisms of pre-approval (e.g. 'proof of stake' etc.) for a new block to be added to the blockchain.

The use of blockchain technology offers numerous advantages, in comparison to interacting across different networks. First, it facilitates the organisation of micro-transactions. There is no need for a centralised network intermediating all transactions nor for administration costs to be incurred for each additional transaction. Blockchain may enable direct transactions to take place between the various nodes of a network, without being necessary for these to be administered from the centre of the network. This greatly reduces transaction costs. Consequently, micro-transactions that were too expensive to organise in the context of a centralised network because their value was lower than the administration costs are now, due to the much lower administrative costs of DLT, economically rational. Blockchain can thus charge lower fees than that which platforms usually charge.

Second, all transactions that run through blockchain benefit from in-built network neutrality, to the extent that the only criterion for processing a transaction is whether the appropriate fee has been paid. Contrary to platforms, it is not technically possible for an entity to either control the traffic in the blockchain network and/or differentiate the way in which various transactions will be executed in terms of speed, quality etc. In comparison to neutrality arising from the structure of a blockchain network, for digital platforms neutrality obligations are usually mandated by law⁴³⁹⁹.

Third, once a transaction is 'mined' into a block, after a certain period of time it is nearly impossible to reverse it because it would mean that you would have to re-mine the block and all the other blocks added on top of that; this computationally intensive operation would incur high costs that would likely be disproportionate to the value of

4399 See, for instance, the 2017 Google Search (Shopping) competition law, Case AT.39740, in the EU, regarding search neutrality, or the Proposal for a Regulation of the European Parliament and of the Council on Promoting Fairness and Transparency for Business Users of Online Intermediation Services, 2018/0112 (COD), imposing neutrality requirements in the way digital platforms treat other websites and other businesses with regard to ranking etc.

reversing the original transaction. Transactions in blockchain thus become irreversible, and this reduces the risk of manipulation of the data by an operator, a risk that is very much present with regard to digital platforms.

Fourth, everybody can check the public ledger and verify whether the transaction took place or not, the identity of the sender and the locations between which the value was transferred. The transparency of the blockchain offers significant advantages to platforms when organizing a network of transactions, as transparency generates institutions-based trust, without that relying on the power of control exercised by an intermediary, as it is the case in platform-based networks. This has also profound implications as to the ability of each participant to this network to feel as though they are in control. One of the main features of blockchain-based applications is that users have absolute ownership of their assets (e.g. money, data etc.) without the need for any kind of custodian (e.g. banks, online intermediaries etc.). Thus, once someone generates a private key, no other person can claim the assets, confiscate them or deny access to them.

Fifth, blockchain leads to a reduction of economies of scale and network effects. These well-known features of digital platforms, to a large extent, explain the higher levels of economic concentration in the platform economy. New technologies require important investments and fixed costs for their development, which often lead to network effects (i.e. the use of a product or service by any user increases the product's value for other, potentially all, users). Indeed, the value of the product to one user is positively affected when another user joins and enlarges the network (i.e. 'positive network externalities'). For instance, an additional user of a search engine may increase the quality of search provided by this search engine because the search engine with its increased stock of queries can, through the data stemming user's expressed preferences, seek to better tailor the results displayed to the user. In turn, this process has the capacity to benefit all users. This 'positive feedback loop' mechanism explains the reason for these markets being so tippy and being characterized as 'winner-takes-most' competition. For instance, there might be fierce competition to conquer a market share advantage over rivals, with regard to the specific technology or standard applying in the industry, as the market may switch almost completely to the winner ('competition for the market').⁴⁴⁰⁰ Quite often, these products or services constitute a package of complementary products and technologies, which form a system competing with other systems ('systems competition').⁴⁴⁰¹ The value of the product does not always depend directly on the number of adopters but on the adoption of some complementary products that are bundled or packaged with the first product (think about a book reader and the content of the book).

Network effects lead to collective switching costs and lock-in effects, which reduce competition and may entrench the dominant position of the winner for a significant period

4400 Usual examples include the videotape format war between VHS and Sony's BETAMAX, or the competition between Windows and Intel from one side and Apple from the other for the microcomputer market. For an analysis of competition in open and closed systems see Competition and Markets Authority (UK) and Autorité de la Concurrence (France), "The Economics of Open and Closed Systems", (2014) Report.

4401 Michael Katz and Carl Shapiro, Systems "Competition and Network Effects" (1994) 8(2) Journal of Economic Perspectives, 93.

of time. Firms are quite imaginative in their business models, sometimes distributing the product for free on one side of the market, thereby inducing more users to join the network and, thus, increasing the value of the product for other users situated on the other, paying side of the market with this (multi or two-sided market) platform facilitating the interaction between these two different customer groups. Firm may also use various business practices, such as penetration pricing, where they charge low prices (even below their costs) to gain market share, or strategic bundling of their products in order to gain a foothold in another market prior to expanding its market share in this latter market. In these latter markets, it is possible that firms may incur losses for a significant period of time in order to invest in acquiring market share (either through natural growth or by buying out actual or potential competitors) or in order to constitute one-stop-shop solutions or essential platforms for various groups of customers. Competition between firms takes on unexpected forms, such as competing for consumers' attention (or eyeballs), eventually profiling them and using algorithms in order to predict and possibly manipulate their behavior.⁴⁴⁰²

Blockchain leads to lower network costs "both in the phase of bootstrapping a new platform and in the phase of operating it"⁴⁴⁰³. With regard to the advancing of a new platform, it is unclear if the development of a blockchain requires lower fixed costs than setting up a traditional centralised platform. Blockchains rely on a number of miners running a cryptographic program in order to verify the authenticity of the transactions in the decentralised ledger. The first generation of blockchains ('blockchain 1.0') relied on the proof of work ('PoW') concept. It required the use of the highest number of CPUs to validate a block. Miners had to go through more computational work in order to prove that a transaction hash is legitimate: the more computers used, the stronger the authenticity of the ledger becomes ('one CPU, one vote')⁴⁴⁰⁴. Miners running the cryptographic program start from the final hash of the current block hashed with the previous block searching for the answer to this mathematical puzzle (the 'proof string'). Once a miner discovers the correct proof string, this is broadcast to the rest of the network of other miners active on the system who will verify if all the transactions are valid and that the proof string broadcasted has, in fact, solved the puzzle. The number of verifications a string receives counts as votes leading the block with the highest number of verifications to win and, thus, to be officially added to the chain. The reward is released as soon as a new block is added to the chain. This can either consist on a coinbase reward (a native token that compensates the miners) or, in view of the diminishing returns of the coinbase reward, a fee (e.g. a percentage of the transaction). PoW thus relies on compe

4402 F. Pasquale, *The Black Box Society – The Secret Algorithms that Control Money and Information* (Harvard University Press, 2015).

4403 C. Catalini & J. Gans, "Some Simple Economics of the Blockchain", (2017), Rotman School of Management Working Paper No. 2874598, MIT Sloan Research Paper No. 5191-16, 12.

4404 Satoshi Nakamoto, "Bitcoin: A Peer-to-Peer Electronic Cash System" (2008), <<https://bitcoin.org/bitcoin.pdf>>, 3, explains that "(i)f the majority were based on one-IP-address-one-vote, it could be subverted by anyone able to allocate many IPs. Proof-of-work is essentially one-CPU-one-vote. The majority decision is represented by the longest chain, which has the greatest proof-of-work effort invested in it".

tition between network participants (i.e. 'miners') on who will be the first one to validate the transaction.

PoW enables trustless consensus to develop by deterring attacks to the blockchain. This is done by raising the costs of an attack, as a successful attack requires a lot of computational power and a lot of time to do the necessary calculations. Miners perform a lot of calculations in order to generate blocks and maintain the security of the chain. Their role is to ensure the legitimacy of a transaction by avoiding any double-spending. The asymmetry of computational power required by those requesting the addition of a new block in the blockchain, in comparison to the rest of the network, means that, on average, a higher number of calculations needs to be performed each time in order to create a new block. Hence, the more the blockchain grows, the more hash and computational power algorithms are needed in order to generate consensus. The difficulty of the hash depends on the number of users, the network load and the current computational power used. The algorithm rewards the first miner that has completed this extra computational work and has solved this increasingly difficult mathematical problem thereby enabling the creation of this additional block or the release of the commission fee.

This computational work involves the consumption of a lot of electricity power and the use of computer hardware only focused on maintaining the operation and security of the blockchain. In addition to these variable costs, blockchain involves high fixed costs concerning storage. Contrary to platforms that may store information on the cloud, by paying a monthly fee for cloud storage, blockchain 1.0 projects require the storage of data indefinitely and, hence, must opt for paying upfront the storage costs. This, in turn, increases fixed costs, which could be considered as a barrier to entry for newcomers. The shift from centralised to decentralised cloud computing with data being maintained on both public and private clouds, may, nevertheless, reduce the costs of storage and the significance of this entry barrier. The PoW model is also risky as it may be subject to the '51% attack'. This may occur if a miner or pool of miners have attained 51% of the computing power thereby providing them the ability to re-write the entire blockchain. Although this could easily be observed by other participants of the network and could result in the value of the native token of the blockchain collapsing, the attackers may have more to win than to lose, as they may not own any of these native tokens. The risk of centralisation is particularly high when the mining activity is concentrated among a limited number of entities or pools, as is the case for Bitcoin mining, because of the costs engendered by the PoW approach.

The high costs of the PoW concept led the second-generation ('blockchain 2.0') projects (based on Ethereum) to switch to the proof-of-stake ('PoS') approach which requires far less computational power and, thus, far less electricity for the creation of cryptographic proof. In contrast to PoW system, which takes into account the amount of CPU devoted to the system, in a PoS system it is not the amount of computational power one is willing to spend in order to confirm the legitimacy of the block that counts for the payment of the reward. Rather the creators of a new block are chosen in a deterministic way that depends on the 'stakes' they hold. The weight to their vote is proportional to the

ownership stake they hold. For instance, a miner holding 2% of the total Bitcoins may have the possibility to mine 1% of the blocks. In PoS, miners are mostly rewarded with transaction fees. The system is preserved from double spending and attacks by the fact that a cyber-attack, for instance, by someone holding 51% of the computational power of the network may affect the value of the specific digital asset held with the result that it would make it disadvantageous to attack the network. The majority stake owner is therefore incentivized to maintain a secure network. This system drastically reduces the costs linked to the use of computational power (e.g. energy costs). However, such system may risk being exposed to the potential for a miner, or a group of miners, to monopolise it, to impose conditions on the rest of the network, which could involve the adoption of exploitative practices or leveraging practices in related markets. Hence, although the PoS approach is more secure than the PoW approach with regard to the risk of a 51% attack, given the importance of the stakes of the miners in preserving the value of the blockchain's assets, one cannot categorically exclude the possibility of abuse.

The incentives of the developers also differ between digital platforms and blockchain. Platforms rely on the indirect network effects they generate to incentivise developers to write applications for their (dominant) platform, as higher consumer use of a platform makes the platform more valuable for producers (this is called 'cross-side network effects'). Blockchain relies on an incentive system based on the venture capital model whereby early contributors earn tokens for providing the resources (capital and time) needed for the operations of the platform⁴⁴⁰⁵. Developers are attracted by the prospect of potential future profits generated by the appreciation in value of the native token, once the ICO is completed. Following the initial process of development of the blockchain, miners are initially compensated with native tokens; later they are compensated with the payment of transaction fees.

An important difference between the traditional centralised platform model and blockchain is that users of the latter are less anchored to the specific platform because of the risk of losing the data it contains. This may harm the users to the extent that the harvesting of data contributes to higher performance, as, for instance, search results become more personalised and irrelevant advertising is excluded. An important feature of blockchain is that information is distributed in a decentralised ledger and it is possible for anyone (in the case of public blockchain), or for a number of participants (in the case of a permissioned blockchain) to have access to it, particularly if they decide to switch to a different platform or blockchain 'fork'. Contrary to centralised platforms, where users are averse to switching, the replicability of data makes it easier for blockchain to switch to competing forks and abandon the older version of the blockchain⁴⁴⁰⁶. This has also important implications for indirect network effects, as blockchain developers (writing apps) and blockchain operators (e.g. miners) also have less reasons to be anchored to a specific platform. It is in their interest to be among the first to contribute to a fork be-

4405 C. Catalini & J. Gans, "Some Simple Economics of the Blockchain", (2017), Rotman School of Management Working Paper No. 2874598, MIT Sloan Research Paper No. 5191-16, 12.

4406 J. Abadi & M. Brunnermeier, "Blockchain Economics", (2018) <https://scholar.princeton.edu/sites/default/files/markus/files/blockchain_paper_v2c.pdf>.

cause if such were to attract a considerable number of existing users, in particular at the initial stages of its development, rewards (for mining) may be very high. Hence, contrary to centralised platforms which, due to indirect network effects have the capacity to dissuade competing platforms from entering into the market, by denying them access to an efficient scale (of developers and contributors etc.), or to maintain a competitive advantage over their competitors, in the case that there is entry, thereby leading to a gap between the fee charged by the incumbent and the fee charged by the entrant, these indirect network externalities are much lower for blockchain⁴⁴⁰⁷.

Sixth, the form that competition may take is different for blockchains than for centralised platforms. As indicated above, competition among platforms mostly takes the form of 'competition for the market', as network effects often lead to 'winner takes most' competition, with only one platform controlling, or being the significant player, for a relevant market or, more broadly, a value chain. Thus, markets marked by platform competition are concentrated, sometimes to such an extent that the second or third player in the market may not offer a viable competitive alternative to the established platform with the result that inter-platform competition remains weak and that there is significant inequality in the distribution of market shares among (horizontal) competitors. At the same time, the centralised platform forms a 'bottleneck' with the power to determine the allocation of the surplus generated by the value chain between the various contributors, and, in particular, to keep the overwhelming part of this surplus thereby accumulating significant profits for itself. In view of the (reported) low levels of users switching to competing platforms, platform operators can be confident that the reduction of vertical competition between the different segments of the value chain, with regard to the allocation of the total surplus value generated by the value chain, will not lead to a significant number of applications-developers deserting their platform. Hence, value chains dominated by digital platforms are also marked by a very unequal distribution of profits between the relevant established platform and other participants in the ecosystem. Users are also unable to identify how much value they add to the platform's operations as the history of transactions is not public and this information is only collected and stored by the platform or online intermediary.

In contrast, blockchain enables various forms of competition to intensify. First, due to the reduced significance of direct and indirect network effects, inter-platform competition is more intense. Both users and app developers may switch more easily to competing platforms. If a platform economy is characterised by 'winner-takes-most' competition or 'competition for the market', blockchain reverts the focus to 'competition in the market', as lower entry costs and the reduced significance of network effects have the potential to lead to less concentrated, more contestable markets. Quite significantly, horizontal competition is not only limited between the blockchain and other competing platforms but may also consist in competition from a 'fork' blockchain (i.e. the blockchain with a different set of rules), should the developers and users of a blockchain decide to migrate to the new one because of their dislike of the former system's existing

4407 Ibid, 3.

rules or blockchain governance. In this case, the information in the blockchain will be replicated thereby levelling the playing field between the 'old' and the 'fork' blockchain. At the same time, through their private key, users maintain information about their contribution to the value of the blockchain. The fact that this information is not controlled by a centralised ledger makes it possible to devise ways to compensate users for the value they add. Thus, vertical competition is more intensive and the surplus generated by the value chain more fairly distributed among the various contributors.

Despite the various advantages of blockchain in comparison to centralised platforms and the dominant decentralisation narrative, the choice of a decentralised distributed ledger does not dispense of any risk of intermediation and centralization.

There are different types of intermediaries⁴⁴⁰⁸.

Oracles serve as links between the blockchain and external 'off blockchain' events that may trigger the enforcement of smart contracts when these external conditions reach the level specified in the contract. *Oracles* bring data from an outside source onto the blockchain. There is a number of companies specialising in connecting web applications programming interfaces ('APIs), which allow software to interact with another piece of software), or any other data sources, thus, enabling the implementation of smart contracts and the interaction of the blockchain with the context external to it. In view of the relative failure of a decentralised and distributed Oracles network, such as Orisi for cryptocurrency contracts in which a large number of players operated as blockchain oracles reporting data from the outside⁴⁴⁰⁹, more centralized oracles solutions were developed, either by trusting the companies controlling the data sources or by involving third parties that developed authentication and verification procedures for external data sources – a distributed but not a decentralized oracle system). Oracles may even be algorithmic entities operating on the basis of sensors or other trusted data-feeds generated by devices (in the IoT environment), Big Data harvested from the Internet, or other trusted web application programming interfaces ('APIs'), thus, establishing a reliable connection between these APIs and the DApps. Therefore, their main function is to connect the blockchain to the real world. They may also serve as reliable sources of information about the external world when engaged in online dispute resolution systems⁴⁴¹⁰.

Curators perform a variety of technical functions, such as contributing to the selection of proposals coming from the contractors and/or preventing 51% attacks that could undermine the integrity of the blockchain⁴⁴¹¹. This form of architecture was selected for the decentralised autonomous organisation ('DAO') launched in 2016, with twelve curators, most of them respected and trusted Ethereum programmers, who were able to

4408 Ibid.

4409 See GitHub, Orisi White Paper (2014) <<https://github.com/orisi/wiki/wiki/Orisi-White-Paper>>.

4410 For instance, Jurico is a decentralized blockchain-based dispute resolution platform designed to help resolve smart contract-related disputes by allowing users to open disputes and then oracles to vote on whom won the dispute with the most votes making the decision, see Oliver Dale, "JUR ICO: Decentralised Dispute Resolution Platform", (Blockonomi.com, 11 July 2018) <<https://blockonomi.com/jur-ico/>>.,

4411 Ibid.

whitelist proposals (i.e. add contractor addresses to the DAO whitelist), by checking the identity of people submitting them (making sure that the code of the proposal actually originates from the contractor, thus, confirming that the proposal comes from an identified entity or person). These curators were also able to freeze the DAO activities in case of attack⁴⁴¹². The nature of this intermediary role involves curators being appointed by the token holders (most likely in the form of a 'multisig' contract) but potentially being fired by them at will. This control structure avoids the risk of centralisation.

For its operation, blockchain also requires the presence of a number of intermediaries, whose function is to either keep the blockchain operational, in principle by validating the transactions/blocs, or to enable transactions between different blockchains, thus, ensuring that the native tokens of one blockchain may be exchanged with those of another.

The first operation is performed by *miners*. 'Mining', in blockchain terminology, is the procedure that aggregates pending transactions in a block and by making a vast amount of cryptographic calculations ('hash functions') produces a valid outcome that satisfies a list of strict, predefined conditions encoded in software. The block is appended to the head of the blockchain and the procedure starts all over again. The miner is rewarded for the processing power spent to produce the block with either a newly generated coin or by a transaction fee. The Bitcoin architecture is a deflationary policy designed and implemented on a protocol level, with the quantity of bitcoins minted per block being reduced by 50% every 4 years ('halving period'). Initially, the block reward was 50 BTC, then 25 and in July 2016, it was reduced to 12.5. The aim is to ensure that the number of bitcoins in existence will not exceed 21 million and the last satoshis (i.e. the smallest denomination, one hundred millionth of a bitcoin) will have been mined by the year 2140.

During the first years of the network, a simple desktop computer could be used to mine bitcoins, which is compatible with Satoshi's vision of 'one CPU, one vote'. However, as it became more popular and its price appreciated, the attention bitcoins received led to the development of more efficient hashing hardware, thereby excluding from the market normal miners who were previously mining Bitcoin using their consumer grade hardware, such as computer processing units ('CPUs') and graphic processing units ('GPUs'). GPUs, and then field programmable gate array ('FPGA') devices, were used by sophisticated users for mining. Nowadays this can only be done by powerful specialized hardware that performs several billions of hash operations per second: application specific integrated circuits ('ASICs'). These ASIC devices, with chips developed for the purpose of mining specific algorithm, were developed by a small number of top Chinese companies. This has made bitcoin mining unprofitable for individuals and has led to the creation of big mining facilities, the so-called *mining farms*. Usually, these farms are built in places that provide cheap electricity, preferably combined with a cold environment for facilitating the dissipation of the excessive heat produced by the mining equipment. Most of them are located in China (60% of the total hashpower) due to the cheap coal-

4412 See S. Tual, "On DAO Contractors and Curators", (blog.slock.it, 9 April 2016) <<https://blog.slock.it/on-contractors-and-curators-2fb9238b2553>>.

based electricity as well as the abundance of hydro-electric facilities, while most of other locations are based on far north countries such as Canada, Sweden and Iceland. These facilities earn important revenues but they need to sell a big portion of the bitcoins produced in order to pay the bills and re-invest in hardware equipment since this becomes obsolete rather quickly. Mining pools enable the aggregation of various miners that want to invest in mining equipment but do not have a high enough hash-rate. The miners involved form big groups. They combine their computational power and share the resulting profits between them according to each individual's contribution. At the moment, there are many pools with different economic models but most of them take a portion of the profits as a fee. Other cryptocurrencies, such as Bitcoin Gold ('BTG') have adopted ASIC resistant algorithms to avoid the problem of mining centralization by big players and to instill trust in normal miners that they can use their average hardware for mining. This has led to a huge demand in GPUs. The stock of big manufacturers, like NVIDIA, have been emptied whilst the prices of GPUs have rapidly increased. This may, in itself, lead to some degree of centralization as fewer miners will be able to afford them and reach the minimum efficient scale.

Digital wallets and digital exchanges enable the exchange of native tokens of different blockchains, which, in turn, enables the development of blockchain-based digital marketplaces.

Digital wallets can be both software and hardware. The *hardware* wallets provide strong, banking-grade security. The keys that manage the funds are generated by the hardware whilst the transactions are signed internally and then broadcasted. Hence, there is no online exposure of the keys. This provides a lot more safety and reduces the potential for hacking as no connection to the Internet is required. There are three main hardware wallet providers: Ledger, which provides wallets for the average user ('Ledger Nano S/Blue') as well as security solutions ('Ledger Vault') for customers that demand higher guarantees, e.g. banks and hedge funds, Trezor and KeepKey.

Software wallets, on the contrary, do not require the purchase of any specialized device. They can run on a smartphone or desktop. They are less secure than the hardware ones because the attack vector is larger mostly because these devices require access to the internet and in order to be fully secure the underlying software platform needs to be secure, which is never the case e.g. a vulnerability in the Android OS can give full access to the wallet app and a potential hacker can steal the relevant funds. Most software wallets are open source projects, the development of which was initially dependent on user donations. Consequently, many of the wallets that were very popular in previous years have stopped being used due to halts in development. Since all of them are free to download and install, the common business model and, hence, the main source of revenue is based on fees charged for additional services and support. Recently, driven by the ICO explosion, most of them found another way to profit. They advertise and promote their service and support efforts, usually through the so called 'airdrops' (free token delivery to the wallet users). Some of the most popular wallets are Electrum, Green Address, Coinomi, Bitcoin.info, Jaxx, BitGo and Mycelium. An interesting development in this area

is the idea of a hybrid approach that integrates a fully operational exchange into the wallet. Wallet providers could take advantage of their user base and provide a user-friendly way for their users to buy and trade cryptocurrencies at the same time whilst they, as the providers, receive the fees charged for the services offered. One of the first attempts of this is Eidoo, a multicurrency wallet that aims to provide the service of a decentralized exchange. It is of great interest to note here that companies from the traditional fintech world are starting to consider this route as well. Revolut, a digital banking solution offering peer-to-peer payment options, pre-paid cards and multi-currency accounts and exchange, a few months ago announced the launch of a crypto-exchange offering their users the possibility of buying, storing and trading certain cryptocurrencies.

Blockchain intermediaries and other suppliers of resources may also constitute another possible centralisation lever to the extent that they can use their control over key inputs to shape competition on the marketplace in their favour. This, for instance, may be the case of an oracle that controls access to essential external data sources for the operation of specific smart contracts, exchanges or digital wallets that have become indispensable, for instance because of network effects, or because they gain critical mass by leveraging their dominant position from another network, external to the blockchain. An example would be a blockchain teaming up, on an exclusive basis, with a digital platform whose consolidation of a digital sector has resulted in it controlling some indispensable asset, such as storage on the cloud⁴⁴¹³. Blockchain entities may adopt strategies linking blockchain with complementary spheres or markets where the firm maintains some absolute strategic advantage. These will most often be markets with significant network effects, thus 'off-blockchain', but one may also envisage the possibility that an economic entity acquires such a preeminent position in the blockchain space.

One may also envisage the possibility that a dominant blockchain standard emerges that takes hold of blockchain applications, the same way operating systems and the need for standardization and interoperability led to the development of centralized structures in the pre-blockchain period. For instance, one may envisage the possibility that Ethereum, known for its smart contract technology, could develop to the dominant platform for decentralized applications ('DApp') and smart contracts in the blockchain space. It is very hard and irresponsible to make predictions in a nascent space like blockchain but since its launch, Ethereum has seen rapid development and mass adoption. The reasons behind that are that Ethereum benefitted from a first-mover advantage, as it was the first DApp and smart contract platform to enter the market, the flexibility and simplicity offered by the Solidity programming language in DApps are written on the Ethereum platform and the network effects that followed because most smart contract applications are written for the Ethereum platform (more than 250000 developers using the

4413 See A. Bartels, D. Bartoletti, J. Rymer, M. Guarini & R. Valdovinos, "The Coming Consolidation of Cloud", (2017) Forrester Report, noting that the three areas of greatest consolidation are currently in the base-level computing and storage known as infrastructure as a service ('IaaS'), desktop applications delivered via the cloud and customer relationship management. The report notes that the three largest providers in those markets already collectively hold 70 per cent or more of subscription revenues, with little chance that their market share declines. Amazon Web Services ('AWS') dominates the public cloud market, followed by Microsoft Azure and Google Cloud Platform.

Ethereum platform). The fact that Ethereum enables the implementation of blockchain technology in the wider economy, captured the attention of big corporations, banks and consulting firms (such as Intel, JP Morgan and Deloitte), which invested in the technology. Furthermore, Ethereum is supported by a non-profit organization, the *Enterprise Ethereum Alliance*, connecting “Fortune 500 enterprises, start-ups, academics and technology vendors” with the community of Ethereum subject matter experts, which forms a big network of collaboration and innovation promotion⁴⁴¹⁴. The openness and flexibility of Ethereum led to a number of DApp and smart contract applications being launched on the basis of this platform, which following the ICO explosion of the last three years has led to the emergence of the Ethereum ecosystem with a market capitalization worth around US\$45 billion in the second quarter of 2018⁴⁴¹⁵.

Although the crowdsourcing model for the funding of blockchain applications may preserve us from the problem of the same group of venture capitalists and institutional investors controlling or influencing it, one may not exclude the possibility that a core team of developers controls or influences competing blockchain applications. The small community of blockchain experts, some of whom have thousands of followers and exercise an undeniable influence over the actors’ perceptions of the evolution of the industry, provide some stakeholders with the power to frame the ongoing conversation/agenda about the future of the blockchain. Due to the important weight of its futurity dimension, this power may be easily converted to economic rents.

Blockchain technology has some inherent limitations that may interfere with the process of transforming the competitive advantage to dominance and higher profitability.

First, blockchain largely consists in combining code that is open source and could be easily replicated by competitors with purpose-built hardware, which is also available, sometimes at a relatively low cost, to competitors. Furthermore, blockchain technology does not enable the development of mechanisms isolating the incumbent from actual or potential competition. The possibility of developing a blockchain fork, in the case that some blockchain actors disagree with the blockchain developers, diminishes any likelihood that direct and indirect network effects will set high barriers to entry.

In order to transform the competitive advantage provided by capabilities acquired in blockchain technology to sustainable strategic advantage, economic actors should adopt conduct in complementary spheres or markets that will be strategically linked with the blockchain technology with the objectives of protecting the advantage provided by these blockchain capabilities and of limiting the possibility of their rivals to copy them. Thus, in order to protect their profits, economic actors will have to develop isolating mechanisms.

Acquiring a first mover advantage is certainly a successful strategy but for it to be maintained and eventually expanded on the firm should make considerable investments on

4414 See Enterprise Ethereum Alliance, “Introduction and Overview”, (entethalliance.org, 2017) <<https://entethalliance.org/wp-content/themes/ethereum/img/intro-eea.pdf>>.

4415 See Statista, “Market Capitalization of Ethereum from the 3rd Quarter 2015 to 2nd Quarter 2018” (statista.com) <<https://www.statista.com/statistics/807195/ethereum-market-capitalization-quarterly/>>.

innovation. It also makes sense for the firm to focus on difficult problems that no one else has previously explored, seeking technical solutions that could potentially be implemented in the whole industry.

Another mechanism to protect the competitive advantage in the long-term is technical complexity. By combining cryptographic techniques, unique computational power, cheap and extensive storage capabilities and powerful algorithms, firms can make it more difficult for their competitors to reproduce the firm's original competitive advantage. Attracting highly specialised staff (blockchain core developers), who have been specifically trained in this complex combination of assets, may also have significant effects on competition, in view of the relative scarcity of 'blockchain experts', at least at the initial stages of the development of this technology⁴⁴¹⁶.

This may be combined with a strategy of patenting blockchain technologies, developing an IP portfolio protecting investments in these technologies, and/or proceeding with a simple protection as a trade secret. The last option may not be that attractive as currently blockchain applications are open source (i.e. the source code is accessible and editable by everyone). This is essential in order to attract the user community. Although the original blockchain codes used for Bitcoin and Ethereum (smart contracts) are open source, patent applications may be made for algorithms improving the blockchain processing operations and/or for algorithms or hardware enabling new uses of blockchain⁴⁴¹⁷.

4.3.4.1.6. Future bottlenecks?: Quantum computing, private payment and monetary systems

The promise of cryptographic blockchain-generated and decentralised digital economy may not materialise if the development of technological innovations, such as quantum computing make blockchain-based systems vulnerable. Because of the superior ability of quantum mechanics to perform calculations in comparison to regular computers, they are not only able to perform certain tasks much faster, but also enable an exponential growth of computing power through 'entanglement', enabled by the state of superposition, as quantum computers rely on quantum bits (or qubits), which can be both a 0 and 1, contrary to regular computers which use binary units called bits, representing one of two possible states: 0 or 1. The development of quantum computing challenges the idea of blockchains' immutability, enabling a potential forger to perform reverse calculations faster than miners, thus taking control of the blockchain and its transaction history⁴⁴¹⁸. A possible way out of this conundrum is to make the blockchain a quantum-

4416 See M. Zduniak, "6 Ways to Stay Ahead of Blockchain Competition" (espeoblockchain.com, 23 May 2018) <<https://espeoblockchain.com/blog/blockchain-competition-example/>>.

4417 See the detailed discussion in I. Lianos, Blockchain Competition – Gaining Competitive Advantage in the Digital Economy: Competition Law Implications, in P. Hacker, I. Lianos, G. Dimitropoulos & S. Eich (eds.), *Regulating Blockchain – Techno-Social and Legal Challenges* (OUP, 2019), 329.

4418 See, the discussion in A. K. Fedorov, E. O. Kiktenko & A. I. Lvovsky, Quantum computers put blockchain security at risk, *Nature* (November 19th, 2018), available at <https://www.nature.com/articles/d41586-018-07449-z>.

based system itself⁴⁴¹⁹. The above is still a an hypothetical discussion, as we are three to five away from quantum-computing being applied in the real world and to perform operations better than a normal computer⁴⁴²⁰. However, there is a distinct possibility that the development of quantum computing platforms may constitute a further central point of control in the future, in particular as a number of Big Tech actors, such as Google, Microsoft and IBM, are investing in the field⁴⁴²¹. The market is also characterised by a number of active quantum computing start-ups, such as D-Wave Systems (funded in 1999) which has raised more than \$200 million of funding by December 2018, or Rigetti Computing (funded in 2013)⁴⁴²². The global quantum computing market revenue is projected to amount to \$2.2. billion by 2025, from a mere \$167 million in 2019⁴⁴²³, with some projecting even a market size of \$15 billion by 2028⁴⁴²⁴. Worldwide quantum computing patent applications are on the rise⁴⁴²⁵, with D-wave systems holding the largest number of patent families (grants/applications) worldwide, followed by IBM and Microsoft, although the three most recent years (2015-2017) IBM took the lead in the number of new patent families⁴⁴²⁶ US and Chinese Universities and research organisations have the most patent families (grants/applications) in this area⁴⁴²⁷. It is still unclear how network effects, increasing returns to scale and scope and learning effects will play in this area.

Private online and mobile payment systems and/or monetary systems may also emerge as an additional point of control, and therefore bottleneck. Digital payment systems are currently characterised by a tight oligopoly in the US (with a prominent role for Amazon Pay)⁴⁴²⁸ and in China (with a prominent role for Alipay)⁴⁴²⁹. Although the cryptocurrencies market is currently characterised by the dominance of Bitcoin, with a market capitalization of more than \$208 billion, almost tenfold more than the second one Ethereum⁴⁴³⁰, the high volatility has impeded the expansion of the use of cryptocurrencies in day-to-day transactions, the main drive for the development of Bitcoin being speculation. However, the recent announcement by Facebook that it will launch the 'low-volatility' Libra coin, on the basis of 'low-volatility' assets like bank deposits and government securities

in currencies from stable central banks may mark, if this project will move successfully ahead, the emergence of a new model. Big Tech may develop private monetary eco-systems, combining cryptocurrencies with a payment system, on the basis of permissioned blockchain technology that could potentially change into a permissionless network over time, and in cooperation with established payment systems, as Facebook did with Visa and Mastercard as well as a number of corporate financial, telecommunications, and technology service providers, such as Coinbase, Mastercard, Visa, eBay, PayPal, Stripe, Spotify, Uber, Lyft, and Vodafone. This may constitute the next step in digital competition, following the emergence of multi-purpose messaging, social media and mobile payment apps, such as Tencent's WeChat, which already counts more than 1.1 billion monthly active users in 2019⁴⁴³¹. It is again too early to predict how these initiatives will play out and what would be their impact on digital competition and the constitution of new bottlenecks in the digital economy.

4.3.4.2. Strategic competitive advantage

Competitive advantage may result from strategies that aim to impede effective entry from rivals, either by increasing the potential rivals' costs, or by reinforcing the stickiness of consumer demand with the incumbent, thus limiting the possibilities of switching. In the context of the digital economy and platform competition, such strategies take more complex forms than the pure standalone product competitive strategies envisaged by 'simple economics' where firms compete on a relevant product market, the parameters of their competition being mainly the price and the quality of their specific product.

However, the digital economy is characterized by a more complex competitive game. This complexity has first taken the form of the constitution of *product platforms*⁴⁴³², a number of firms offering a package of complementary products and technologies ('systems competition').⁴⁴³³ These different 'families' of related products increase the costs of new entrants, as in order to compete they need to invest in both their core product and complements, in order to offer a competing 'family' of products, or to establish some form of cooperation with firms producing complements. If they do not do so, they may face the competitive risk of exclusionary strategies by the firm offering a family of products (firm A). The latter may choose to make its core product incompatible with others and either subsidize firms that produce the complementary products with a condition of exclusivity, or to subsidize its division that sells complementary goods. As a result of this strategy the value of the firm A's product, as well as imposes hurdles to firm A's rivals. This may create market power, although one must not exclude also possible pro-competitive justifications (e.g. quality certification, double marginalization avoidance if there is market power in complementary products' markets). To the extent that these practices may affect the same consumers, as these buy both the core and the comple

4433 M L Katz & C Shapiro, 'Systems Competition and Network Effects' [1994] 8(2) *Journal of Economic Perspectives* 93.

mentary products, one may relatively easily sort out the effects of such strategies on consumer welfare.

Things get more complicated in the context of *industry platforms* which function at the level of the industry and 'bring together individuals and organizations so they can innovate or interact in ways not otherwise possible with the potential for nonlinear increases in utility and value'⁴⁴³⁴. This is archetypical of a complex economy situation, as the value here increases, or decreases, geometrically every time there is an additional (or one less) user in view of the network effects and the positive (or negative) feedback loops coming from connecting *different* (and not the same as in the previous product platform example) users to each other. Hence, the quality of a specific product, or even that of the 'family' of products is in this configuration less important than the value provided by the platform. What is even more remarkable is that in order to operate a successful platform strategy, it is not even necessary to produce or deliver any product or services, the main activity of the platform consisting in bringing 'together two or more market actors or "sides"'⁴⁴³⁵. Platforms should aim to take advantage of the positive feedback loops by devising strategies that create value for all user sides (the so called 'chicken and egg' problem that successful platforms need to resolve)⁴⁴³⁶.

Platform competition does not therefore only involve creating stand-alone value for a group of users, but value for all sides (two-sides or more) so that they come on board the platform simultaneously. Erik Hovenkamp further emphasizes the 'significant coordination challenge' of platforms: '(they) must maintain an adequate balance of participation levels within the two sides in order for *anyone* to derive value from its service', such balancing being 'a tangled and dynamic process: anything affecting participation on one side (such as the fees charged to its users) will necessarily influence the platform's appeal to users on the other side, which, in turn, affects the latter side's participation as well', which adds 'new layers of complexity to the analysis'⁴⁴³⁷.

As it is clear from the above, one needs to distinguish between a standalone product strategy, which has so far been the focus of competition assessment, and industry platform strategies, which is the prevailing competitive strategy in the digital economy. This is linked to the superior profitability of platforms, which also explains their high valuations by financial markets. In some recent research Cusumano, Gawer and Yoffie found that 'despite comparable revenues to other firms in the same industries' platform companies had typically 'about half the number of employees, much higher operating profits, and much higher market values as well as higher ratios of market value to sales'; they also spent 'significantly more on R&D and other expenses related to sales, mar-

ECON* 309, 310 (note that two-sidedness 'give[s] rise to a chicken & egg problem: to attract buyers, [the platform] should have a large base of registered sellers, but these will be willing to register only if they expect many buyers to show up').

4437 E. Hovenkamp, *Platform Antitrust*, (July 24, 2018). *Journal of Corporation Law*, 2019, Forthcoming. Available at SSRN: <https://ssrn.com/abstract=3219396>, 3.

keting, and administration, but they also grew faster in revenues and market value⁴⁴³⁸. These made them 'more productive (in terms of sales per employee), much more profitable, and much more valuable than conventional public firms in the broader world economy'⁴⁴³⁹. At the same time the same authors that a significant amount of platforms failed, which led them to characterize the current platforms as 'survivors' of a cut-throat process of competition⁴⁴⁴⁰. This indicates that competition between platforms can be virulent.

Cusumano, Gawer and Yoffie note, however, that 'not every industry lends itself to a platform strategy' and explain that 'a platform strategy should prevail over a stand-alone product strategy when (1) there are opportunities to tap this innovation capabilities of outside firms to enhance value; and (2) it is more economical to enable transactions rather than to own assets and deliver products or services directly'⁴⁴⁴¹. This relates to the categorization by these authors of platforms in three 'basic types': *innovation platforms*, *transaction platforms* and 'hybrids'⁴⁴⁴². Innovation platforms 'usually consist of common technological building blocks that the owner and ecosystem partners can share in order to create new complementary products and services, such as smartphone apps or digital content'⁴⁴⁴³. *Transaction platforms* 'are largely intermediaries or online marketplaces that make it possible for people and organizations to share information or to buy, sell, or access a variety of goods and services'⁴⁴⁴⁴.

Although not envisaged by the authors in such a way, one may summarize the platform typology as merely referring to different dimensions of efficiency. First, the establishment of innovation platforms is linked to superior innovation efficiency as the control by a firm of a general purpose technology, or of a technology that cannot be easily duplicated by someone else provides this firm some superior ability to manage the process of adding complementary functionalities to that technology. Second, the creation of transaction platforms is linked to the superior transactional efficiency of an entity as an intermediary to the extent that it connects two different groups of users that were not previously linked. In any case the boundaries of what may constitute a platform and multi-sidedness are not clear, these not being just related to the characteristics of an industry but also being determined by the business strategies of the firms⁴⁴⁴⁵. As Erik Hovenkamp notes 'there is no universally-adopted definition of a two-sided platform,

4445 See, A. Hagiu & J. Wright, *Multi-Sided Platforms*, (2015) 43 (issue C) *International Journal of Industrial Organization* 162- (noting that past literature has treated "multi-sidedness" 'as a given characteristic of the relevant industries and firms' but that '(i)t is important to recognize, however, that many real-world organizations make choices that determine how close or how far they are from a multi-sided economic model, and that these choices carry significant economic trade-offs').

because most bright-line definitions are either under- or over-inclusive⁴⁴⁴⁶. Hybrids are the most successful platforms and combine elements of both transaction and innovation platforms. Cusumano, Gawer and Yoffie distinguish between an 'integrated hybrid' strategy, which connects a transaction and an innovation platform within the same firm, and a 'conglomerate hybrid strategy', which adds another type of platform but without connecting the two 'technically or operationally', thus resembling to a conglomerate⁴⁴⁴⁷.

The 'non-linear growth' of platforms may be explained by the 'winner takes most' competitive game they play. This is largely, but not uniquely, due to network effects. Cusumano, Gawer and Yoffie note that 'three critical issues' may explain the dominance of one platform, or a more fragmented market: '...the importance of different types of network effects; ... the impact on company performance of other factors – multi-homing (use of another platform for the same purpose at the same time) as well as niche competition and supply-side barriers to entry; and ... how digital technologies can influence network effects and other market drivers' through differentiation⁴⁴⁴⁸. This calls for an analysis of the following four drivers for strategic competitive advantage that may lead to a 'winner takes most' outcome.

4.3.4.2.1. The degree of network effects and multi-sidedness

Multi-sidedness is often a matter of degree. This is relevant not only in order to answer the question whether a platform strategy is adequate for a specific industry, but also in order to determine how the 'winner takes most' competitive dynamic will play out. According to Metcalfe's law, the effect of a network is proportional to the square of the number of connected users of the system (n^2)⁴⁴⁴⁹. The size of the network increases the value of the network. An additional user adds more value and therefore creates positive externalities for the members of the network, which he does not internalize. From this one may derive that the value of a network will also be related to the number of links between its nodes. Hence, for a network of n nodes, its utility value is $n(n-1)/2$. In the context of a platform/multi-sided context, the network effects are among two, or more, different group of users (indirect network effects). Indeed, 'each side's demand for the platform's service depends not only on the price it is charged by the platform, but also the number of users participating on the other side'⁴⁴⁵⁰. One may thus distinguish between situations of substantial inter-dependence in the demand between the

4448 Ibid., 31.

4449 This law was attributed to Robert Metcalfe who apparently expressed it in the 1980s. For instance, a phone network with 10 people has a utility value of 100 and a network with 100 people has a utility value of 10,000. For a discussion, see XZ Zhang, JJ Liu, ZW Xu, Tencent and Facebook Data Validate Metcalfe's Law, (2015) 30(2) Journal of Computer Science and Technology 246.

4450 E. Hovenkamp, Platform Antitrust, (July 24, 2018). Journal of Corporation Law, 2019, Forthcoming. Available at SSRN: <https://ssrn.com/abstract=3219396>, 9.

two, or more, groups of users, and situations where this inter-dependence in demand is weaker. In other words network effects may vary.

The existence of strong positive feedback loops may make the platform market to ‘tip’ to a dominant platform⁴⁴⁵¹. One would normally expect a strong ‘winner takes most’ dynamic in situations of substantial inter-dependence in demand, while in the presence of weaker indirect network effects, the ‘winner takes most dynamic’ may not play in the same way. This may be a factor of differentiation that depends on the ‘chicken and egg’ strategies of the various platforms and how successful they are in taking advantage of the indirect network effects in order to increase the utility value of their network, and therefore consequently the size of their network and so forth. As we have explained in Chapter 3, the platforms need to choose the market sides, and then determine which one will be subsidised by the money side, in which way, how much and when, so as to efficiently solve the chicken and egg problem.

4.3.4.2.2. Multi-homing

A second parameter determining the strength of the ‘winner takes most’ dynamic, is the possibility and level of multi-homing, that is the possibility of using multiple platforms at the same time and for the same purpose⁴⁴⁵². This will tend to arise within a given side if ‘(a) users on this side view the alternative platforms as reasonably substitutable; and (b) there are not significant fixed costs required before users can start using a given platform, nor any exclusivity contracts that prohibit users from multi-homing’⁴⁴⁵³. ‘Multi-homing can occur on both sides of the platform, just on one of them, or be impossible’⁴⁴⁵⁴. The fact that users multi-home (on either side) may weaken network effects, with the result that it may ‘inhibit a platform even with strong same-side (direct) network effects from fully monetizing cross-side (indirect) network effects’⁴⁴⁵⁵. Certain technologies may promote multi-homing while others less. For instance, the use of AI and the provision of highly personalised services may limit the incentive of consumers to multi-home. Users tend to single-home in search engines. Multi-homing is not only function of the technology and prevailing consumer habits in the industry, but may also be promoted or reduced through strategic conduct, involving various forms of marketing and branding. For instance, the level of multi-homing in browsers is generally lower in smartphones than in PCs, possibly because of the bundling strategies followed in the former, while it is relatively frequent that more than one browser are downloaded and used on a PC.⁴⁴⁵⁶ Multi-homing in app-stores may also be limited by exclusivity arrange-

ments, while in social media it may be affected by the amount of time people have to spend on social media providing similar functionalities, time being a scarce resource. The following table details the strength of multi-homing for various types of digital platforms.

Table A.2.1.: Multihoming

Platforms	Marketplaces	App-stores	Social networks	Online advertisement
Multi-homing	Medium for buyers; low/medium for sellers	Low for users; medium for developers	High for users and advertisers	High for users and advertisers, medium for publishers

Source: Adapted from N. Durch-Brown, *The Competitive Landscape of Online Platforms*, JRC Digital Economy Working Paper 2017-04 (2017), available at <https://ec.europa.eu/jrc/sites/jrcsh/files/jrc106299.pdf>, 9.

In devising their strategies firms should also take into account the heterogeneity of users preferences with regard to platform multi-homing⁴⁴⁵⁷. A market will tip, in one way or another, if the feedback loops among the various groups of users are strong. The more homogeneous the market is, the stronger the network effects will be, thus attracting the overwhelming majority of users⁴⁴⁵⁸. For instance, the market will tip if users of an app store care strongly about the availability of applications and developers care strongly about access to users. However, a market will be less tippy if for some reason users and developers have stronger and more differentiated tastes for the platform itself⁴⁴⁵⁹. It should also be expected that popular apps will also multi-home, most of the attractive apps being available to users whichever of the leading platforms they choose⁴⁴⁶⁰. The more multi-homing there is at the different sides of the platform, the more this reinforces the dynamics of inter-platform competition or competition between platforms and one-sided competitors on a product market thus making the field of the competitive game more contestable and can thus avoid tipping.

4460 *Ibid.*, 33 (noting the crucial role of inframarginal developer multihoming decisions in this context and of the industrial organization of the supply of apps).

4.3.4.2.3. Differentiation and niche competition

A third parameter crucial for the emergence of a dominant platform is differentiation and niche competition⁴⁴⁶¹. The existence of network effects at the demand side, as well as learning effects and increasing returns to scale and scope at the supply side, make it extremely difficult for a new platform to compete with regard to the core functionality provided by a dominant platform once the market has tipped and the number of users increases slowly. This is in particular the case if a general purpose technology and/or the functionality provided by the platform is more mature, and we are not in a phase of diffusion where the demand is still untapped⁴⁴⁶². This provides a considerable competitive advantage to the dominant platform. The only way a new platform may erode the position of the leading platform is to differentiate itself from it and to focus on a specific market niche, taking advantage of the heterogeneity of the users. The aim would be to attract a sufficient number of users at one side of the platform so as to generate the indirect network effects that would bring users at the other side and will eventually aim to initiate a new market tipping process. It is not necessary though that the market tips for the platform to be successful. Focusing on a niche market may also be highly profitable. One may give the example of Apple's iPhone, which although having between a 12-15% market share of the global handset industry⁴⁴⁶³, accounted for 62 percent of the global mobile handset profit in 2018, in particular because of its policy of product differentiation⁴⁴⁶⁴, the premium segment of the global smartphone market being almost entirely controlled by Apple's iPhone⁴⁴⁶⁵. In addition to product differentiation, platform differentiation may also play an important role in maintaining competitive advantage. This may come with the addition of new functionalities so as there is no niche market for rivals to capture, thus preempting or marginalizing their entry and the potential competitive threat when this is still nascent. This may also be achieved by purchasing a potential rival that could threaten the dominant position of the platform. This may be a less costly strategy, than the possible risk of market tipping if the rival reaches the appropriate scale.

Although most successful digital platforms control a core business activity, from which they derive most of their revenues (see Figure A.2.6.), they have developed a strategy of active investment in other related markets, most frequently using practices leveraging their dominant position in order to provide their offer in the related market a competitive advantage.

4461 M.A. Cusumano, A. Gawer & D. B. Yoffie, *The Business of Platforms* (Harper Collins, 2019), 44.

4462 It is interesting to note here that the frequent tipping taking place at the initial stages of the development of a technology is frequently followed by a stable hierarchy where the top firms tend to be the same. The following graph with regard to the number of users of media digital platforms may provide an illustration: see, <https://www.youtube.com/watch?v=WLRA7qqijM0>.

4463 See, <https://www.counterpointresearch.com/global-smartphone-share/>.

4465 According to recent statistics (May 2019), Apple's iPhone sales represent 96% of the premium segment: <https://www.statista.com/statistics/781736/global-percentage-premium-smartphone/>.

Figure A.2.6. Digital platforms' core business

Companies	Core Consumer Business	Other	Money-making machine
Alphabet	Search	Mobile OS You Tube	Advertising
Amazon	Resale of goods	Cloud Computing	Distribution mark-up
Apple	OEM and app dev. platform	Digital Content	Selling handsets
Facebook	Social Network	Messaging	Advertising

Source: Author's compilation

There may be several explanations for such practices of product or platform differentiation:

- (i) the platforms benefit from learning-by-doing by expanding their size and the scope of their activities, hence integrating new functionalities in the platform or proceeding to conglomerate strategies may promote learning-by-doing and make them more effective competitors and innovators. Learning effects are crucial in most industries, in particular at the early stages of their history.⁴⁴⁶⁶ Indeed, 'learning gives rise to a special kind of intertemporal externality in production'⁴⁴⁶⁷ as it implies dynamic scale economies in production.
- (ii) The platforms try to take advantage of their control of a bottleneck, or some form of positional advantage in the network, in order to extend their market power in adjacent markets. There may be two versions of this story.

The first is the classic leveraging story. It implies that the platforms will enhance their profitability by expanding in related markets. For instance, the platforms expand in other markets as this may attract more users, in particular in the money making side of the platform. For instance, by expanding in various vertical search engines or content platforms, a search engine may be able to harvest more specific data on its users and thus being able to make better predictions on their preferences, which is certainly something that is highly valued by the money side of the search engine platform, advertising. Hence, the platform may charge advertisers more and increase its profits.

4467 P. Dasgupta & J. Stiglitz, Learning-By-Doing, Market Structure and Industrial and Trade Policies, (1988) 40 Oxford Economic Papers 246.

The second story is connected to financialisation. Here, leveraging will not directly aim in increasing profitability through higher prices in the product market of the money side, but to increase the valuation of the platform by financial markets to the extent that control of a strategic bottleneck may induce financial markets to form the belief that the platform will capture most of the surplus generated by the value chain(s) it is participating to in the future. Here, the advantage does not take the form of higher profitability but higher valuation of the platform asset on the basis of futurity thinking.

- (iii) A third possible explanation of these practices of differentiation in niche competition markets relate to maintenance of monopoly strategies. This may be considered as a combination of learning-by-doing and network effects arguments. As direct horizontal competition on the core business of the platform is extremely difficult, if not impossible, once the development of the GPT it controls has matured, because of the considerable barriers it benefits from (in terms of data harvested, installed base which it is difficult to switch, direct and indirect network effects), the platform only faces potential innovation competition by rivals in niche markets (at either side of the platform) or in vertically situated (to its core business) technology and product markets. A way to pre-empt these competitive threats to its position, the platform may decide to expand in these markets before a strong competitor takes hold and develops to a competitive threat to its core business. This differentiation may not be profitable, in the short-term, but makes sense if ones takes this as a risk management exercise from the platform's perspective. Some authors provide the example of Facebook's reaction to the development of Snapchat from a niche market actor to a potential competitor by cloning a popular feature of Snapchat (Snapchat stories) and implementing it to Facebook (Facebook Stories) and across its other social apps, Instagram and WhatsApp⁴⁴⁶⁸, which for some commentators it led to the slow 'gutting' of Snapchat with the latter's user base shrinking in 2018⁴⁴⁶⁹.

4.3.4.2.4. Barriers to entry

The fourth parameter contributing to the 'winner takes most' dynamic is the existence of barriers to entry in either side of the platform. Indeed, the presence of high barriers to entry leads to more industry concentration and raises the possibilities of tipping towards one or a small number of firms.

In the context of multi-sided platforms these may relate to network effects in the various sides of the demand, such as the number of users (customers), or the high number of apps, that provide the platform strong network effects. With regard to the latter, it has been alleged that the number and quality of apps has played a quite important role in the demise of Research in Motion's Blackberry, Nokia's Symbian and the failure of Microsoft's Windows' phone to compete effectively with Apple's iPhone and iOS and

4468 See, <https://www.businessinsider.com/facebook-stories-now-has-more-than-twice-as-many-users-as-snapchat-2019-4>

4469 See, <https://theweek.com/articles/822419/facebook-slowly-gutting-snapchat>.

Google's Android ecosystem in the OS for smartphone business. Bolstered by network effects, Apple and Google benefitted from a great number of popular apps. Cusumano, Gawer and Yoffie note that although in absolute numbers the number of Windows Phone apps grew considerably after its launch in 2010, with over 320000 apps by the end of 2014, this number could not compare with the 1.2 million apps of Android and 1.2 millions apps of iOS, in particular also because of the unavailability of popular apps, such as Instagram, in the Windows Phone, even after two years it had been available for iPhones and six months for Android phones⁴⁴⁷⁰.

Barriers to entry can also be found on the supply side. This will depend on the fixed costs for launching a platform business or a digital competitor in the specific industry. We have now a number of digital platforms that have been active for a relatively long period of time, some of them a few decades. This enables us to observe the evolution of costs through time, for different types of platforms, young and more mature (see Table 4.X.).

Table A.2.2. Young and Mature Digital Platforms or Re-sellers

Company	Founded	IPO	Latest report	Lifespan (in years)
Netflix	1997	2002	2018	21
Apple	1976	1980	2018	42
Amazon	1994	1997	2018	24
Google	1998	2004	2018	20
Facebook	2004	2012	2018	14

Source: Author's compilation

As for all sectors of the intangible economy, and contrary to tangible economy outside of the technology and information sector, variable costs are generally low⁴⁴⁷¹. However, they are not insignificant for all types of digital platforms. For instance, fixed costs as a proportion of total costs go from 69.75% for Facebook and 44% for Google to 15.89% for Apple, 29.75% for Netflix, and 30,52% for Amazon, the rest being variable costs. Hence, Apple, Netflix and Amazon are closer to the textbook paradigm of a company in the tangible economy, where variable costs are significant, than the textbook paradigm of the intangible economy, which is characterized by high fixed costs and low or almost zero variable costs, while platforms following the advertised-based model, such as Facebook and Google are closer to the textbook paradigm for the intangible economy.

The importance of fixed costs in the digital economy may also raise questions as to the ease of entry (see Table A.2.3.).

4470 M.A. Cusumano, A. Gawer & D. B. Yoffie, *The Business of Platforms* (Harper Collins, 2019), 134-135.

4471 See, H. R. Varian, *Economics of Information Technology* (July 2001), 5, available at <http://people.ischool.berkeley.edu/~hal/Papers/mattioli/mattioli.pdf> (noting that '(c)onstant fixed costs and zero marginal costs are common assumptions for textbook analysis, but are rarely observed for physical products since there are capacity constraints in nearly every production process. But for information goods, this sort of cost structure is very common—indeed it is the baseline case. This is true not just for pure information goods, but even for physical goods like chips. A chip fabrication plant can cost several billion dollars to construct and outfit; but producing an incremental chip only costs a few dollars. It is rare to find cost structures this extreme outside of technology and information industries').

Table A.2.3. Most important fixed costs for certain digital platforms

Digital Platform	Fixed Cost(s)
Netflix	Media content
Apple	R&D, retail space, data centres/servers
Amazon	Media content, warehouses and other logistical expenses, data centres/servers
Google/Alphabet	Headcount, data centres/servers, R&D
Facebook	Headcount, data centres/servers, cybersecurity, R&D

Source: Author's compilation

With fixed costs of \$21.57 billion in 2018 (from which \$10.2 billion go to R&D, \$7.8 billion to marketing and sales and \$3.4. billion to general and administrative costs) for Facebook it is difficult to see which other social media platform would be able to challenge its position and enter the market. Similarly, with \$45.8 billion of fixed cost (from which \$21.4 billion are spent on R&D, \$16.3. billion for marketing and sales and \$8.1. billion for general and administrative expenses) Google has erected a significant barrier to entry for any potential entrant.

The types of fixed costs for the various digital platforms vary and of course depend on the platform's integrative or conglomerate strategies. Box A.2.1. provides more details on some specific examples of platforms' fixed costs.

Box A.2.1. A panorama on Digital Platforms' fixed costs

Netflix

Potential fixed costs: media content.

Some commentators emphasize Netflix's low marginal costs and substantial fixed costs spent on content.⁴⁴⁷² Bandwidth can be considered as variable costs.⁴⁴⁷³

According to Netflix's 2018 Annual Report content commitments are of fixed cost nature and have multiple-year duration.⁴⁴⁷⁴ More specifically, it is mentioned that 'In connection with licensing streaming content, we typically enter into multi-year commitments with studios and other content providers. We also enter into multi-year commitments for content that we produce, either directly or through third parties, including elements associated with these productions such as non-cancelable commitments under talent

⁴⁴⁷² See for example Ben Le Fort, 'The Brilliance of Netflix's Business Model' (Medium, 14 March) <<https://medium.com/impact-economics/the-brilliance-of-netflixs-business-model-ab432a27dd96>> .

⁴⁴⁷³ Trefis Team, 'Why There Won't Be A Notable Improvement In Netflix's Domestic Contribution Margin In The Future' (Nasdaq, 26 October 2016) <<https://www.nasdaq.com/article/why-there-wont-be-a-notable-improvement-in-netflixs-domestic-contribution-margin-in-the-future-cm698980>> .

⁴⁴⁷⁴ Netflix Annual Report 2018, p. 4.

agreements. The payment terms of these agreements are not tied to member usage or the size of our membership base ("fixed cost") but may be determined by costs of production or tied to such factors as titles licensed and/or theatrical exhibition receipts. Such commitments, to the extent estimable under accounting standards, are included in the Contractual Obligations section of Part II, Item 7, "Management's Discussion and Analysis of Financial Condition and Results of Operations"⁴⁴⁷⁵.

Netflix's cost structure makes a good example of a business dependent on fixed costs: 'The video streamer pulled in \$5.5 billion in revenue last year, \$3.7 billion of which went to the line item "cost of revenues," which management says is mostly content expenses, or what it pays to license the movies and TV shows its customers watch. Those are a form of fixed costs. Not surprisingly, the majority of Netflix revenue goes to content licensing and development, and the fixed nature of that cost explains why its earnings are so erratic from quarter to quarter and year to year. It also shows why Netflix highlights its subscriber figures in each report. Additional subscribers are highly profitable for Netflix, as its costs almost nothing to expand distribution to a new viewer. Subscription businesses tend to be built on fixed costs, as the cost to produce whatever content is being sold is the same whether there are one hundred subscribers or one million of them'⁴⁴⁷⁶.

Content amortization is included in "Cost of revenues" based on historical and estimated viewing patterns.⁴⁴⁷⁷ Hence, it is difficult to estimate fixed costs through marketing, technology and development, general and administrative expenses alone. Perhaps, other accounting entries such as streaming content obligations can be useful. Thus, 'Streaming content obligations' grew between 2014 and 2018 from \$9,451,112 thousands to \$19,285,875 thousands respectively (increase of 104%). It is difficult to compare these figures with earlier periods because Netflix seems to have changed its business model from renting out DVDs to producing its own content or acquiring content from third-parties. This shifts Netflix business model closer to being more fixed-costs oriented and its fixed costs should will continue to grow as they need to expand its content.

Apple

Potential fixed costs: research and development, retail space, technical infrastructure (data centers / servers).

Regarding the iPhone's production fixed costs, some commentators point out to 'anything from advertising costs to iPhone research/testing costs'⁴⁴⁷⁸ and 'research and development'⁴⁴⁷⁹.

4475 Ibid, p. 3-4.

4477 Netflix Annual Report 2018, p. 29.

4478 Yoni Heisler, 'Apple and the myth of "The Law of Large Numbers"' (Network World, 19 April 2012), <https://www.network-world.com/article/2222188/apple-and-the-myth-of--the-law-of-large-numbers-.html>.

4479 Chuck Jones, 'How Important Is Apple's iPhone Market Share?' Forbes (29 May 2017) <<https://www.forbes.com/sites/>

As for the retail stores, Apple Annual Reports dated by 2010 and 2002 emphasize fixed costs in retail space: 'The Company's retail stores have required substantial fixed investment in equipment and leasehold improvements, information systems, inventory and personnel. The Company also has entered into substantial operating lease commitments for retail space, with terms ranging from five to 20 years, the majority of which are for ten years'⁴⁴⁸⁰. 'Expansion of the Retail segment has required and will continue to require a substantial investment in fixed assets and related infrastructure, operating lease commitments, personnel, and other operating expenses'⁴⁴⁸¹. As of 2018, Company makes capital expenditures in 'product tooling and manufacturing process equipment; data centers; corporate facilities and infrastructure, including information systems hardware, software and enhancements; and retail store facilities'⁴⁴⁸².

At the same time it is not clear how retail space expansion is relevant in the recent period since annual reports dated 2002 and 2010 emphasized such fixed costs at the time when Apple was creating its stores, but these stores have already been built and there is no comparable expansion taking place right now. On the other hand, Apple does claim in its 2018 Annual Report that 'the Company's retail stores have required and will continue to require a substantial investment and commitment of resources'⁴⁴⁸³.

It is possible that Apple's entrance into services and cloud business can increase fixed costs (data centers, etc.).

Amazon

Potential fixed costs: media content, warehouses / other logistical expenses, technical infrastructure (data centers / servers).

Amazon 2018 Annual Report explicitly states what its variable and fixed costs are: 'We seek to reduce our variable costs per unit and work to leverage our fixed costs. Our variable costs include product and content costs, payment processing and related transaction costs, picking, packaging, and preparing orders for shipment, transportation, customer service support, costs necessary to run AWS, and a portion of our marketing costs. Our fixed costs include the costs necessary to build and run our technology infrastructure; to build, enhance, and add features to our online stores, web services, electronic devices, and digital offerings; and to build and optimize our fulfillment centers and other facilities. Variable costs generally change directly with sales volume, while fixed costs generally are dependent on the timing of capacity needs, geographic expansion, category expansion, and other factors. To decrease our variable costs on a per unit basis and enable us to lower prices for customers, we seek to increase our direct sourcing, increase discounts from suppliers, and reduce defects in our processes. To minimize growth in

fixed costs, we seek to improve process efficiencies and maintain a lean culture⁴⁴⁸⁴.

Some commentators call Amazon 'a classic fixed cost business model'⁴⁴⁸⁵ and take the view that it replaces its variable costs with fixed one judging by its growing CAPEX and Gross Margin⁴⁴⁸⁶. The increase of Amazon's gross margin is the evidence that lowering cost strategy works.⁴⁴⁸⁷ Judging by a steady increase of gross profit margins from 1998 to 2018 Amazon tries to decrease its variable costs and invests heavily in increasing its fixed costs. It seems logical as Amazon shifts from simply being an intermediary between buyers and sellers to being a producer of content and provider of services (cloud, etc.).

Amazon continues to investment funds into fixed cost expansion. During 1st quarter 2019 Earnings Conference Call Amazon's CFO, Brian T. Olsavsky, drew attention 'to the investments that we made in 2016 and 2017. So we did front-load a lot of the investment both in fulfillment centers and also infrastructure'⁴⁴⁸⁸.

It is possible that Amazon's participation in cloud-computing business (Amazon Web Services) will force the company to increase its fixed costs.

Additionally, as Amazon participates in content-creation business, its fixed costs will also grow. For example, 'Amazon Prime has several fixed costs and several variable costs that go along with it. Fixed costs mostly include its cost of content for Prime Instant Video. Variable costs include things like shipping and music streaming. Unlike Costco, Amazon isn't able to send Prime membership fees straight to its bottom line. But it stands to reason that heavy Amazon users would be among the first to sign up for Prime. As Amazon goes after its next 50 million Prime members, they're likely looking for other benefits, such as video streaming, with the two-day shipping acting as an extra bonus. In other words, new members likely cost Amazon less in variable fees than older members, so Amazon is able to keep a larger chunk of that \$99 membership fee'⁴⁴⁸⁹.

Google

Potential fixed costs: headcount, technical infrastructure (data centers / servers), research and development.

According to the Alphabet Q1 2019 Earnings Call 'accrued Capex for the quarter was

4488 Amazon.com Inc (AMZN) Q1 2019 Earnings Call Transcript, <https://www.fool.com/earnings/call-transcripts/2019/04/25/amazoncom-inc-amzn-q1-2019-earnings-call-transcrip.aspx>.

4489 Adam Levy, 'How Prime Makes Amazon Profitable' (The Motley Fool, 29 June 2018), <<https://www.fool.com/investing/general/2016/03/25/how-prime-makes-amazon-profitable.aspx>> .

\$4.5 billion, reflecting investments in data centers, servers and office facilities'⁴⁴⁹⁰. Discussing company's profitability Ruth Porat, CFO Alphabet and Google, said the following: 'with regard to Google Opex, the first quarter results once again reflect our ongoing commitment to investing for the long-term. You can see that in R&D, where we continue to invest in technical talent for priority areas like Cloud, Search and Machine Learning. In terms of Sales and Marketing, the pace of investment in Q1 reflected a timing shift in spend, and we expect these expenses to pick up in the second quarter. In Other Bets Opex, we are still early in the life of these companies and do plan to continue to invest meaningfully for the long-term opportunity'⁴⁴⁹¹ and 'we continue to expect a sizable investment in both compute requirements to support long term growth, as well as in office facilities'⁴⁴⁹².

Additionally, Ruth Porat elaborated on spending (growth in headcount) and CAPEX (technical infrastructure).⁴⁴⁹³

Google's fixed costs that resulted from infrastructure are considered to be its competitive advantage: 'Google has a number of advantages, perhaps foremost being the massive investments in its built infrastructure. Google's mission of "organizing the world's information" requires more than the most sophisticated "big data" software. It also necessitates huge investments in physical plant, particularly data centers, power systems, cooling technologies, and high-speed fiber optic networks. Google has built up a significant global infrastructure of data centers (increasingly located close to cheap, green tech) and connecting its storage systems, servers, and routers is a network of fiber optic switches. For example, the Eemshaven data center facility in the Groningen region of the Netherlands is at the end connection point for a transatlantic fiber optic cable. The US\$ 770 million data center is also being built near a power plant and contracts for other green energy providing an estimated 120 megawatts of cheap electricity. For the most part, the details on fixed costs are not readily available as they are proprietary and represent trade secrets'⁴⁴⁹⁴.

Facebook

Potential fixed costs: headcount, technical infrastructure (data centers / servers), cybersecurity, new technology research and development.

Some commentators in 2012 noted that 'infrastructure is Facebook's biggest cost, and to support growing traffic and network complexity, it will have to spend even more'⁴⁴⁹⁵

4490 Alphabet Q1 2019 Earnings Call, p. 3, https://abc.xyz/investor/static/pdf/2019_Q1_Earnings_Transcript.pdf?cache=ebdc584.

and 'the company is investing heavily on data centres, networks, and servers to expand its reach throughout the world'⁴⁴⁹⁶.

Facebook claims that cyber-attacks and other data-security issues can adversely affect its business.⁴⁴⁹⁷ Hence, we can assume that costs related to maintaining the cyber-security represent a significant amount of company's fixed costs as in the short-run such costs do not vary with the number of users. Additionally, Facebook emphasizes that the amount of technical infrastructure (including network capacity and computing power) has to be increased since the amount of information shared on Facebook grows.⁴⁴⁹⁸ Its own data centers are an example of infrastructure Facebook is investing in.⁴⁴⁹⁹ Facebook also identifies sources of expense growth: expanding data center capacity, network infrastructure, office facilities, investments in safety and security, marketing, and video content.⁴⁵⁰⁰ Expenses on technical infrastructure (data centers) can also be considered as fixed costs, but Facebook includes it into 'cost of revenue' entry on the income statement, making it difficult to estimate as a stand-alone fixed costs.⁴⁵⁰¹

Additionally, Facebook engaged in long-term technology initiatives (connectivity, AI, AR and VR).⁴⁵⁰² Expenses on such initiatives can be classified as fixed costs.

In the latest earnings call Mark Zuckerberg elaborated on the plans to develop 'digital living spaces' focused on privacy.⁴⁵⁰³

Facebook's CFO, David Wehner, elaborated that CAPEX is spent mainly on data centers, servers, office facilities, and network infrastructure.⁴⁵⁰⁴ CAPEX is expected to be driven by investments in data centers and servers in the near future.⁴⁵⁰⁵ Additionally, it was stressed that long-term outlook is to 'invest in core product, infrastructure, innovation, and safety & security'⁴⁵⁰⁶. As for the general outlook on expense growth company's CFO said the following: 'we're not providing specific guidance but I'd note that we continue to invest aggressively across the business and there's no change in our long-term outlook on the need to invest heavily in areas like safety and security, innovation in our core product and infrastructure and the ultimate impact that those will have on our operating margin. We're still positioned to invest aggressively both in 2019 and beyond'.⁴⁵⁰⁷

A platform acts to create barriers to entry, in particular with the development of a two-sided market of complementary goods, the choice of an open or close interfaces and Application Programming Interfaces' (APIs) policy is crucial⁴⁵⁰⁹. As Mulligan notes, 'open interfaces between sub-systems of a platform acts to re-enforce barriers to entry, while open APIs act to develop the market for complementary goods and services'⁴⁵¹⁰. Open APIs may allow for 'divided technology leadership' when a number of different firms supply platform technologies, without any of these firms having the ability to block the widespread distribution of platform improvements⁴⁵¹¹.

4.3.4.3. Financial sources of competitive advantage

In view of the important fixed costs for the launching of a digital competitor, the possibility to tap from dedicated financial resources for tech companies is crucial. It was Joseph Schumpeter who first articulated this important relationship between the entrepreneur – who Schumpeter viewed as the driver of economic growth – and financial markets.⁴⁵¹² However, the nature of startup enterprise imposes challenges in accessing finance, especially in the technology sector.⁴⁵¹³

With negligible performance history, startups may struggle to gain sufficient financial resources.⁴⁵¹⁴ Reflecting inherent issues of moral hazard and adverse selection,⁴⁵¹⁵ market entry may therefore be inhibited by high financial barriers to entry. Likewise, financial barriers are especially acute in sectors characterised by high sunk costs and lengthy periods between R&D and commercialisation, such as the technology sector. The innovative focus of the tech sector compounds this, with access to finance further constrained by the inherent uncertainty of the innovation process and the high cost and effort of monitoring R&D activities.⁴⁵¹⁶

The importance of financial barriers to entry is exacerbated by the rising capital-intensity of tech startups. Traditionally, innovation in the tech sector has been relatively capital efficient, with Microsoft and other early innovators reaching IPO stage with less than \$20 million raised privately.⁴⁵¹⁷ However, innovation in this space is becoming costlier as startups seek to disrupt industries dominated by powerful incumbents.⁴⁵¹⁸ Larger sums of funding is required for potential competitors to reach ‘escape velocity’.⁴⁵¹⁹

In light of the need for financial capital, funding is raised through discrete funding stages, with different forms of funding available at different stages of the development of the tech company:

- (i) ‘seed’, ‘pre-seed’, and ‘angel’ funding. This constitutes ‘the first institutional check raised by a new startup, typically in an unpriced round, prior to raising a Series A round’⁴⁵²⁰. Founding teams raise this capital from various sources: friends and family, wealthy angels, accelerator programs, and dedicated pre-seed funds;
- (ii) Early stage funding, which include all Series A and Series B rounds, as well a subset of rounds from other transaction types;

4520 See, <https://news.crunchbase.com/news/the-q2-2019-global-venture-capital-report-a-market-gone-sideways/>

- (iii) Late-stage venture is defined as ‘the set of rounds including Series C, Series D, Series E, and beyond, plus a subset of rounds from other transaction types’.
- (iv) Technology growth is a ‘private equity round raised by a company that has previously raised a “venture” round’⁴⁵²¹.

An eco-system of specialised tech funding companies has emerged in recent years to finance startups across these funding rounds. The prominent types of financial market actors in this space are noted below.

First, *venture capital (VC) firms*. VCs are the traditional entities that finance risky, uncertain startups in the technology sector. VCs invest for financial returns, being experts in ‘building companies’⁴⁵²².

VC firms, such as New Enterprise Associates, Accel, Andreessen Horowitz, Bessemer Venture Partners, GV, Index Ventures, Sequoia Capital, Bessemer Venture Partners, Tiger Global Management, or early-stage **venture funds** and seed accelerators, such as 500 startups, Plug and Play Tech Center, Keiretsu Forum are managed funds raising pools of capital (most frequently from limited partners) to fund and mentor start-ups or other young tech companies in exchange for minority equity in the company. In addition to providing financial resources, portfolio companies benefit from VCs’ strategic guidance and industry knowledge.⁴⁵²³

Tech-focused VCs grew out of a collection of individuals, and firms with a few partners, that funded start-up projects to global organizations with a number of specialists in human resources, marketing, finance, engineering, legal and investor relations to support their investment and fundraising activity⁴⁵²⁴. Their funding commitment is often structured as 10-year commitment with a period of initial investments (typically 3-6 years), with subsequent follow-on investments over the remainder of the fund’s life-cycle. Institutional VCs exercise control over their portfolio investments, often take a board seat and work closely with the leadership team.⁴⁵²⁵

The sector has been consolidating as venture capital is becoming more capital-intensive, to the extent that start-ups require more capital in a markets with large incumbents in order to achieve escape velocity. The changing nature of the VC industry means that VC is not anymore simply a syndicate of investment professionals but groups that include experts in talent acquisition, sales, product marketing and finance to accelerate venture growth⁴⁵²⁶. They intervene at all stages of the development of a company, from idea to late stage.

Second, *Corporate Venture Capital firms (CVCs)*, such as Google Ventures, Salesforce Ventures, Intel Capital, Baidu Ventures, Legend Capital, SBI Investment, have usually stra-

tegic objectives investing on the specific company and offering it an in-depth industry knowledge and access to potential customers. They can be organized as an independent arm of a company or a designated investment team off their company's balance sheet⁴⁵²⁷. They usually invest in early to mid-stage companies. Their role is usually limited in the management of the companies, often taking a board observer role.

Third, *Private Equity (PE) firms*, such as Silver Lake, Francisco Partners, and Vista Equity are often active in mature companies in traditional industries, although they are increasingly buying out also VC-backed tech companies, often taking a majority stake (50 percent ownership or more), typically through debt rather than equity.

We propose that the nature of this finance ecosystem creates a bottleneck that shapes the competitive landscape. This is related to the both the economic geography of VC and the consolidation that has occurred in the VC industry over recent years. Each of these factors is addressed in turn below.

Although there has been a degree of internationalisation in recent years, due to high levels of involvement between VCs and their portfolio companies (e.g. monitoring), VC funding is typically restricted to the geographic location of the VC firm.⁴⁵²⁸ This economic geographic perspective helps to explain the importance of the Silicon Valley area in California.⁴⁵²⁹

With respect to financial industry consolidation, at the turn of the millennium, Paul Gompers and Josh Lerner foresaw that "[t]en years from now...a handful of industry leaders will likely dominate the field – leaders who will command far greater financial and human resources than their competitors."⁴⁵³⁰ Almost twenty years later, their prediction has materialised. With capital-intensity rising, capital flows primarily to a select group of large, brand name companies.⁴⁵³¹ Such dominant firms, including the firms noted above, frequently act as 'lead investors', which are often granted a seat on the board of directors, initiate deals, contribute the most capital, and lead due diligence and value negotiation efforts.⁴⁵³²

Furthermore, the significance of these dominant firms is amplified by their ability to enhance the reputation of portfolio companies and catalyse further investment.⁴⁵³³

4527 Ibid.

4528 Although there has been a degree of internalisation in recent years, due to high levels of involvement between VCs and their portfolio companies (e.g. monitoring), VC funding is typically restricted to the geographic location of the VC firm. 4533 See generally, Stephanie A Fernhaber and Patricia P McDougall-Covin, 'Venture Capitalists as Catalysts to New Venture Internalization: The Impact of Their Knowledge and Reputation Resources' (2009) 92 *Scholarship and Professional Work*

As noted, because startups are inherently disadvantaged by a negligible performance history, potential investors have limited information on which to assess the company. Therefore, in the presence of uncertainty, investors may base part of their assessment on the reputation of those firms with which the startup is associated.⁴⁵³⁴ It is well documented that new ventures leverage the reputation of their lawyers, accountants and bankers to signal their own credibility.⁴⁵³⁵ We propose that the dominant VCs, CVCs and PEs play a similar role for tech startups, acting as quality certification providers for other investors.⁴⁵³⁶ Startups gain or suffer due to the reputation of their lead investors.⁴⁵³⁷ Evidentially, the time-to-IPO of tech startups is positively related to the reputation of VC investors.⁴⁵³⁸ Moreover, once invested in a startup, large VCs use their high 'social capital' and extensive networks to encourage other financial market participants into the investment.⁴⁵³⁹

In this respect, not all investors are of equal importance: securing investment from a prominent VC, CVC or PE can catalyse access to other financial resources and help startups overcome financial barriers to entry. These reputational and social aspects of VC financing reinforce the significance of the dominant firms, heightens barriers to entry for startups and tightens the bottleneck in the tech industry.

In a recent working paper, Ufuk Akcigit and his colleagues examine the importance of VC to the success of startups, providing empirical validation for the bottleneck narrative we propose here.⁴⁵⁴⁰ Akcigit et al observed VC-funded startups over a period of 10 years against a control group of comparable non-VC funded startups. The paper finds that VC-backed startups are characterised by higher growth rates and are more innovative, as measured by firm employment and patenting activity, respectively.

Over the observed period, average employment in VC-funded firms increased by 475 per cent compared to 230 per cent for non-VC-funded firms,⁴⁵⁴¹ while the VC-funded firms' average patent stocks grew by approximately 1100 per cent, compared to 440 per cent for the control group.⁴⁵⁴² Furthermore, the study suggests that prospects are

4541 *ibid*, 13.

4542 *ibid*, 15.

improved if startups are funded by more experienced VCs. Akcigit divide VCs into ‘high’ and ‘low’ quality, with the former being those funds that are above the 90th percentile of the distribution in terms of number of deals completed and the latter being those below this level. Startups backed by high quality VCs ended up with 32 per cent higher employment, compared to those funded by low quality VCs.⁴⁵⁴³ Moreover, the average patent stock of a startup backed by a high quality VC grew by almost 50-fold over the 10 years, versus 19-fold growth for those funded by low quality VCs.⁴⁵⁴⁴ In sum, Akcigit et al’s empirical work reaffirms that access to venture capitalist funding is a significant source of competitive advantage.

We now turn to the relevance of this bottleneck for tech startups in the BRICS context. The bottleneck is especially acute for new enterprises in Brazil, Russia, India and South Africa, where the VC industries, although growing, remain nascent. In 2018, VC investments in these jurisdictions amounted to just \$1.3bn,⁴⁵⁴⁵ \$1.2bn,⁴⁵⁴⁶ \$530m,⁴⁵⁴⁷ and \$250m,⁴⁵⁴⁸ respectively. That is, startups in these countries face significant financial barriers to entry because US-based VCs are less likely to invest in them and they do not have ready domestic alternatives. China, however, is an outlier among the BRICS.

Chinese startups enjoy a favourable financing landscape, benefitting from a well-developed VC sector and significant inflows from US VCs. The Chinese VC industry is the second largest worldwide, behind only the US.⁴⁵⁴⁹ The assets under management (AUM) of Chinese-based VC firms reached \$210 billion as of June 2018.⁴⁵⁵⁰ In 2018 Chinese startups received \$81 billion of VC funding, equal to 32 per cent of VC funding globally.⁴⁵⁵¹ Reinforcing the importance of the US VCs, American funds alone invested approximately \$19 billion into Chinese companies, participating in more than 330 funding rounds.⁴⁵⁵²

Yes	<ul style="list-style-type: none"> • According to Article 45 of the Antimonopoly law, with respect to the suspected monopolistic conduct which is under investigation by the authority for enforcement of the Anti-monopoly Law, if the undertakings under investigation commits themselves to adopt specific measures to eliminate the consequences of its conduct within a certain period of time which is accepted by the said authority, the authority for enforcement of the Anti-monopoly Law may decide to suspend the investigation. Further criteria are elaborated under Article 31 of the Interim Provisions for Prohibiting Abuse of Market Dominance and Article 22 of the Interim Provisions of Prohibiting Anticompetitive Agreements.

				They provide that when considering the application for investigation suspension, competition authorities should take account of the nature, time, effects, and social implications of the impugned conduct, as well as the remedies that the undertaking commits and the possible effects of these remedies. Article 22 of the Interim Provisions of Prohibiting Anticompetitive Agreements also provides that commitment decision should not be applied to agreements mentioned in Article 6, 7, 8, 9 of the Interim Provisions of Prohibiting Anticompetitive Agreements.
South Africa	Yes	<ul style="list-style-type: none"> The Competition Tribunal may grant an interim order if it is reasonable and just to do so, having regard to the following factors: 75 (i) The evidence relating to the alleged prohibited practice; (ii) the need to prevent serious or irreparable damage to the applicant; and (iii) the balance of convenience (article 49C of the Competition Act). 	Yes	<ul style="list-style-type: none"> Commitment Decision should address adequately the anticompetitive conduct and be 'as close as possible to that it would have achieved upon a successful prosecution of the matter in the [Competition] Tribunal' (Section 49D(1) of the Competition Act).

4554 Applied by courts, not NCA

4555 The settlement procedure maybe launched in the commercial court during appeal of the FAS's decision.

4556 In private litigations, plaintiffs are entitled to seek injunction reliefs or TROs under general civil procedure law provided the urgency and necessity were proved before a court.

Annex 4: New merger thresholds in Germany and Austria

Tobias Kleinschmit

1.1. Background of the Reform

The aim of the new provisions on transaction value thresholds, which were introduced in the area of merger control with the 9th amendment to the German Competition Act (Gesetz gegen Wettbewerbsbeschränkungen, GWB) and by the Austrian Cartel and Competition Law Amendment Act 2017 (Kartell- und Wettbewerbsrechts- Änderungsgesetz, KaWeRAG), is to adapt competition law to the structural change triggered by technical developments and international competition. Section 35 (1a) GWB and Section 9 (4) KartG introduced the criterion of merger considerations as an additional, subsidiary threshold for the notification requirement. As a result, mergers where companies or assets, which (as yet) generate little or no turnover, are purchased at a high price can now be examined under competition law. The aim of the threshold is to cover cases where current turnover and the purchase price for the company differ to a disproportionate extent. The high purchase price in such takeovers is often an indication of innovative business ideas with great competitive market potential. Market-leading companies are able to fully integrate emerging competitors or their assets into their own business by acquiring them in the early stage of their development and change or discontinue the original activities of the acquired company. From a competition policy perspective, such acquisitions may require a preventive merger investigation, especially with regard to protecting innovation potential and innovation competition in technology markets.

1.2. Modification of the German Competition Act⁴⁵⁵⁷

Originally § 35 para. 1 GWB states that:

„The provisions on the control of concentrations shall apply if in the last business year preceding the concentration

1. the combined aggregate worldwide turnover of all the undertakings concerned was more than EUR 500 million, and
2. the domestic turnover of at least one undertaking concerned was more than EUR 25 million and that of another undertaking concerned was more than EUR 5 million.“

⁴⁵⁵⁷ English Translation of the Act against Restraints of Competition provided by the Language Service of the Bundeskartellamt, available under http://www.gesetze-im-internet.de/englisch_gwb/englisch_gwb.html#p0339

The 9th amendment to the German Competition Act (Gesetz gegen Wettbewerbsbeschränkungen, GWB) added § 35 para 1a GWB, which states that

„The provisions on the control of concentrations shall also apply if

1. the requirements of paragraph 1 no. 1 are fulfilled,
2. in the last business year preceding the concentration
 - a) the domestic turnover of one undertaking concerned was more than EUR 25 million and
 - b) neither the target undertaking nor any other undertaking concerned achieved a domestic turnover of more than EUR 5 million,
3. the consideration for the acquisition exceeds EUR 400 million and
4. the target undertaking pursuant to no. 2 has substantial operations in Germany.“

1.3. Interpretation of the Provisions

Acknowledging that uncertainties persist, the German Federal Cartel Office (Bundeskartellamt) and the Austrian Federal Competition Authority (Bundeswettbewerbsbehörde) have published a Joint Guidance on the new transaction value thresholds.⁴⁵⁵⁸ This guidance paper is based on initial experience with the new thresholds, discussions with selected lawyers specialising in competition law and mergers and acquisitions and submissions received during the public consultation on a draft version of the guidance paper. The paper aims to offer users first assistance with interpreting statutory provisions and represents the current legal opinion of the Bundeskartellamt and the Bundeswettbewerbsbehörde on the applicability of the new provisions. However, it cannot bind the German and Austrian courts in their interpretation of Section 35 (1a) GWB or Section 9 (4) KartG. The Bundeswettbewerbsbehörde and the Bundeskartellamt especially respond to questions on the interpretation concerning the value of the consideration and the extent of domestic operations.

1.3.1. Value of the consideration within the meaning of Sec. 35 1a no. 3 GWB and Sec. 9 (4) KartG

1.3.1.1. Assets and monetary benefits included in the calculation

The value of consideration encompasses all assets and other monetary benefits that the seller receives from the buyer in connection with the merger in question. Considerations can consist of different items exchanged between buyer and seller in return for

⁴⁵⁵⁸ English Version of the Joint guidance on Transaction Value Thresholds for Mandatory Pre-merger Notification (Section 35 (1a) GWB and Section 9 (4) KartG) by the German Federal Cartel Office (Bundeskartellamt) and the Austrian Federal Competition Authority (Bundeswettbewerbsbehörde) is available under https://www.bwb.gv.at/fileadmin/user_upload/Downloads/standpunkte/2018-07_Guidance_Transaction_Value_Thresholds.pdf. The official version in German is available under https://www.bundeskartellamt.de/SharedDocs/Publikation/DE/Leitfaden/Leitfaden_Transaktionsschwelle.pdf?__blob=publicationFile&v=6

the acquisition of a target company. This can include cash, securities, company shares not traded as securities, other assets (real estate, tangible assets, current assets), intangible assets (licences, usage rights, rights to the company's name and trademark rights) and considerations for non-competition, for example. Considerations also include future and variable purchase price components whose amount and time of payment are contingent on the future development of certain company parameters or certain conditions. This covers earn-out payments, which depend on the development of corporate key figures, such as the EBIT, turnover or sales figures, for example. Also included are payments that are conditional on milestones agreed between the parties involved, such as the achievement of specific steps in a drug approval process, and future licence payments. Liabilities assumed by the buyer also form part of the consideration for the acquisition of a target company. In line with Mergers & Acquisitions (M & A) practice, the Bundeskartellamt and the Bundeswettbewerbsbehörde will usually add the interest-bearing portions of the liabilities to the value of the consideration.

The Joint Guide recommends different calculation methods depending on the nature of the consideration value in the specific case in question: (1) the consideration consists of cash, (2) the consideration consists of securities and (3) the consideration consists of assets other than securities or cash. Various combinations of these three case scenarios are also possible.⁴⁵⁵⁹

1.3.1.2. Relevant date for the value assessment

In contrast to a turnover analysis for a specific period of time, the value of the consideration has to be calculated for a specific point in time. The relevant factor determining whether a merger project has to be notified is the completion date of the merger. However, there may be cases where the value (of the consideration at the time of completion) has not been specified because of value fluctuations at the time of the notification. In this case, the value of the consideration submitted in the notification can relate to the time the notification requirement was reviewed by the parties to the merger. However, if the value falls below the €200m or €400m threshold after notification, the companies can withdraw their notification and complete their project without being subject to merger control. On the other hand, a merger project that was initially not subject to notification can become subject to notification, for example, if the price of the foreign currency or shares offered as a consideration rise to such an extent that they now exceed the thresholds. In these cases, an obligation to notify the merger may arise before the date of completion.

If various components of the consideration are to be paid at different times, the value of all subsequent payments, such as payments resulting from an earn-out arrangement, has to be determined with regard to the time of completion of the merger. This requires

⁴⁵⁵⁹ English Version of the Joint guidance on Transaction Value Thresholds for Mandatory Pre-merger Notification (Section 35 (1a) GWB and Section 9 (4) KartG) by the German Federal Cartel Office (Bundeskartellamt) and the Austrian Federal Competition Authority (Bundeswettbewerbsbehörde) available under https://www.bwb.gv.at/fileadmin/user_upload/Downloads/standpunkte/2018-07_Guidance_Transaction_Value_Thresholds.pdf

a particular degree of transparency to allow the calculated values to be verified. The current value of future payments at the time the notification requirement is reviewed must be calculated on the basis of discounting methods commonly used in the financial sector, such as those used in multi-period (or dynamic) capital budgeting. Future payments must be discounted to a cash value to calculate the value of the payments for a uniform date. Payments expected in the future can be uncertain in terms of their probability. If future payments have been weighted according to their probabilities in order to calculate their value, these probabilities and their underlying assumptions must be explained. If uncertainties have been taken into account by adding a premium on the discount rate, the amount of the relevant component must be specified and explained in the interest rate statement.

If the value of the consideration for a merger project was determined according to this guidance paper and the merger was considered exempt from notification as a result, the notification requirement will not be reinstated if the components of the consideration value that had already been taken into account change in value after the merger is put into effect. This may be the case if securities are exchanged, for example.

1.3.2. Substantial domestic operations

1.3.2.1. Domestic Operations

In accordance with Section 35 (1a) no. 4 GWB and Section 9 (4) KartG, these cases are subject to merger control if the company to be acquired, or significant parts of the company or assets to be acquired, have substantial operations in Germany or Austria. This is meant to eliminate cases from the scope of the provisions, which at their core relate to the takeover of a company only operating abroad.

The measurement of domestic activity requires an appropriate indicator to determine the extent to which the target company is operating on the domestic markets. In contrast to Section 35 (1) GWB and Section 9 (1) KartG, domestic activity is generally not measured on the basis of domestic turnover.

Different criteria to measure activities may be applied to different sectors and activities. A definitive list of possible criteria cannot be provided here. The measurement should be carried out in line with industry standards that cannot be easily manipulated. In the digital sector, the explanatory memoranda in Germany and Austria refer to user numbers ("monthly active users") or the access frequency of a website ("unique visitors") as examples of possible indicators. In proceedings of the Bundeskartellamt, other industry key figures, such as "daily active users" (DAU), have also been used.

Domestic activity must be a current activity. In contrast to the examination of turnover thresholds under Section 35 (1) and (1a) no. 2 GWB and Section 9 (1), (2) and (4) nos. 1 and 2 KartG, the point of reference is not the last full financial year preceding the merg

er but the target company's activity at the time the merger is put into effect. Future or anticipated activities are not sufficient.

1.3.2.2. Significance

Domestic activity within the meaning of Section 35 (1a) no. 4 GWB and Section 9 (4) no. 4 KartG must reach a significant level in addition to market orientation. The Bundeskartellamt will find that there is no significance if the target company generated a turnover below €5m in Germany and if this turnover adequately reflects its market position and competitive potential. This is likely to be the case if the company's products generate significant turnover abroad but not in Germany, for instance, because the company has not (yet) established a sales structure in Germany. In contrast to Germany, lawmakers in Austria have not set an absolute threshold of €5m. However, the Bundeswettbewerbshorde will routinely find that there is no domestic activity if the turnover of domestic target companies is below €500,000 provided that this turnover adequately reflects the market position and the competitive potential of the target company. The assessment of the degree of significance associated with the planned acquisition of research and development activities can be based on various conceivable criteria. These can include the number of staff engaged in research and development or the research and development budget, for example. The number of patents or patent citations can also be an indication. If a transaction primarily involves the acquisition of a domestic research site with sufficient domestic market orientation, it is safe to assume significant domestic activity.
